The land cover types in **Dutchess County** are primarily forested areas and surface waters, which account for 77 percent of the study area. Only 15 percent of the land area within the 45.6-mile-long study area in Dutchess County is in residential, industrial use, mixed urban use, or transportation. Agricultural, wetlands, and barren land comprise the remaining 8 percent of the study area. The Empire Corridor passes through several smaller communities including Beacon, Poughkeepsie, and Rhinebeck, which are located adjacent to the Hudson River.

In Dutchess County, the city of Poughkeepsie is located in the Hudson Valley approximately midway between New York City and Albany. The city is bordered by the Hudson River to the west and the

town of Poughkeepsie on the north, east and south. A majority of the land cover (59%) in the study area in the city of Poughkeepsie is characterized as either forested or surface water (the Hudson River). Within the central business district, the principal land uses include industrial, commercial, and mixed urban totaling approximately 23 percent of the corridor, with transportation/utilities totaling another 8 percent. Land uses around the Poughkeepsie Amtrak/Metro-North Railroad Station, 41 miles north of the Croton-Harmon Station, include several surface parking facilities for rail passengers and park users, a new residential condominium development, referred to as the Piano Factory, and the Mid-Hudson Children's Museum to the north, and a waterfront park to the west along the Hudson River side of the railroad tracks. Approximately ¼ mile to the north is the Walkway over the Hudson State Park, a former rail bridge and associated interpretive uses, spanning the Hudson River. The east side of the tracks border NY Route 9, with low to medium density housing to the east of the highway and the station.

Within Dutchess County, the Rhinecliff–Kingston Amtrak Station, 15 miles north of the Poughkeepsie Station, lies adjacent to the east bank of the Hudson River and is characterized by residential uses and the historic hamlet of Rhinecliff on its eastern side, within the town of Rhinecliff. The New Hamburg Metro-North Railroad Station is located 10 miles to the south of the Poughkeepsie Station in the hamlet of New Hamburg. The hamlet is a small community located on the Hudson River in the southwest corner of the Town of Poughkeepsie.

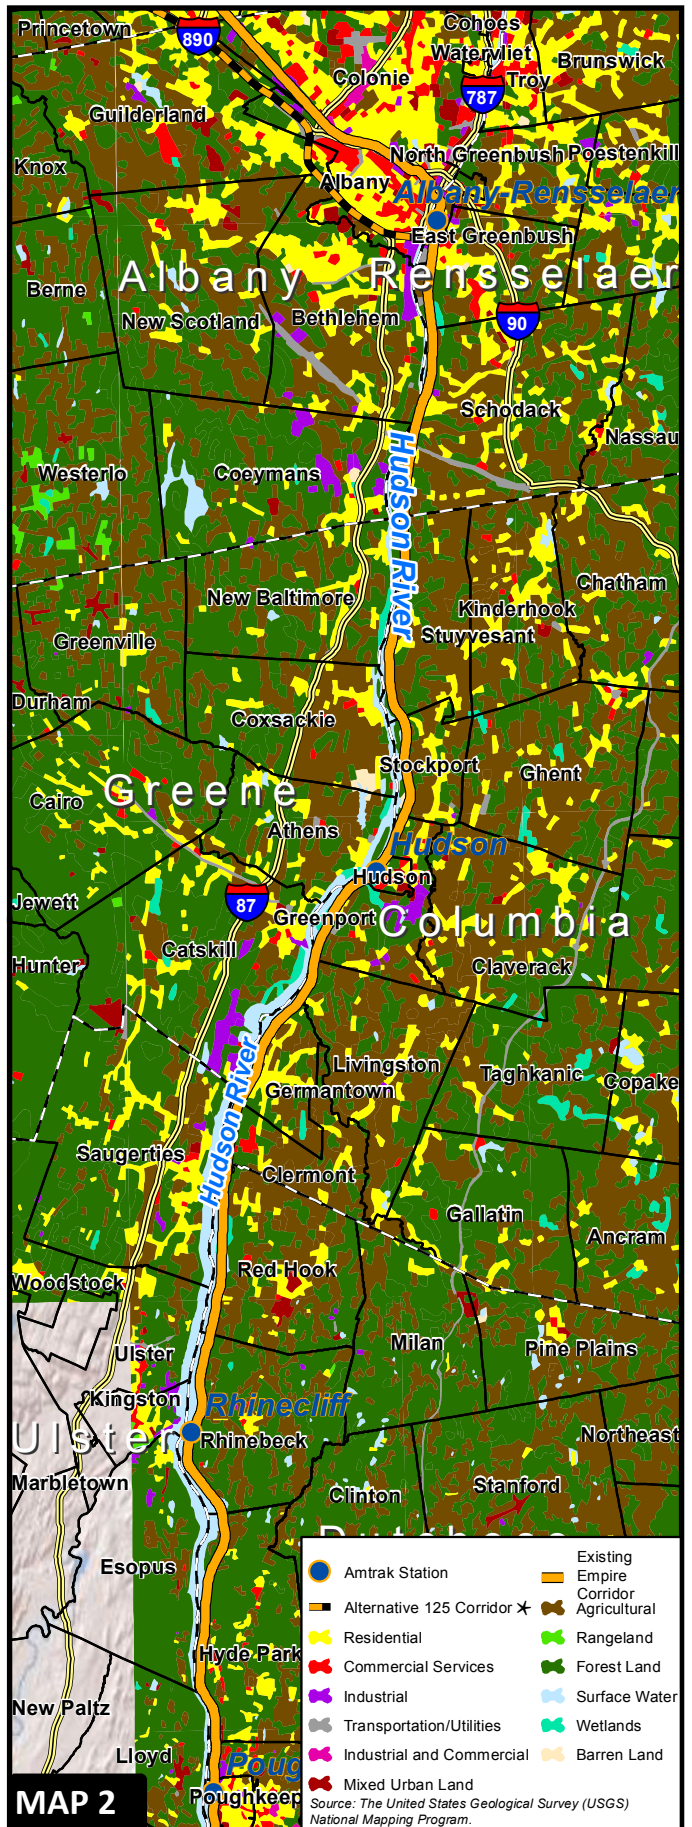

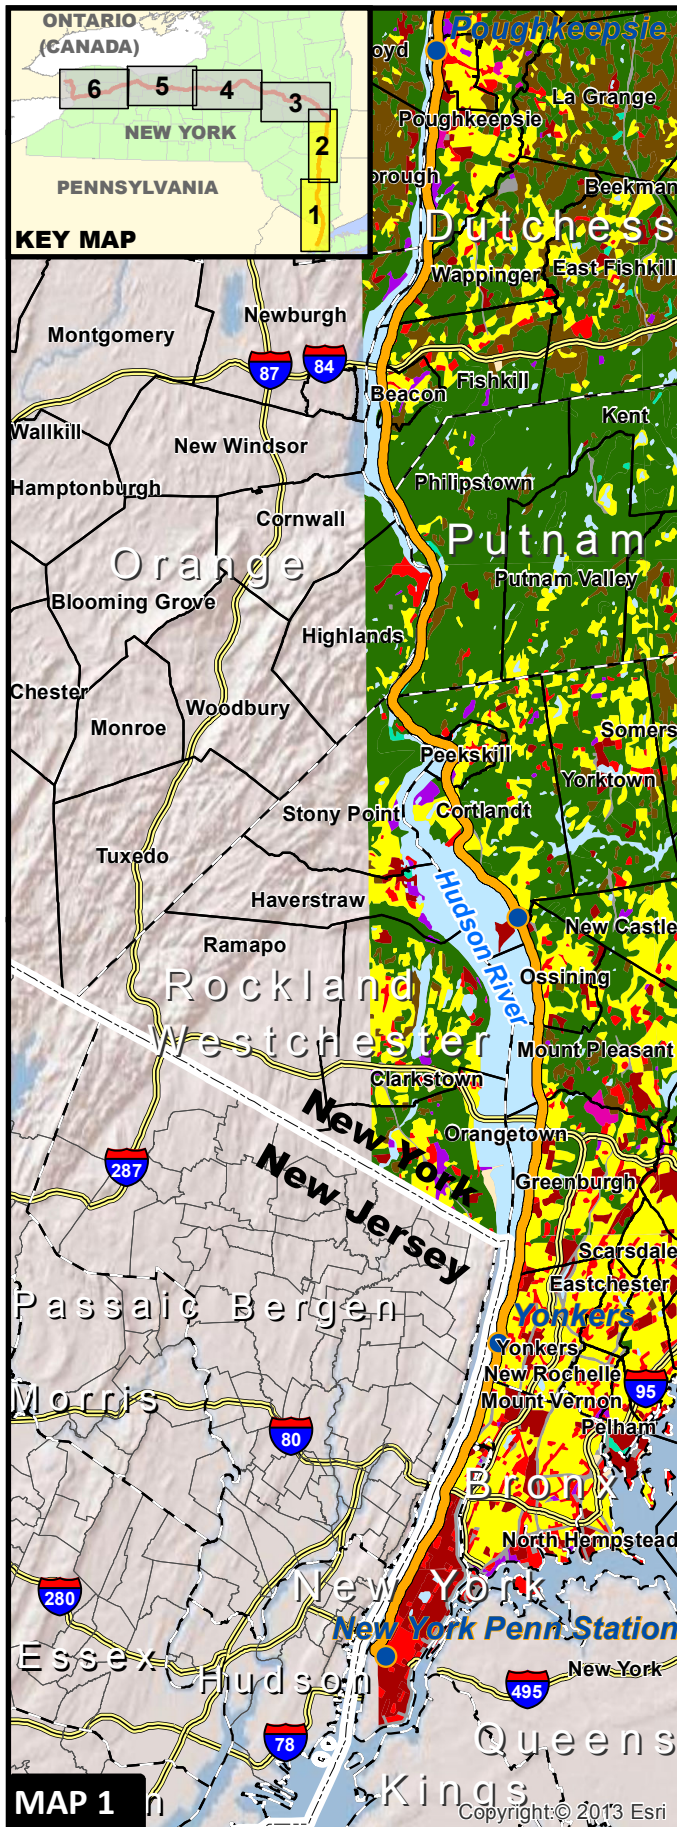

Columbia County is predominantly rural in nature within 300 feet of the railroad, which extends 29.5 miles through the county. The major land use classification is forested lands, which account for 50 percent of the study area. Nineteen percent (19%) of the corridor is developed, primarily residential and retail commercial uses, concentrated within the city of Hudson. Agricultural lands account for 19 percent of the study area.

In Columbia County, the land uses adjacent to the Hudson Station, 26 miles north of the Rhinecliff–Kingston Station, include a waterfront park and state boat ramp along the Hudson River on the west side of the track. To the east and south, the neighborhoods within the city of Hudson include the business district and residential properties. A non-profit theater (Stageworks) is located in close proximity to the station.

Rensselaer County (along with Albany and Schenectady counties along the Empire Corridor West program segment) is part of the Capital District Region. Rensselaer County is primarily rural or undeveloped within 300 feet of the existing (90/110 Study Area) rail corridor, which extends 13.4 miles through the county. In Rensselaer County, where the 125 Study Area would begin, it extends north to Albany–Rensselaer Station, doubles back on the Empire Corridor South for one mile, before turning east and crossing the Hudson River. The new 125 Study Area diverges from the existing railroad approximately 1.6 miles south of where the existing Empire Corridor West turns west (for a total of 13.5 rail miles in Rensselaer County).

In the southern part of Rensselaer County, the major land cover types are primarily forested and agricultural. Forestlands comprise 36 percent (90/110 Study Area) to 38 percent (125 Study Area) of the study area in the county. Agricultural lands comprise 28 percent (90/110 Study Area) to 30 percent (125 Study Area) of the county's land study area. The urban center of this county is the city of Rensselaer. The majority of the mix of urban uses including residential, commercial, industrial and transportation uses (30% for the 90/110 Study Area and 27% for the 125 Study Area) in the study area for the county are located within the city of Rensselaer.

Within Rensselaer County in the city of Rensselaer, the Albany–Rensselaer Station is situated about

* Alt. 125 as shown is a potential corridor used to analyze the potential operating characteristics, environmental impacts and cost for this speed (125 mph) threshold.

1.5 miles south of downtown Albany. The land uses in the vicinity of the current station include several large surface parking facilities and medium-density detached single family housing located to the west and east of the station. Areas west of the train station also include commercial, institutional, and industrial uses, including New York State Adoptive Services, and several dining establishments.

1.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

The 322-mile-long Empire Corridor West/Niagara Branch, with the exception of the metropolitan areas within and surrounding the major cities, has a rural agricultural character. The Empire Corridor West generally follows or parallels several major natural and man-made features, including the Mohawk River/New York Canal System and the New York State Thruway. The Niagara Branch turns north at Buffalo on Lake Erie, generally paralleling the Lake Erie shoreline and then extending north parallel to the Niagara River.

In Rensselaer, the railroad crosses over the Hudson River at the Livingston Avenue Bridge and enters Albany. The rail bridge crosses approximately one mile north of the Albany-Rensselaer Station. Within **Albany County**, the city of Albany is located on the west bank of the Hudson River approximately 150 miles north of New York City. Within the city limits of Albany, the land area along the corridor consists of primarily industrial and transportation/utility uses totaling 57 percent of the corridor. Commercial establishments, including warehouses and vehicle garages occupy an additional 20 percent of the corridor.

In Albany County, the land cover in the study area along the 11.8-mile-long corridor consists of a mix of mixed urban land, residential, commercial and industrial uses, comprising 47 percent of the total. The majority of these urban, developed areas are located in the city of Albany. The rail line then generally parallels the New York State Thruway (Interstate Route 90), passing south of the Albany International Airport. Transportation and utilities account for another 10 percent of study area land cover. Proceeding west beyond the Albany city limits, the land uses in the study area assume a more rural character with pockets of industrial uses (26%) with the remaining classified as undeveloped or forested areas (38%) to the west and south of Albany County.

Approximately 14.7 miles of the rail corridor extends through **Schenectady County**, where land cover in the study area is a mix of developed areas, agricultural lands and forested areas. Fifty-five percent (55%) of the corridor contains developed uses, predominantly residential, while another 43 percent consists of agricultural and forested areas.

Within Schenectady County, the city of Schenectady is approximately 15 miles northwest of Albany. A majority of the land use consists of residential neighborhoods accounting for 66 percent of the total along the corridor. Twenty-six (26%) percent of the corridor is occupied by industrial and commercial development.

Within Schenectady County, approximately 18 miles west of the Albany-Rensselaer Station, Schenectady Station is located in the heart of the downtown business district, surrounded by restaurants, theaters, and other commercial uses and services. The land uses surrounding the station consist of mixed urban uses, and the railroad crosses NY Route 5 immediately south of the station. Adjoining uses on Route 5 include the Empire State College of the State University of New York, a bank, and a U.S. Naval Reserve office.

In the remainder of Schenectady County north of the city of Schenectady, the railroad corridor crosses the Mohawk River and generally follows the river and, further to the southwest, the New York State Thruway (I-90), passing north of the Mohawk Valley Airport.

The railroad closely follows both the Erie Canal and the New York State Thruway (I-90) where it extends 40.3 miles through primarily rural areas of **Montgomery County**. The land cover types in Montgomery County are primarily forested, rangeland, or agricultural lands totaling 68% of the study corridor. Another 22 percent of the land area is classified as residential, commercial, or mixed urban lands, with much of this development centered on Amsterdam, the largest city along the railroad corridor in Montgomery County.

In Montgomery County, the Amsterdam Amtrak Station is located in the western outskirts of the city of Amsterdam, 18 miles west of Schenectady Station, on the north bank of the Mohawk River just south of Route 5/Route 67. A mixed residential and commercial neighborhood surrounds the station, and includes several medical offices, St. Mary's Hospital, a church, and other services.

The railroad extends 25.3 miles through rural areas of **Herkimer County**. The railroad follows the Mohawk River and the New York State Thruway (to the south of the river) on the eastern half of Herkimer County, and, west of Herkimer, follows the Erie Canal and the New York State Thruway (to the north of the canal). Surface waters account for 7 percent of total land area. The major land use types include agricultural lands and rangeland (40%) and forested areas (29%), totaling 69 percent of the corridor. The developed lands, principally residential and commercial land uses, are clustered in the communities of Little Falls and Herkimer.

Proceeding west, the Empire Corridor extends 28.6 miles through **Oneida County**, paralleling the Erie Canal between Utica and Rome. Wetlands account for 16 percent of the land cover. The railroad also parallels portions of the New York State Thruway (I-90) and sections of NY Routes 69, 26, and 365, and transportation accounts for 10 percent of the land cover. The county is primarily rural; agricultural lands, rangeland, and forest constitute 59 percent of the land cover in the 600-foot-wide study area. Residential, commercial, and industrial land use accounts for 15 percent of the land cover in the study area and is clustered around the urbanized portions of Utica and Rome.

Within Oneida County, the study area in the city of Utica consists primarily of transportation/utilities (48%) and commercial and industrial development (43%) totaling 91 percent. The Utica Boehlert Transportation Center, located 60 miles west of Amsterdam Station, is surrounded on the west, south, and east by commercial and industrial uses, with a few government buildings. The station adjoins the Children's Museum of History and Science on the west. The northwest side of the station adjoins the Genesee Street overpass, and industrial areas are north of the railroad tracks.

Within Oneida County, the Amtrak Rome Station is located 13 miles west of the Boehlert Transportation Center at Union Station (Utica Station), immediately south of the Erie Canal. The area around and south of the station includes commercial services and sparsely developed, agricultural areas. The station is immediately east of a bridge carrying NY Routes 26, 49, and 69 over the canal and railroad. To the north of the canal are more densely developed, industrialized areas of Rome, including the Rome Industrial Park.

The Central New York Region encompasses the counties of Madison, Cayuga, and Onondaga. The railroad extends 13.8 miles through rural Madison County, generally paralleling the Old Erie Canal and the New York State Thruway (I-90). A majority of the land cover is rural in nature, with 91

percent of the study corridor classified as forest (50%), agricultural (26%), rangeland (11%), or wetlands or barren land (5%). A small percentage of the study area in the county (7%) consists of residential or commercial use. The railroad passes five miles south of Oneida Lake in Oswego County, part of the Finger Lakes.

The Finger Lakes Region is a regional tourism destination centered on the chain of lakes that includes two that are among the deepest in America (Cayuga and Seneca Lakes), includes the study area counties of Onondaga, Cayuga, Wayne, and Monroe. The cities of Syracuse (Onondaga County) and Rochester (Monroe County) are major centers for employment, commerce and culture within this four-county region of New York State.

The railroad extends 31.3 miles through **Onondaga County**, roughly paralleling the New York State Thruway to the south and passing south of the Syracuse Hancock International Airport and Onondaga Lake in the city of Syracuse. Roughly half of the land cover in the study area in the county consists of forestland (25%), agricultural (15%), wetlands (75%), and surface water or barren land (3%). Built-up lands, consisting of industrial (15%), transportation/utilities (13%), mixed urban land (13%), and commercial/residential (10%), are largely situated within the city of Syracuse, with small pockets on the communities of Minoa on the east and Jordan on the west.

Within Onondaga County, most of the study area in the city of Syracuse is built up (94%), with only 6 percent consisting of surface waters. Mixed urban uses accounts for 63 percent of the land cover, followed by transportation/utilities (18%), industrial (10%), and commercial (3%).

In Syracuse, Amtrak serves the William F. Walsh Regional Transportation Center, which opened in 1999, and is located 41 miles west of the Rome Station. The station occupies the area on the west side of the grade-separated interchange of I-81 and NY Routes 370 and 298 at the southeast corner of Onondaga Lake. A regional shopping center (Carousel Mall) is southwest of the interchange and other retail, commercial, and industrial uses are south and east of the station. The northeast side includes MacArthur Stadium and areas to the north, on the opposite side of the tracks, include the ITT Technical Institute and residential neighborhoods. Wetlands, undeveloped/barren land, and commercial/industrial uses occupy the areas north of tracks and Ley Creek, which closely borders the northwest side of the tracks. West of the station and the I-81 Interchange area, the Onondaga Lake County Park is located along the lake shoreline.

West of the William F. Walsh Regional Transportation Center (Syracuse Station), the railroad passes close by the State Fairgrounds, on the north, and Camillus Airport, on the north, and extends through largely rural agricultural areas.

The railroad extends 11.5 miles through rural **Cayuga County**, which consists primarily of agricultural lands (77%), forestland (13%), and wetlands and surface waters (8%) in the study area. The railroad closely follows and parallels, to the south, the New York State Thruway (I-90) through the eastern half of the county, passing south of Whitford Airport in Weedsport, and crosses the Cayuga-Seneca Canal at the west end of the county. At the west end of the county, the railroad borders the Northern Montezuma Wetlands State Wildlife Management Area (WMA) and the Howland Island WMA.

The railroad extends 37.1 miles through rural **Wayne County**, which is 97 percent undeveloped in the study area, paralleling portions of the Erie Canal and NY Route 31. The land cover in the study area consists predominantly of agricultural land (61%), forestland (24%), wetlands (11%), and barren land (1%). The railroad crosses through the Northern Montezuma WMA and the Montezuma

National Wildlife Refuge.

The railroad extends 30.9 miles through **Monroe County**, closely paralleling the Erie Canal and Route 31F on the easternmost part, then roughly paralleling I-490 around Rochester and continuing west through the county. This is reflected in land cover totals for the study area, with 4 percent wetlands and 6 percent transportation/utilities. The predominant land use in the study area in Monroe County is agricultural (37%), with 6 percent forested lands. The built-up areas (44%) are centered on Rochester and the outlying communities of East Rochester, Fairport, and Gates. Developed areas in the study area consist of commercial and industrial uses (27%), residential uses (10%), and mixed urban land (7%). The railroad in Rochester extends within roughly five miles of Lake Ontario and within two miles of Irondequoit Bay on the lake. West of the city center of Rochester, the railroad passes north of the Greater Rochester International Airport, with access provided off I-390.

Within Monroe County, the city of Rochester in the study area is largely built up, with 79 percent consisting of industrial (44%), commercial (34%), and mixed urban land. Transportation/utilities accounts for 21 percent of land cover within 300 feet of the centerline of the railroad.

The Amtrak Rochester Station, located 79 miles east of the Syracuse Regional Transportation Center, is situated in the heart of the downtown area, just east of the I-490 Inner Loop crossing over the Genesee River. Access to the station from I-490 is provided by North Clinton Avenue. A new multimodal transit center is planned by the City of Rochester and Amtrak. The area south of the station and between the railroad tracks and the Inner Loop is heavily industrialized, with commercial uses, restaurants, heavy industry, and government uses (Judicial Process Commission). Directly north of the station, on the opposite side of the railroad tracks, are residential neighborhoods that are flanked by heavy industry and businesses on both the west/river side and the east, with a school within a half-mile northeast of the station.

The railroad extends 30 miles through rural **Genesee County**, closely following and paralleling NY Route 33, which generally parallels the New York State Thruway (I-90). The study area is predominantly agricultural, which comprise 84 percent of the land cover, with forest, wetlands, and surface waters comprising 8 percent. Developed lands comprise 9 percent of the study area in the county, including residential (5%), mixed urban uses (2%), and industrial and commercial uses. The built-up areas are clustered in the city of Batavia, at the geographic center of the county where many of the major highways converge, and the railroad extends south of the Genesee County Airport.

The Buffalo-Niagara region includes the counties of Erie (and the city of Buffalo) and Niagara (and the city of Niagara Falls). The railroad extends 32.7 miles through **Erie County**. The eastern segment follows NY Route 33, then NY Route 130 to the city of Buffalo, a distance of 20 miles. The railroad alignment turns north to follow the Lake Erie shoreline and then follows Route 265 north, roughly parallel to the Niagara River, a distance of 12.7 miles. The eastern 10 miles of the study area is predominantly undeveloped (33%), comprised of agricultural lands (27%) and forest (6%). The remainder of the study area in the county is primarily developed (65%) coinciding with development in and surrounding the village of Depew and town of Cheektowaga on the eastern outskirts of Buffalo, the city of Buffalo, and, to the north, Tonawanda near the Niagara County border.

Within Erie County, the city of Buffalo is entirely urbanized within the study area, with 53 percent industrial uses, 24 percent commercial services, and 16 percent transportation/utilities. Two stations in Buffalo provide Amtrak service, the Buffalo-Depew Station, on the eastern outskirts of Buffalo, 61 miles west of the Rochester station, and the Buffalo-Exchange Street Station, 6 miles further west in downtown Buffalo.

Within Erie County, the Buffalo-Depew Station is located in the village of Depew, which is east of the town of Cheektowaga, the second largest suburb of Buffalo. The station is situated in a warehouse/industrial area located between Walden Avenue and Broadway (NY Route 130), which parallels the railroad, just west of Dick Road. The area immediately to the east consists of landlocked undeveloped land and wetlands between two railroad lines. Areas surrounding the station and tracks are industrial and commercial, with a variety of services and large businesses and warehouses in this industrialized zone. North and east of the industrial zone are residential neighborhoods along and adjoining Scajaquada Creek, which parallels the railroad. South of NY Route 130 is undeveloped lands and wetlands along Cayuga Creek, and a large gravel pit/mining operation is located to the southwest. The station is approximately 1 ½ miles south of the Buffalo-Niagara International Airport, with access from the station provided by Dick Road.

Within Erie County, the Buffalo-Exchange Street Station is located in the heart of downtown Buffalo, within the northwest quadrant of the I-190/NY Route 16 Interchange, which is directly east of the I-190/NY Route 5 Interchange. The station is situated south of Exchange Street adjoining the interchange ramps, and is directly south of a parking garage and the Coca Cola Field baseball stadium. To the northwest are the One HSBC Center, the Canadian Consulate and the Buffalo-Niagara Visitor Center. Immediately south of I-190 and the station are offices for the Associated Press and a Disability Benefits office, and the two blocks to the south are occupied by parking lots and the HSBC Arena and Ira G. Ross Aerospace Museum. To the east, on the opposite side of two sets of ramps for NY Route 16 and Carroll Street/Center Street/Elm Street are businesses, government offices, and the Buffalo Transportation Museum. To the west are the site of the former Buffalo Memorial Auditorium and elevated ramps for the I-190/NY Route 5 Interchange. On the other side of this interchange and south of the HSBC Arena is the Buffalo River waterfront, which outlets into Lake Erie to the northwest.

The railroad extends 14.4 miles through **Niagara County**, to the north of Erie County. The railroad follows the shoreline of the Niagara River, then extends north towards the Niagara Falls International Airport and turns west north of the airport to the western terminus of the Empire Corridor at Niagara Falls. Approximately half of the land cover in the study area is undeveloped, with agricultural uses and undeveloped land (50%) predominating in the stretch between the city of North Tonawanda, on the south end of the county, and the city of Niagara Falls on the northwest. Remaining land uses that predominate in the two cities on either end of the county consist of commercial and industrial uses (19%), residential development (12%), transportation/utilities (11%), and mixed urban land (9%).

Within Niagara County, the Amtrak Niagara Falls International Railway Station and Intermodal Transportation Center (Niagara Falls Station) is located 26 miles north of the Buffalo-Exchange Street Station at the northern terminus of the railroad on the east side of the Canadian border at the Niagara River. The station extends between NY Route 104 and Whirlpool Street, which bracket a primarily industrial and commercial zone surrounding the station, with residential and mixed uses predominating east of NY Route 104 and south and north of the station. Adjoining uses surrounding the station include automotive uses, retail uses, and apartment buildings.

1.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

The 125 Study Area, extending 308 miles from the Rensselaer County line to Niagara Falls, takes a more direct route than Empire Corridor West through rural and agricultural areas between Rensselaer County and Buffalo. The 125 Study Area bypasses several of the major metropolitan areas

and existing stations along the Empire Corridor West, with the exception of two 16-mile sections roughly centered on the Syracuse and Rochester metropolitan areas.

The 125 Study Area bypasses the existing corridor over a distance of 126 miles between Rensselaer County and a point 8.5 miles east of the Syracuse Station. The 125 Study Area extends south of the existing corridor (by approximately 1.6 miles on the existing railroad along the Hudson River up to 14 miles at Amsterdam Station) to bypass the cities and Amtrak Stations in Schenectady, Amsterdam, Utica, and Rome. West of the Syracuse area, the 125 Study Area bypasses, and extends up to 7.5 miles north of, the Empire Corridor West over a distance of 62 miles, before merging again with the existing rail corridor east of Rochester. West of Rochester, the 125 Study Area bypasses, and extends up to 7 miles north of, the existing corridor over a distance of 51 miles, before rejoining the existing rail corridor at a point 5 miles east of Buffalo-Depew Station in Buffalo.

Within the study area in **Albany County**, the city of Albany, along the west bank of the Hudson River, is primarily urban. The 125 Study Area crosses the Hudson River to closely parallel I-787 and, further west, I-87 (New York State Thruway), in the interchange area, continuing west along the median of the New York State Thruway (I-87/I-90) through the city. This is reflected in the transportation/utility uses totals for the city's land cover, which accounts for 55 percent of the 600-foot study area. The remainder of the study area consists of residential, commercial, and industrial uses (23%), and forestland, barren land, and surface water (21%). On the western end of the city and continuing west of the city, the New York State Thruway and rail corridor adjoin the Albany Pine Bush Preserve, a state unique area.

The 125 Study Area extends through 14 miles of Albany County, continuing to follow the median of the New York State Thruway (I-87/I-90) through the remainder of the county. This is reflected in the predominance of transportation/utilities (66%) within the 600-foot-wide study area. The remainder of the study area in the county consists of 18 percent undeveloped areas (forest, agricultural, barren land, or water), and 16 percent developed areas, of which residential accounts for 10 percent.

The 125 Study Area extends a total distance of 17 miles through **Schenectady County**, bypassing the city of Schenectady and the existing Schenectady Station, located 3.3 miles to the north. The 125 Study Area continues along the New York State Thruway (I-90) a distance of approximately 4 miles into Schenectady County to the junction with I-88. This portion of the corridor accounts for the transportation utilities (10%), residential (7%), and commercial (4%) totals in the county. The majority of land cover in the county consists primarily of agricultural lands (51%) and forestlands/rangeland (28%), which accounts for land cover along the remainder of the corridor. The 125 Study Area passes north of the Duaneburg Airport, then closely parallels U.S. Route 20 along the western 5 miles of the county.

The 125 Study Area extends 6.5 miles through **Schoharie County**, closely paralleling U.S. Route 20 through the eastern half. The 600-foot-wide study area in the county is primarily agricultural (47%) or forestland (41%), with mixed urban uses (12%) located in Esperance and Sloansville.

The 125 Study Area extends 21.3 miles through the southern portion of **Montgomery County**, through predominantly agricultural (71%) and forested (25%) lands. The remaining 4 percent of the county land cover within 300 feet consists of wetlands. The 125 Study Area bypasses the city of Amsterdam and Amtrak Amsterdam Station, located approximately 15 miles to the northeast.

The 125 Study Area extends 25.3 miles through the southern portion of **Herkimer County**, roughly

paralleling Route 168 on the eastern half of the county and extending north of the Frankfort-Highland Airport on the west end of the county. The study area in Herkimer County is predominantly undeveloped (97%), consisting largely of forestland (52%) and farmland or rangeland (45%). Mixed urban/residential land comprises only 3 percent of the study area. This corridor largely bypasses development centered along the existing railroad, including the communities of Herkimer and Little Falls.

The 125 Study Area extends 22 miles through **Oneida County**, extending approximately 4 miles south of the Utica Station and 7 miles south of the Rome Station. The study area is predominantly rural (94%), consisting of agricultural (58%), forestland (31%), and wetlands (6%). Mixed use and residential uses comprise 6 percent of the total land cover.

The 125 Study Area extends 14.6 miles through **Madison County**, paralleling the existing rail corridor to the south. The corridor parallels Route 5 to the south through the eastern 2/3 of the county. The study area consists predominantly of agricultural lands (64%), with forestland, rangeland, and barren land comprising 29 percent. Mixed urban land, residential, and commercial uses comprise only 5 percent of the land cover in the study area.

The 125 Study Area extends a distance of 31.6 miles through **Onondaga County**, merging back with the existing railroad corridor over a distance of approximately 16 miles around the Syracuse Station. The 125 Study Area extends approximately 4½ miles west on new alignment until it meets the existing Empire Corridor West, then follows the existing railroad approximately 9¼ miles to the Amtrak Syracuse Station at the northernmost city limit. West of the station, the 125 Study Area follows the existing railroad over a distance of 6.4 miles through the Syracuse area, before diverging at the Camillus Airport to the north of the existing railroad.

Onondaga County study area includes agricultural lands (26%) and forestlands (26%), and other undeveloped areas (10%), such as wetlands, barren land, and water, located largely on the eastern and western ends of the county outside Syracuse. The Syracuse study area includes much of the developed areas (38%) in the county, including industrial (11%), transportation/utilities (10%), mixed urban (10%), commercial (5%), and residential (2%). The study area within the city of Syracuse includes 6 percent mixed urban land, 18 percent transportation/utilities, and 13 percent industrial/commercial. The existing rail corridor adjoins the southern edge of Onondaga Lake and its adjoining county park and the State Fairgrounds. Surface waters account for 6 percent of the study area in the city.

The 125 Study Area extends through **Cayuga County** over a distance of 11 miles, on a route north of the existing rail corridor that is largely undeveloped. The predominant land cover in the study area is agriculture (72%), with forestland (18%), wetlands (7%), and surface waters (1%) comprising 26 percent. Transportation/utilities accounts for 1 percent of the land cover.

The 125 Study Area extends 35.5 miles through **Wayne County**, through areas that are predominantly rural. Agricultural uses comprise 66 percent of the 600-foot-wide study area, followed by forestland (23%), and wetlands (8%). The 125 Study Area extends within a half-mile north of the Montezuma National Wildlife Refuge. Developed land (mixed urban, residential, commercial, and industrial uses) comprises only 4 percent of the total study area.

In **Monroe County**, the 125 Study Area merges with the Empire Corridor West approximately three miles west of the county line in Fairport. The 125 Study Area follows the existing railroad corridor approximately 10¼ miles to the Amtrak Rochester Station, extending north of the Greater

Rochester International Airport, then diverges to the north approximately 5.7 miles west of the station. The 125 Study Area extends north of the Churchville County Park at the western county line. Agricultural uses (44%), forestland (11%), wetlands (3%), and barren land (1%) in the study area are located primarily outside the Rochester city limits. Residential uses and transportation/utilities, and mixed urban land account for 22 percent of the study area. The majority of commercial and industrial development, which comprises 20 percent of the study area, is centered on Rochester. Within the city limits, land uses in the study area consist of industrial development (39%), commercial services (30%), transportation/utilities (19%), residential (12%), and mixed urban uses (1%).

The 125 Study Area extends 29.7 miles through **Genesee County**. The corridor extends north of the Genesee County Airport in the center of the county, turning to the southwest to parallel the New York State Thruway (I-90) on the west end of the county, extending within one mile south of the Tonawanda Indian Reservation. Genesee County is predominantly rural (96%) in the study area, with 84 percent agricultural, 6 percent wetlands, 5 percent forestland, and only 5 percent residential, mixed urban, and industrial uses.

In Erie County, the 125 Study Area extends approximately 11½ miles before merging back with the Empire Corridor West, 4.6 miles east of the Buffalo-Depew Station. The 35.3 miles of the 125 Study Area in Erie County is predominantly urban, with the exception of the segment on the new alignment. This eastern segment accounts for the majority of the agricultural (37%) and forestland (9%) along the 125 Study Area in the county. Development within the village of Depew, Cheektowaga on the eastern outskirts of Buffalo, the city of Buffalo, and, to the north, Tonawanda near the Niagara County border accounts for the majority of development (47%) within the study area in the county, consisting of industrial (17%), residential (14%), commercial (10%), and mixed urban/transportation (7%). Barren land, wetlands, and surface waters comprise 5 percent of the study area. Within the city of Buffalo, land cover in the study area is entirely built out, consisting of industrial development (37%), residential (30%), commercial (17%), transportation/utilities (11%), and mixed urban (5%).

The 125 Study Area follows the Niagara Branch 14.4 miles through Niagara County, where land uses in the city of North Tonawanda on the south end and the city of Niagara Falls on the northwest are predominantly developed. Commercial and industrial uses account for 19 percent of the study area, followed by residential uses (12%), transportation/utilities (11%), and mixed urban land (9%). The undeveloped areas of the study area are located primarily between the two cities and consist of agricultural (46%) and barren land (4%).

Exhibit G-2—Consistency Evaluation under the New York State Smart Growth Infrastructure Policy

Criterion A: To advance projects for the use, maintenance or improvement of existing infrastructure.
Consistent. The purpose of the High Speed Rail Empire Corridor program is to introduce higher passenger train speeds on the existing rail corridor from New York City to Buffalo/Niagara Falls and provide improvements in travel time, frequency, and reliability. The program includes projects to improve existing infrastructure in addition to building new tracks, crossovers, and stations, among other improvements.
Criterion B: To advance projects located in municipal centers.
Consistent. Projects under this program are located in multiple municipal centers, including New York's six largest metropolitan areas (New York City, Buffalo, Rochester, Yonkers, Syracuse, and Albany).

Exhibit G-2—Consistency Evaluation under the New York State Smart Growth Infrastructure Policy

Criterion C: To advance projects in developed areas or areas designated for concentrated infill development in a municipally approved comprehensive land use plan, local waterfront revitalization plan and/or brownfield opportunity area plan.
Consistent. The program reviewed regional and local master plans for communities along the Empire Corridor and found that most of them explicitly endorse the implementation of improvements to intercity transit and support the concentration of development along transportation corridors.
Criterion D: To protect, preserve and enhance the state's resources, including agricultural land, forests, surface and groundwater, air quality, recreation and open space, scenic areas, and significant historic and archeological resources.
Consistent. The long-term benefits of removing vehicles from the road by providing improved public transit options will lead to a <i>net positive impact on energy and greenhouse gas emissions</i> . The Preferred Alternative, Alternative 90B, would result in an annual reduction of approximately 391,000 Btu and approximately 33,000 metric tons of CO _{2e} over the Base Alternative. Impacts to the state's resources would be minimal as the Preferred Alternative largely involves work within the existing right-of-way. NYSDOT will assess specific impacts on the above resources in more detail during the Tier 2 assessment as the program design is refined, and work to avoid and minimize impacts as much as practicable. In the Tier 2 analysis, NYSDOT will develop <i>appropriate mitigation measures through restoration, enhancement and/or preservation of these resources</i> in coordination with the appropriate agency and/or landowner.
Criterion E: To foster mixed land uses and compact development, downtown revitalization, brownfield redevelopment, the enhancement of beauty in public spaces, the diversity and affordability of housing in proximity to places of employment, recreation and commercial development and the integration of all income and age groups.
Consistent. Secondary mixed-use development may be fostered near capital improvements to stations, particularly in the instance of a station relocation/new station building, such as the Schenectady, Rochester, Niagara Falls, Amsterdam and Buffalo-Depew stations. Site selection for station relocation focused particularly on <i>economic benefits to a downtown business district</i> . New station buildings also have the potential to contribute to the enhancement of beauty in public spaces by creating distinct architectural landmarks in a city. The proposed improvements to the Empire Corridor will make rail travel a more viable commuting option for workers and <i>NYSDOT will look to maximize opportunities for Transit-Oriented Development (TOD) as part of future station projects</i> , thus fostering a diversity of housing options in proximity to places of employment. Each of the Metropolitan Planning Organizations (MPOs) and cities that will be impacted by the program support rail improvements as a catalyst for TOD and mixed-use development along transit corridors.
Criterion F: To provide mobility through transportation choices including improved public transportation and reduced automobile dependency.
Consistent. The purpose of this program is to improve rail service along the Empire Corridor between New York City and Buffalo/Niagara Falls, and the program's performance objectives relate directly to improving transportation options and access. These include <i>improving system-wide on time performance; reducing travel time</i> along all segments; <i>increasing the frequency of service</i> along Empire Corridor West; attracting additional passengers; reducing automobile trips and highway congestion; and <i>minimizing interference with freight rail operations</i> . All the evaluated alternatives will expand public transit availability along the corridor, <i>providing regional travel benefits</i> by increasing transportation choices and reducing automobile dependency.
Criterion G: To coordinate between state and local government and intermunicipal and regional planning.
Consistent. <i>A review of local, county, and state comprehensive plans and long-range transportation plans show that many of them indicate explicit support for the high speed rail improvements proposed for the Empire Corridor.</i> NYSDOT and FRA invited 37 NEPA cooperating and/or participating agencies to provide input throughout the duration of the program. NYSDOT also formed the Empire Project Advisory Committee (EPAC) with representatives from key agencies, statewide government organizations, major railroads, metropolitan planning organizations and other key stakeholders to help shape and guide decision-making throughout the environmental review process.
Criterion H: To participate in community-based planning and collaboration on the project.
Consistent. NYSDOT developed and has implemented a multifaceted Public Involvement Plan to engage and inform the public, key stakeholders, and government agencies at key milestones throughout the planning process. As part of this plan, NYSDOT has developed a stakeholder database media outreach plan, program website, and three informational newsletters to share updates and promote attendance at public meetings. NYSDOT has held six public scoping meetings to date in the major population centers along the corridor (New

Exhibit G-2—Consistency Evaluation under the New York State Smart Growth Infrastructure Policy

York City, Albany, Syracuse, Rochester, Buffalo, and Utica), and posted briefings of the meetings online for those unable to attend. Comments on the Tier 1 Draft EIS were solicited by holding six public hearings held in Albany, Syracuse, Buffalo, Rochester, Utica, and Poughkeepsie and by eliciting comments through the program website.

Criterion I: To ensure predictability in building and land use codes.

Not applicable.

Criterion J: To promote sustainability by strengthening existing and creating new communities which reduce greenhouse gas emissions and do not compromise the needs of future generations, by among other means encouraging broad based public involvement in developing and implementing a community plan and ensuring the governance structure is adequate to sustain and implement.

Consistent. This program would strengthen existing communities by providing additional commuting and other travel options for residents and workers. Improving transportation access could increase both the number of jobs available to residents within the corridor as well as the ability of workers to access work locations. Providing options for travelers and connecting major metropolitan areas will improve the quality of life for Empire Corridor residents and workers. One of the main goals of the program is to improve environmental quality by facilitating rail use and reducing reliance on automobile travel, thereby reducing fuel use and greenhouse gas (GHG) emissions. This program is not only projected to increase passenger ridership but also to facilitate freight rail use and future growth in rail. For each one percent increase in long-haul freight that changes from truck to rail, fuel savings would be approximately 111 million gallons per year and annual GHG emissions would fall by 1.2 million tons.

Exhibit G-3—Consistency Summary of State and County Master Plans

Master Plans	Rail Transportation Objective
State Plans	
New York State Rail Plan – Strategies for a New Age (2009), New York State Department of Transportation (NYSDOT)	This Statewide Plan <i>recommends the development of High Speed Rail and infrastructure improvements to the Empire Corridor</i> from NYC Penn Station to its terminus at Niagara Falls Station. The overall objectives are to improve efficiency, lower service costs for the commuter, provide enhanced intercity passenger service and improve freight rail operations.
Multimodal Transportation Program Submission: 2009-2014 (March 2008), New York State Department of Transportation (NYSDOT)	This program <i>identified actions needed to improve rail service along each of its corridors including; service frequency, and improved on-time performance along its rail corridors.</i>
NY State's Transportation Master Plan for 2030 (2006), NYSDOT	The plan states that: " <i>Intercity rail passenger ridership along the Empire Corridor (New York City-Albany Buffalo) where 90 percent of the State's intercity rail ridership is concentrated, has increased almost 26% since 1995 with annual boardings totaling 1.2 million in 2003. Intercity passenger rail service has long been an important component of New York State's transportation system and the State will continue to work with Federal officials to help address this essential service.</i> " The plan asserts that future transportation investments shall <i>respond to demographic, economic and travel trends, prioritize environmental sustainability, reliability, and safety</i> , while focusing <i>on the State's most critical multimodal corridors.</i>

Exhibit G-3—Consistency Summary of State and County Master Plans

Master Plans	Rail Transportation Objective
New York State Transportation Plan - Five Year Project List (FY 2015/16 through 2019-2020) (2016), NYSDOT	The plan states that NYSDOT agreed that \$130 million in new capital investments would be provided from 2015-2016 through the 2019-2020 plan period for passenger and freight rail. This plan allocates matching funds for improvement projects funded by FRA. Remaining funds will be allocated based on statewide solicitation of projects that are eligible and feasible, and consistent with the State Rail Plan (SRP), that include public outreach and stakeholder involvement, have a positive cost/benefit ratio and that demonstrate the ability to leverage non-State investment.
Metropolitan Planning Organization/County Plans	
New York and Bronx Counties 2010 - 2035 NYMTC Regional Transportation Plan – A Shared Vision for a Shared Future (2009) Regional Transportation Plan: Plan 2045 Maintaining the Vision for a Sustainable Region (2017) New York Metropolitan Transportation Council (NYMTC)	NYMTC <i>supports upgrading intercity rail service along the Empire Corridor</i> as part of its Strategic Regional Investment Options as noted in the Plan 2035. Plan 2045 lists completing planning of the <i>Empire Corridor intercity passenger rail improvements</i> as a near-term action and recommended major improvement that will improve the regional economy. The RTP supports and encourages the use of TOD development near existing and planned transit stations and hubs.
Westchester County Westchester 2025/Plan Together: a partnership for Westchester’s future (May 2008, amended January 2010)	This policy plan <i>endorses increases in opportunities for transit service and regional mobility</i> . No specific mention of HSR.
Putnam County Vision 2010: Guiding Putnam into the Next Decade, Putnam County Division of Planning and Development, Vision 2010 Steering Committee (August 2003)	The plan <i>supported to continue to work with Metro-North to improve service and expand ridership along the Hudson Line</i> . No mention of HSR. The plan also recommended continued participation in the New York Metropolitan Transportation Council (NYMTC).
Dutchess County Moving Dutchess 2: 2016 Metropolitan Transportation Plan (Adopted March 24, 2016) Prepared by the Poughkeepsie- Dutchess County Transportation Council	One of the Plan’s goals is to maintain the transit system in a state of good repair and increase ridership to reduce traffic and promote sustainable development. The Plan recommends improving multimodal connectivity to transit services, including commuter rail. Focus new development in existing growth centers and along major transit corridors.
Columbia County City of Hudson Comprehensive Plan: Diversity Through Balance (April 2002)	One of the goals of the Plan is to <i>improve and strengthen gateways to the City. One of these is to improve access and use of the existing Amtrak Station in Hudson</i> .

Exhibit G-3—Consistency Summary of State and County Master Plans

Master Plans	Rail Transportation Objective
Albany – Rensselaer Counties 2050: New Visions for a Quality Region, (2020) adopted September 3, 2020 Comprehensive Economic Development Strategy for the Capital District: 2018-2022 (adopted January 17, 2018) prepared by Capital District Regional Planning Commission (September 2009)	<p>The Plan recommends investment in high speed rail as part of the goal of improving regional transit and providing essential mobility for all.</p> <p>The Plan calls for <i>encouraging development along major transit corridors</i>.</p> <p>The Strategy calls for improvements to existing public utilities and facilities, including rail as a cost-effective way to bolster economic growth.</p> <p>The Strategy also supports efforts that <i>maximize the potential of the Region as the major transportation and distribution center in the Northeast</i>.</p>
Schenectady County Refer to discussion above under Albany-Rensselaer.	<p>The Capital District Transportation Authority (CDTA) rebuilt the Schenectady Station in 2018 on the site of the former station. This new station would serve Amtrak and local transit service.</p>
Montgomery County City of Amsterdam Comprehensive Plan, Prepared by Saratoga Associates and the Montgomery County Department of Planning and Development (2003)	<p>The County is currently preparing a Comprehensive Plan that will emphasize Smart Growth and Transit-Oriented Design for new developments. Although Montgomery County has not yet finalized a Comprehensive Plan, the City of Amsterdam has developed a Comprehensive Plan. Amsterdam's Comprehensive Plan <i>recommends relocating the Amtrak Station to a more central location</i>.</p>
Herkimer - Oneida Counties Herkimer-Oneida Counties Long Range Transportation Plan, Destinations 2010-2030 (2009) Going Places, Herkimer-Oneida Counties Long Range Transportation Plan 2020-2040 (2019) prepared by the Herkimer-Oneida Counties Transportation Study (HOCTS)	<p>The 2009 Study recommends continuing efforts to upgrade the physical appearance and operations of Union Station in Utica. The HOCTS <i>supports plans for High Speed Rail service</i> and its potential impact on the two counties. The plan recommended public awareness of the use of rail as a means of travel.</p> <p>The 2019 Study recommends expanding intercity transportation, investing in preserving and maintaining the existing rail assets, and implementing station enhancements at existing stations of Utica and Rome.</p>
Madison County Coordinated Public Transit-Human Services Transportation Plan, Madison County, NY - prepared by Madison County Planning Department (May 2010)	<p>Madison County has prepared a coordinated transportation plan for local transit services. There is no passenger rail service in Madison County, situated between Syracuse and Utica stations.</p>
Onondaga County 2050 Long Range Transportation Plan: Syracuse Metropolitan Planning Area-2020 Update (adopted by SMTC Policy Committee in September 23,2020) prepared by the Syracuse Metropolitan Transportation Council (July 2011)	<p>The LRTP <i>supports the use of High Speed Rail for improving passenger rail service in Central New York</i> and improving the Syracuse metropolitan area economy. The plan supports improvements at the William F. Walsh Regional Transportation Center in order to provide convenient intermodal connections to high speed trains. The plan's objectives include improving transit on-time performance, maintaining transit assets in state of good repair, and improving transit options for off-peak commuters.</p>

Exhibit G-3—Consistency Summary of State and County Master Plans

Master Plans	Rail Transportation Objective
Cayuga County -Cayuga County Comprehensive Plan (1997) -Community Visioning Forum on Economic Development (July 29, 2009)	The County has been addressing an update of its Comprehensive County Plan through a series of visioning forums. The Forum on Economic Development indicated support for rail infrastructure and transportation throughout the County.
Wayne County -Wayne County Master Plan (1997) -Wayne County Comprehensive Plan Public Opinion Survey prepared by Wayne County Planning Department (2004)	A Public Opinion Survey performed in 2004 for an update of the Wayne County Comprehensive Plan established economic revitalization as a priority and pointed out need for railroad station in Lyons/the county. The County has been attempting to establish an Amtrak Station in the Village of Lyons which would service the Finger Lakes region . This station would be located between Rochester and Syracuse Stations .
Genesee and Monroe Counties -2040 Long Range Transportation Plan for the Genesee –Finger Lakes Region Genesee-Finger Lakes Region Coordinated Public Transit-Human Services Transportation Plan Update (August 2011) prepared by the Genesee Transportation Council (June 2011) -Genesee County Comprehensive Plan (1997) is in the process of being updated as part of Genesee 2050, the county comprehensive plan update -	The LRTP is supportive of establishing high speed passenger rail service on the Empire Corridor . The plan states that for high speed rail to be feasible, it must save time for existing riders, attract new riders from other modes and not interfere with freight operations. The objective of the Coordinated Public Transit-Human Services Transportation Plan Update is to update local and regional transportation needs and continue to develop a more efficient, integrated and coordinated network of service.
Erie and Niagara Counties Framework for Regional Growth – Erie and Niagara Counties, New York, Final Report (October 2006) prepared by Erie and Niagara Counties 2035 Long-Range Transportation Plan (LRTP) Update (May 2010) for the Erie and Niagara Counties Region Moving Forward 2050: A Regional Transportation Plan for Buffalo Niagara (May 2018) prepared by Greater Buffalo-Niagara Regional Transportation Council	The Regional Growth Plan and Long-Range Plan support maintaining existing transportation system to support current and future development through reuse of existing facilities and encouraging concentration of employment and activity sites within transit corridors . The plan also promotes... improving multi-modal facilities and system connectivity to capitalize on growing international and trans-border trade opportunities . The 2050 LRTP identifies the Empire Corridor High Speed Rail between Buffalo and New York City as an additional investment opportunity to consider that would be pursued with program sponsors. In 2016, the City of Niagara Falls/NYS DOT built a new multimodal facility at the U.S. Customhouse to replace an existing facility.

Exhibit G-3—Consistency Summary of State and County Master Plans

Master Plans	Rail Transportation Objective
Major Cities	
City of New York PlaNYC 2030, Prepared by NY Metropolitan Transportation Council , Update April 2011 OneNYC 2050: Building a Strong and Fair City (April 2019)	PlaNYC <i>supports improvements to the Empire Corridor</i> and the reintegration of transportation planning and land use development at the local and regional levels. Use of TOD is emphasized as an appropriate use of land near train stations. OneNYC 2050 supports increasing reliable, sustainable, and convenient transit access in New York City. The plan supports increased rail transit capacity into the Manhattan Central Business District, including upgrades and expansions to New York Penn Station.
City of Poughkeepsie City of Poughkeepsie Comprehensive Plan (November 1998) Poughkeepsie Town Plan and Final Generic Environmental Impact Statement (2007)	The 1998 Plan recommended the <i>introduction of a Trolley Shuttle bus from Main Street to the Waterfront to improve access to the Metro-North train station.</i> The 2007 Plan supports improved access to public transportation. The Plan recommends encouraging use of city bus, which provides local and countywide access to the Metro-North and AMTRAK station.
City of Albany Albany 2030: The City of Albany Comprehensive Plan (Adopted April 2, 2012)	One of the six vision components to Albany 2030 is making Albany a multimodal transportation hub. The plan supports <i>the development and implementation of the federally-designated High Speed Rail Empire Corridor.</i>
City of Schenectady City of Schenectady Comprehensive Plan 2020: Reinventing the City of Invention (Adopted March 2008)	The Plan Implementation Program indicated that the City would be interested in <i>improving the Amtrak Station facility to create a quality transportation center with efficient intermodal connections.</i>
City of Utica Utica Master Plan (2010, adopted October 5, 2011)	The Master Plan supports the formation of a multimodal facility at the former Utica Railroad Station principally for bus and taxi. No mention of HSR or train station upgrades in the plan.
City of Rochester Rochester Amtrak Station Revitalization Study (March 2002) prepared for the Genesee Transportation Council Rochester 2034: Where the River Flows Comprehensive Plan (Adopted November 12, 2019)	Rochester 2034's placemaking principles include strengthening multimodal travel and focusing development along key transportation corridors. A new intermodal transit center was built at the existing Amtrak station and opened in 2017.
City of Syracuse City of Syracuse Comprehensive Plan 2025, January 2005. City of Syracuse Comprehensive Plan 2040 (Adopted March 17, 2014)	The Plan <i>acknowledges the need for improving rail service in the Central New York Region.</i> The current train facility, the William F. Walsh Regional Transportation Center, will need to make track configuration modifications in order to accommodate the introduction of High Speed Rail. The Plan supports <i>transportation infrastructure that supports sustainable mass transit throughout Syracuse, the surrounding towns, and connects to High Speed Rail</i> , as well as concentrating development along transportation corridors.

Exhibit G-3—Consistency Summary of State and County Master Plans

Master Plans	Rail Transportation Objective
City of Buffalo The Queen City in the 21 st Century: the Buffalo Comprehensive Plan (Adopted February 7, 2006)	The Buffalo Plan <i>promotes the implementation of key transportation projects</i> in accordance with the 2030 Long Range Transportation Plan (LRTP). The LRTP <i>endorses the implementation of improvements to intercity transit service</i> for commuters and passengers between major cities and their connections. Local economic development officials have expressed interest in considering <i>relocation of the Buffalo-Depew Station closer to the downtown business district.</i>

1.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the land use impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.2). The full description of impacts associated with the Base Alternative and Alternatives 90A, 110, and 125 is presented in the following sections.

1.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that had already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies. Because proposed work with this alternative was located entirely within the right-of-way, no direct land use impacts were anticipated.

1.2.2 Alternative 90A

With Alternative 90A, Empire Service would provide increased frequency of service as well as improved travel times, with a program of 20 improvements in track, station, signalization, in addition to improvements proposed under the Base Alternative. It is anticipated that work could be contained within the right-of-way, and no direct land use impacts are anticipated.

1.2.3 Alternative 110

Alternative 110 would directly affect approximately 53 areas in eight counties – mostly along the Empire Corridor West and Niagara Branch.

Empire Corridor South

As with Alternatives 90A and 90B, land use impacts from Alternative 110 along the Empire Corridor South are not anticipated. Proposed work along this stretch is largely along the right-of-way.

Empire Corridor West

With Alternative 110, the proposed third track alignment from MP 164.5 to MP 165.4 in Schenectady County may impact a residential building and property and other undeveloped lands currently landlocked between the railroad and Barhydt Road and will also cross each end of Barhydt Road. Where the realigned third track would merge with the existing railroad at approximate MP 165.2, it would cross front yards and driveways of several residential properties at the intersection of Barhydt Road and Rector Road. The proposed third track and maintenance service road at the connection to the Selkirk Branch at MP 168.3 in Schenectady County may impact paved and unpaved parking/storage areas and the wooded edge of agricultural industrial property adjacent to Route 5.

In Montgomery County, the addition of a maintenance service road and additional passenger tracks or freight tracks may require realignments of Route 5 and other adjoining roadways. Realignments of Route 5 for the maintenance service road and proposed third track may impact residential properties at MP 172.6 and on Chapman Drive north of Route 5 (MP 173.6). Construction of the maintenance service road, third track, and an additional fourth track may require realignment of Route 5/Route 67 less than a mile east of the Amsterdam Station, impacting several businesses and residences. At MP 178.5, realignment of Route 5 may affect several residential, commercial, and other properties adjoining Route 5, including Old Fort Johnson, a historic site, and a fire station. At MP 179.8, realignment of Route 5 could affect the wooded edges of a private country club property, and will also affect frontages north of the highway including residences at the following locations: MPs 185, 187.3, 189, 196.4, and 196.9. The construction of the third and fourth tracks and a maintenance service road from approximate MP 181.5 to MP 182.3 in Montgomery County may impact undeveloped forested land at the edge of agricultural fields. Realignment of County Highway 26/Mohawk Drive to accommodate the service road and two additional passenger tracks may affect silos and the edges of properties near MP 183.2.

At MP 184.5, the maintenance access road and relocated freight track would affect a building adjoining the tracks, south of Route 5. Beginning within the village of Fonda (Town of Mohawk), from MP 185.9 and continuing west for three blocks to beyond the village boundaries to MP 187.8, this work outside the right-of-way may impact a number of closely spaced buildings/properties. Affected properties include several community facilities and businesses (gas station and other automotive services, restaurants, and stores), and residential properties in addition to roadway impacts. At the western end of the village, at approximate MP 186.7, the maintenance service road may impact Route 5 where it curves close to the railroad. The maintenance access road and relocated freight track may impact adjoining property for an automotive services facility just west of this, at MP 186.8.

To the west, in Montgomery County, the proposed work areas north of the track that might extend outside of the right-of-way would largely impact undeveloped or agricultural lands landlocked between the railroad and Route 5. At MP 191.7, one or more buildings may be impacted by the maintenance service road. From MP 192.5 to MP 192.8, the proposed third track and the service access road extends into the wooded portion of a residential property and may affect Route 5 at the curve where the land narrows at the Mohawk River. The relocation of Route 5 may indirectly impact farmland at this and other areas of Montgomery and Herkimer Counties although in most locations, no buildings impacts are anticipated. However, at MP 196.7, the relocation of Route 5 may impact farmland property and buildings on the opposite side of the roadway. The construction of the service access road and the proposed third track extends beyond the right-of-way at approximate MP 197.7, near a commercial/garage building in the village of Palatine Bridge (across Bridge Street from the Palatine Bridge Village Offices), and MP 198, which may affect a structure on the back of a property. The construction of the third track and a maintenance service road from MP 198.2 to MP 198.6 may

impact wooded property closely adjoining buildings on the same access drive as the historic Frey House. South of the village of Nelliston in the Town of Palatine, where the railroad closely adjoins the Mohawk River, the service access road and the proposed third track may impact an industrial structure at MP 200.6. Between MPs 205.4 to 206 in Montgomery County (Town of St. Johnsville), track realignment of the new/relocated freight tracks and the third track veers off the existing corridor and may impact primarily wooded lands bordering agricultural fields.

In Herkimer County, the third track and maintenance service road may impact wooded lands bordering agricultural fields between MPs 210 to 213. A farm structure at MP 210.8 that is closely bracketed by the railroad and Route 5 to the north may be impacted. West of MP 215 to the county line at approximate MP 235, there are many areas where the maintenance service road and, in some locations, the proposed third track may extend outside of the right-of-way. Between MPs 226.4 and 227, the construction access road and third and fourth tracks may impact the back side of several properties that front on Route 5, including residences and several industrial or commercial uses. At MP 228, a retail building closely bracketed by the railroad and Route 5 may be affected by the service road. Several residences may also be displaced at MP 230.9, and a realignment of Route 5 between MPs 230.4 and 230.8 may affect several residential frontages.

Just east of Utica Station in Oneida County, the proposed third track may impact a building at approximate MP 237.3. In Monroe County, the proposed third track and service access road may impact several buildings where construction extends beyond the right-of-way. These potential building impacts are at approximate MPs 360.6 and 361.2. In Genesee County, the proposed third track may impact a building at approximate MP 402.4. The existing Amtrak Buffalo-Depew Station will also be impacted with the construction of the new third track.

1.2.4 Alternative 125

Alternative 125 will involve the construction of exclusive new right-of-way along Empire Corridor West and would involve the greatest land use impacts of the alternatives considered.

Empire Corridor South

Roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. That stands as the only major difference between Alternative 125 and the other Alternatives (Baseline, 90A, 90B, and 110). Besides that small portion of undeveloped and partially-cleared land, program engineers anticipate no land use impacts from Alternative 125 along the vast majority of the Empire Corridor South.

Empire Corridor West/Niagara Branch

Alternative 125 would involve construction of a total of 236 miles of track on new alignment from roughly Rensselaer to Buffalo. Alternative 125 would include new right-of-way in most areas, but would merge back with the Empire Corridor over two 15- and 16-mile segments centered on Syracuse and Rochester, respectively. Alternative 125 would require acquisition of two to three thousand acres of land for creation of a sealed corridor between Albany and Buffalo. The following section addresses the potential impacts associated with the potential corridor identified during the Tier 1 assessment.

This route covers 126 miles on new alignment between Rensselaer County and a point 8.5 miles east

of Syracuse Station. Alternative 125 extends through urban areas in Albany and Schenectady Counties over a distance of 20 miles, following the New York State Thruway (I-87/I-90) over most of this distance. In Albany County, Alternative 125 crosses through industrial land, then follows the New York State Thruway at the outskirts of the City of Albany.

Passing west into Schenectady County, Alternative 125 continues to follow the New York State Thruway through more urbanized areas in Rotterdam, crossing through several residential neighborhoods where it deviates from the Thruway. The remainder of Alternative 125 extends through primarily undeveloped or very sparsely developed areas that consist primarily of forested and agricultural lands. Impacts are possible to properties (primarily residential) fronting on the highway where Alternative 125 parallels U.S. Route 20 to the south.

In the east end of Schoharie County, where Alternative 125 passes through more developed areas in the village of Esperance, it may involve displacements primarily of residences where it extends south of Route 20. Where Alternative 125 crosses U.S. Route 20 and Route 30A/162 in the Hamlet of Sloansville, it may displace residences or businesses along these highways. The remainder of Alternative 125 in Schoharie County crosses through primarily undeveloped and sparsely developed land that consist primarily of agricultural and forestland.

In Montgomery County, Alternative 125 crosses through predominantly forested and agricultural land. Although there may be displacements where Alternative 125 crosses roads, property displacements would be minimized by the sparsely developed nature of the county. Alternative 125 crosses through a country club.

In Herkimer County, Alternative 125 crosses through predominantly forested and agricultural lands. Alternative 125 would also have the potential for displacements where it crosses roadways, on which development is generally more closely clustered than for Montgomery County along sections of highways, such as Route 168 and Route 28, and County Road 125. In particular, Alternative 125 passes through more urbanized areas within the Town of German Flatts, south of the village of Herkimer, between Routes 51 and County Road 14. This section would involve crossing three residential streets, and crossing a public golf course minimizes displacements in this area. The remainder of the county along Alternative 125 is sparsely developed.

In Oneida County, Alternative 125 crosses through predominantly agricultural lands or undeveloped or forested lands. Alternative 125 extends through the southern outskirts of the Town of New Hartford, a suburb of the City of the Utica to the north, and passes north of the Village of Clinton. Alternative 125 crosses through two golf courses on either side of Route 5. To the west, it extends through Oneida Indian Nation-owned lands, including the northernmost portion of the Atunyote Golf Course and several other agricultural/undeveloped lands. Alternative 125 extends south of the Oneida Nation facilities along the New York State Thruway that include the Turning Stone Resort and Casino. Alternative 125 continues west through predominantly rural agricultural lands, passing between the villages of Oneida Castle and Sherrill where it crosses Route 5 at the west end of the county.

Through the eastern half of Madison County, Alternative 125 parallels Route 5 to the south, but is far enough south to avoid many of the properties fronting on the highway. Alternative 125 extends through the outskirts of the City of Oneida, on the east end of Madison County, and south of the village of Canastota in the middle of the county. In Madison County, Alternative 125 crosses through predominantly rural agricultural and forestland. Where it crosses roadways, there is the potential for displacements of residential and commercial properties.

In Onondaga County, Alternative 125 would merge with the existing Empire Corridor. Where it extends 16 miles through urban areas in and surrounding the City of Syracuse, it follows the existing railroad. Depending on the design of the elevated railroad structure over the existing railroad, there may be right-of-way impacts. Outside of the Syracuse urban area, Alternative 125 diverges from the existing Empire Corridor and continues on a new alignment 61 miles west to a point 11 miles east of Rochester Station. Alternative 125 extends through predominantly rural agricultural lands in Onondaga County outside of the Syracuse urban area, but may involve displacements where it crosses roadways. In Cayuga and Wayne Counties, Alternative 125 extends north of the existing railroad through predominantly rural agricultural or forested lands, but where it crosses roadways, it may displace properties. In Wayne County, Alternative 125 would impact a private campground at MP QH322. To the west, this alternative would also pass through a trailer park at MP QH341 and may also impact businesses along this section of Route 31F.

In Monroe County, Alternative 125 extends parallel to Route 31F, through residential neighborhoods that become more dense approaching the City of Rochester. Alternative 125 merges with the existing Empire Corridor along 16 miles in and surrounding the City of Rochester. Right-of-way impacts are possible depending on the design of the elevated railroad structure over the existing railroad. Alternative 125 diverges from the existing Empire Corridor again 5.5 miles west of Rochester Station to continue on new alignment 52 miles west to Buffalo. West of where Alternative 125 diverges from Empire Corridor, outside of the City of Rochester, it extends north of a commercial/industrial area, where it may displace one building. To the west, Alternative 125 extends through rural agricultural or forested areas through the remainder of Monroe County and in Genesee County, where it may displace properties where it crosses roadways. Alternative 125 would displace a portion of a large commercial farm operation on County Road 9 (Albion Road) and would extend through portions of a sand and gravel operation on County Road 26 (Ledge Road).

In Erie County, Alternative 125 would continue through rural agricultural lands, but also extends through more densely developed area, including a mobile home park, and business/industrial areas. This alternative may affect one or more industrial buildings/properties, before merging with Empire Corridor on the outskirts of Buffalo. The elevated structure over the existing railroad extending to the Buffalo Exchange Street Station may have involved right-of-way impacts.

2. Population

2.1 Existing Conditions

2.1.1 Empire Corridor South

The counties of New York, Bronx, Westchester, Rockland, Putnam, Orange, Dutchess, Ulster, Columbia, Greene, and Rensselaer, comprise the more urbanized and populous segment of the Empire Corridor. These counties had a 2010 population of 5,456,031 persons, comprising almost 2/3 of the study area population. From 2010 to 2019, these counties grew by 104,591 persons or 1.9% to 5,560,622. The total population in these counties is projected to grow by 674,731 persons or 12.1 percent by the year 2035. Exhibit 4-4 in Chapter 4 of the Tier 1 Final EIS compares the 2010, 2019, and 2035 populations by county for the entire Empire Corridor, and Exhibit 4-5 compares the population of the major cities over time (2006, 2010, and 2019).

New York City is the most populous city in the state and nation. The city's population increased

by 161,684 (2.0%) from 8,175,133 persons in 2010 to 8,336,817 persons in 2019. **Manhattan (New York County)**, one of five boroughs of New York City (that are also coterminous with counties), is the most densely populated county in the country. Three of the five New York City boroughs (Brooklyn, Queens, and Staten Island) are outside the study area. The two study area counties of New York (Manhattan) and the Bronx had a combined 2010 population of 2,970,981 persons or 33.2 percent of the study area. In 2019, these two counties grew by 75,932 persons (2.6%) to 3,046,913 persons or 33.8 percent of the study area. These two counties (or boroughs) are projected to grow by 264,691 persons, or 8.7 percent, by the year 2035. Manhattan is forecasted to grow by 71,972 persons (or 4.4%) by 2035, and **Bronx County** is projected to grow by 192,719 persons, an increase of 13.6 percent.

Within the Hudson Valley north of New York City are the counties of Westchester, Rockland, Putnam, Orange, Dutchess, Ulster, Columbia, and Greene, situated along the east and west banks of the Hudson River. The resident population within these Hudson Valley counties totaled 2,325,621 persons in 2010 or approximately 26.0 percent of the study area. In 2019, the resident population within these Hudson Valley counties grew by 29,374 (1.3%) to 2,354,995 persons.

Population is densest in the more urbanized areas closest to New York City. **Westchester County** accounted for 949,113 persons, or 10.6 percent, in 2010 of the study area population. In 2019, Westchester County grew by 18,393 (1.9%) to 967,506 persons. The largest city in this region is Yonkers in southern Westchester County, bordering Bronx County, with a 2010 population of 195,976 persons. The population increased by 4,394 (2.2%) by 2019 to 200,370 persons. In 2010, **Rockland County** accounted for 311,687 persons, or 3.5 percent of the study area population, and **Orange County** had 372,813 residents in 2010, or 4.2 percent of the study area total. In 2019, Rockland County grew by 14,102 persons (4.5%) to 325,789 residents, and Orange County grew by 12,127 (3.3%) to 384,940 residents.

In 2010, the remaining four counties to the north in this portion of the Hudson Valley each represented between 0.6 percent (Greene County, with 49,221 residents) to 3.3 percent (Dutchess County with 297,488 persons) of the study area population. Between 2010 and 2019, these counties lost between 2,033 persons (-4.1%) to 4,920 persons (2.7%). Poughkeepsie, located in Dutchess County, is the second largest city in this region with a 2010 population of approximately 31,045 persons and lost population (530 persons or 1.7%) by 2019, with a population of approximately 30,515 persons.

These eight counties in the Hudson Valley region are forecasted to experience the largest population growth rates outside of New York City, reflecting their attractiveness as bedroom communities within the New York City and Capital District commutersheds. The population of these eight counties is projected to increase by 675,062 persons or 11 percent by the year 2035, with the highest growth rates in the areas outlying New York City. The largest increase is expected in Orange County, which is forecasted to increase by 127,518 persons or 33.1 percent by 2035. Westchester County is projected to increase by 85,309 persons in 2035, an increase of 8.8 percent. The largest percentage increase is forecasted for Putnam County, with an increase of 44.1 percent, or 43,326 persons. Rockland County is expected to experience an increase of 34,168 persons, or 10.5 percent, by 2035.

Population growth rates by 2035 generally decrease with increasing distance from the city. Growth projected by 2035 in **Dutchess County** is 22 percent (or 64,746 persons) and is 23.2 percent (or 41,202 persons) in **Ulster County**. To the north, the populations of more rural areas within **Columbia and Greene Counties** are forecasted to grow by 13.9 percent (8,263 persons) and 12.4 percent (5,839 persons), respectively, by 2035.

To the north, **Rensselaer County** is part of the Capital District Region. In 2010, the population of Rensselaer County totaled 159,429 persons or approximately 1.8 percent of the study area population. In 2019, the population of Rensselaer County totaled 158,714 persons and is forecasted to experience a drop in population of 331 persons (or -0.2%) by the year 2035. This forecasted drop in population reflects historic job losses in the region that have occurred dating back to 1960, with the decline of the manufacturing and industrial base.

2.1.2 Empire Corridor West/Niagara Branch

The population in the fourteen counties (Albany, Schenectady, Schoharie, Montgomery, Herkimer, Oneida, Madison, Onondaga, Cayuga, Wayne, Monroe, Genesee, Erie and Niagara) along Empire Corridor West/Niagara Branch totaled 3,495,494 persons in 2010 and declined by 39,483 persons to 3,456,011 in 2019. In contrast to the counties to the south, this region is forecasted to experience a loss in population, totaling 22,949 persons (or -0.7%) by 2035. This decline follows historic population losses precipitated by the decline of the region's core manufacturing and industrial base. Schoharie County is projected to experience the largest future percentage increases in population in 2035, with a projected growth of 12.2 percent (3,794 persons).

Albany and Schenectady Counties are part of the Capital District, along with Rensselaer County, and Saratoga County (outside the study area). Albany and Schenectady Counties comprised 5.1 percent of the study area population, totaling 458,931 persons in 2010 and 460,805 persons in 2019. These counties are projected to lose approximately 5.0 percent of their total population by 2035 (22,950 persons).

Schoharie County, along Alternative 125, had a total population of 32,749 persons in 2010 that decreased by 1,750 persons by 2019, comprising only 0.34 percent of the study area population. Schoharie County is projected to increase in population by 3,794 persons to 34,793 in 2035, an increase of 12.2 percent.

To the west, the counties of Montgomery and Herkimer are predominantly rural. The combined population of these two counties, 114,738 persons in 2010, declined by 4,198 in 2019 to total 1.2 percent of the study area population. These two counties are forecasted to experience a population loss of 2,219 persons by 2035. The population of **Montgomery County** is expected to decline by 5.8 percent, and **Herkimer County** is projected to decrease by 1.0 percent.

Oneida County's population decreased by 6,207 persons from 2010 to 228,671 in 2019. Oneida County is forecasted to lose 2.6 percent of its population by 2035. Utica is the largest city in the county, with a 2010 population of 62,235, which declined to a population of 59,750 in 2019.

Madison County, along with Onondaga and Cayuga Counties, is part of the Central Region of New York. Madison County, which is predominantly rural, comprised 0.8 percent of the 2010 study area population and declined by 2,501 persons to a total population of 70,941 in 2019. Madison County is projected to gain 2.5 percent in population by 2035.

Onondaga County, along with Cayuga, Wayne, and Monroe Counties, is part of the Finger Lakes District, a key tourism region in the state. Onondaga County comprised 5.2 percent of the study area population in 2010 and declined in population by 6,498 persons to total 460,528 in 2019. Onondaga County is projected to lose 2.2 percent of its population by 2035. The largest city in the county is

Syracuse, with a population that fell from 145,170 persons in 2010 to 142,327 persons in 2019.

Cayuga and Wayne Counties, predominantly rural agricultural in nature, together comprised 1.9 percent of the study area population in 2010. The population of these counties fell by 7,304 persons to total 166,494 in 2019. This area is forecasted to gain 7.7 percent in population by 2035.

Monroe County is one of the more populous counties, totaling 744,344 persons in 2010, or 8.3 percent of the study area population. In 2019, the population of Monroe County decreased by 2,574 persons (or by 0.4%) to 741,770. The county is expected to lose 0.1 percent of its population by 2035. The largest city in the county, Rochester, decreased in population from 210,565 in 2010 to 205,695 in 2019.

Genesee County is predominantly rural and comprised only 0.7 percent of the study area population in 2010. The population of this county fell by 2,799 persons to total 57,280 persons in 2019. This county is projected to gain 0.4 percent of its population by 2035.

At the western end of the study area, Erie and Niagara Counties together comprised 12.7 percent of the study area population in 2010 (a total of 1,135,509 persons). By 2019, Erie County lost 338 residents by, Niagara County lost 7,188 of its population over the same time period, for a combined population of 1,127,983 persons in 2019. The largest city in Erie County, Buffalo had a 2010 population of 261,310 and declined to 255,284 by 2019. These counties are expected to experience a population increase of 605 persons by 2035. **Erie County** is projected to decline by 0.7 percent to total 912,661 persons by 2035. **Niagara County**, which includes the last station stop at Niagara Falls, a major tourism destination, is expected to gain 3.2 percent to total 215,927 persons by 2035.

2.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.3). The impacts of the Base and the other Build Alternatives on the region's population are described in more detail below.

2.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporated improvements that had already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies.

With the Base Alternative, population will continue to grow at least as fast as projected in the study area counties. It is projected that the study corridor will realize a 7.2 percent gain in population from 2019 to 2035, or an increase of 651,782 persons. In the year 2035, population along the eleven Empire Corridor South counties is projected to increase by 674,731 persons or 12.1 percent, while the population within the fourteen counties along the Empire Corridor West/Niagara Branch study area is projected to decline by 22,949 persons or -0.7 percent.

Improvements to intercity passenger service that result in increases in ridership and improve mobility and travel choices may, in turn influence the attractiveness of the area for businesses and residents. This in turn could result in increases in population. With the Base Alternative, this effect, if discernible, will represent a minimal increase.

2.2.2 Alternative 90A

With additional track, Alternative 90A service frequencies and travel time improvements would result in increases in ridership. Improved mobility and travel choices could make the program area more attractive to businesses and residents. This may translate into increases in population along the corridor that would be greater than those experienced with the Base Alternative.

2.2.3 Alternative 110

With Alternative 110, improved frequency and travel times would provide increases in mobility and travel choices, making the program area potentially more attractive to businesses and residents. This could result in increases in population, which would be greater than for Alternative 90B, based on increased ridership (200,000 additional passengers (one-way) annually) and attractiveness of the area to residents and businesses, and this effect may be more pronounced in the vicinity of the station sites.

2.2.4 Alternative 125

This alternative would have the greatest potential to result in increases in population within the program area, and this effect may be more pronounced in the area of the station sites served. This alternative would result in the greatest improvements to service in areas west of Albany and would produce the largest ridership increases (1.7 million more passengers annually than the Preferred Alternative). Improving the frequency and travel times of intercity passenger rail service, particularly west of Albany, would increase mobility and travel choices for businesses and residents, making the program area potentially more attractive as a bedroom community.

3. Employment and Businesses

3.1 Existing Conditions

3.1.1 Employment

Section 4.3.3 provides a county by county description of employment and describes the major business districts. Exhibit 4-6 in Chapter 4 of the Tier 1 Final EIS compares the 2010, 2019, and 2035 employment and unemployment rates by county for the entire Empire Corridor. Employment in the twenty-five study area counties totaled 6,372,282 in 2010 and grew by 949,344 jobs (or 14.9%) by 2019.

Empire Corridor South

The eleven counties along Empire Corridor South accounted for the majority of study area employment and provided 4,307,858 jobs in 2010, increasing by 823,375 persons (19.1%) to 5,131,233 jobs in 2019. This labor market is projected to increase by 19.2 percent (825,889 jobs) from 2010 to 2035. Average unemployment rates decreased by roughly half in almost all study area counties.

Empire Corridor West/Niagara Branch

The fourteen counties along Empire Corridor West/Niagara Branch accounted for 2,064,424 jobs in 2010 and increased by 125,969 jobs (or 6.1%) to 2,190,393 jobs by 2019. This labor market is forecasted to expand by 15.4 percent by 2035, with a projected increase of 337,272 jobs.

3.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses the impacts of the Preferred Alternative, Alternative 90B, and presents a comparison to the other alternatives considered (refer to Section 4.3). The employment and business impacts of the Base Alternative and other Build Alternatives are described in more detail below.

3.2.1 Base Alternative

With the Base Alternative, consisting of eight previously completed improvements, weekday service frequencies will be maintained. The Base Alternative involved construction restricted to the right-of-way, and no direct business displacements were anticipated. With this alternative, employment and business activity will continue to grow as projected, with a total increase of 4.6 percent, or 339,786 jobs from 2010 to 2035. The eleven counties along Empire Corridor South, accounting for the majority (70%) of study area employment is projected to increase by 15.4 percent from 2019 to 2035, with an increase projected of 337,272 jobs. For the fourteen counties along Empire Corridor West/Niagara Branch, the labor market is forecasted to expand by 15.4 percent from 2019 to 2035, with a projected increase of 337,272 jobs by 2035.

3.2.2 Alternative 90A

Alternative 90A would involve construction confined to the existing right-of-way, and no direct business displacements would occur. The increased frequency of service and improved travel times with Alternative 90A would result in increases in ridership and could make the program area more attractive to both employers and employees. This would represent a positive effect for businesses, both from the perspective of potential clients and business and improving accessibility and convenience for workers.

Any corresponding improvements in freight traffic would benefit businesses that rely on freight for their operations. This may result in increases in employment and business activity that would be greater than the increases experienced under the Base Alternative, particularly in the area of the station sites.

3.2.3 Alternative 110

Alternative 110 would involve greater property impacts (with potential direct impacts on 53 areas in eight counties) than the Preferred Alternative, Alternative 90B, increasing the potential for direct impacts on businesses.

Alternative 110 would provide further improvements in travel times and ridership, which could potentially benefit both businesses, and provide more convenient access for prospective clients and employees. This could result in increases in employment and business activity that would be greater

than for Alternative 90B, particularly in the vicinity of station sites. Better segregation of passenger service and freight service between Schenectady and Buffalo, and corresponding improvements in freight movements, could benefit businesses that rely on freight traffic.

3.2.4 Alternative 125

Of the alternatives under consideration, Alternative 125 would involve the greatest potential for business displacements and direct impacts, since it would involve construction of 236 miles of a new sealed corridor requiring acquisition of two to three thousand acres of land. However, the conceptual location of the new corridor in primarily undeveloped rural lands between the major urban centers would minimize business displacements. The acreage of commercial land within the 125 Study Area is shown in Exhibit 4-3 of the Tier 1 Final EIS.

At the same time, this alternative may represent the largest overall regional benefit to businesses, employment, and business activity. This effect may be more pronounced in the stations that experience improved service with Alternative 125 (Albany-Rensselaer, Syracuse, Rochester, Buffalo [Buffalo-Depew and Buffalo Exchange Street], Niagara Falls Stations as well as stations along Empire Corridor South). Alternative 125 provides the fastest travel times of the alternatives under consideration, and provides more frequent service. Alternative 125 provides exclusive, express, grade-separated tracks between Albany-Rensselaer and Buffalo-Depew stations, which bypass several of the station sites along the existing Empire Corridor (Schenectady, Amsterdam, Rome, and Utica). This alternative will maintain existing service to Amtrak passenger stations currently served along the Empire Corridor, so no adverse impacts to these business districts from loss of business generated by patrons will occur.

4. Environmental Justice and Title VI

4.1 Existing Conditions

4.1.1 Overview

The environmental justice study area consists of 20 counties for the 90/110 Study Area and 21 counties for the 125 Study Area, as these study areas are defined in Section 4.1 of the Tier 1 Final EIS. Exhibit 4-7 in the Tier 1 Final EIS shows the minority, low-income, and disadvantaged populations (LEP persons, persons with disabilities, persons at least 65 years of age) for the study area. These statistics were compared to statewide averages and minority and low-income populations were also compared to federal (CEQ) and state (NYSDEC) environmental justice criteria. Federal guidance on EJ allows for agencies to defer to state or local definitions of EJ populations, provided they are at least as inclusive as federal definitions. Federal EJ criteria is also presented, but the NYSDEC criteria is more conservative than the federal criteria in rural areas (for minorities) and for low-income. Overall, the State of New York has a minority population of 47.5 percent according to updated data from the 2020 U.S. Decennial Census (up from 34.3 percent in 2010) and a low-income population of 13.8 percent. The NYSDEC criteria for environmental justice include a minority population equal to or greater than 51.1 percent in urban areas. This Environmental Justice assessment considered this to be the threshold for a potential environmental justice area for most of the study area counties except for seven rural counties (Columbia, Schoharie, Herkimer, Madison, Cayuga, Wayne, and Genesee Counties), where the threshold of 33.8 percent for minority populations applied. The NYSDEC criterion for a low-income population is 23.59 percent.

In general, the New York metropolitan area, and in particular, Bronx County had the highest statistics for minorities and low-income populations. However, although both Manhattan and the Bronx had populations greater than the statewide average, only the Bronx exceeded the NYSDEC criteria, with Westchester County just under the 51.1 percent criterion at 50.5 percent. Persons with Limited English Proficiency (LEP) make up 26.0 percent of the population in the Bronx, the highest percentage of any county along the Empire Corridor. LEP persons comprise 14.8 percent of the New York County population, slightly higher than for the entire State of New York (13.3%). At 22.5 percent, New York City has a higher proportion of LEP persons than any city along the Empire Corridor.

Generally, as the rail corridor moves north out of New York City and Bronx County, statistics for counties to the north are lower than statewide averages. Although the counties with metropolitan areas had generally higher minority populations, and low-income populations are generally higher west of Albany; only three other counties, Montgomery, Oneida, and Erie Counties, exceeded the statewide averages and only for low-income populations. The environmental justice statistics were generally higher in the cities than for the counties along the rail corridor, as shown in Exhibit 4-7. Section 4.4 reviews in more detail the environmental justice characteristics of the 90/110 Study Area along both Empire Corridor South and Empire Corridor West/Niagara Branch. The 125 Study Area along the Empire Corridor West/Niagara Branch is described below.

4.1.2 Empire Corridor West/Niagara Branch: 125 Study Area

Minority and low-income percentages are county-wide; therefore, the percentages for Albany, Schenectady, Montgomery, Herkimer, Oneida, Madison, Onondaga, Cayuga, Wayne, Monroe, Genesee, Erie, and Niagara counties remain the same as for the Empire Corridor West/Niagara Branch 90/110 Study Area. Although this alignment is generally either south or north of the existing Empire Corridor West/Niagara Branch Study Area over a combined distance of 240 miles, the two alignments do converge through the major urban centers of Syracuse, Rochester, and Buffalo, where they merge to continue to Niagara Falls.

West of Rensselaer County, the 125 Study Area branches off to extend south of the cities of Albany and Schenectady, following the New York State Thruway, then leaves the New York State Thruway to traverse through primarily rural land through Schenectady, Schoharie, Montgomery, Herkimer, Oneida, and Madison counties.

Schoharie County is the only county that falls within the 125 Study Area that the existing Empire Corridor West/Niagara Branch 90/110 Study Area does not traverse. Of all the study area counties, Schoharie has the second lowest minority population (10.3%). The low-income population remains similar to the western portion of the Empire Corridor study area at 12.1 percent, and the percentage of LEP persons is low, at 1.0 percent. The statistics for people with disabilities and persons at least 65 years of age are higher than for the state as a whole, at 16.5 percent and 21.0 percent, respectively.

Like the 90/110 Study Area, the 125 Study Area also passes through the cities of Albany, Schenectady, Syracuse, Rochester and Buffalo; however, the 125 Study Area does not pass through the city of Utica. Existing Amtrak passenger service to all existing station stops along the Empire Corridor West (including the stations bypassed by the 125 Study Area) will be maintained under the 125 mph alternative, so these populations' centers will continue to be serviced.

4.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the environmental justice impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered, including the Base Alternative (refer to Section 4.4). The impacts of the Base and other Build Alternatives on the region's population are described below.

4.2.1 Base Alternative

Since there were fewer improvements in the Base Alternative compared with the various Build Alternatives, there would also be fewer benefits in terms of increased service and reliability to the low-income and minority communities. The Tier 1 Draft EIS addressed the potential impacts of the eight projects comprising the Base Alternative on environmental justice/Title VI.

With the Base Alternative, disproportionately high and adverse impacts to minority or low-income communities remain unlikely. Of the counties in the Empire Corridor study area, only Bronx County exceeded NYSDEC environmental justice thresholds of greater than 51.1 percent of the population for minority communities and greater than 23.59 percent of the population for low-income communities. Currently, the Base Alternative does not include improvement projects within Bronx County; therefore, at the county level, it is unlikely that there will be disproportionate impacts to low-income and minority communities.

At the city level, one improvement project associated with the Base Alternative included Syracuse track improvements and signal upgrades within the eastern portion of the City of Syracuse (EW-6, MPs 278 to 291). The addition of an extra track and signal improvement work occurred primarily in the existing right-of-way, and it is unlikely that these improvements had a disproportionately high and adverse impact to the low-income community within the City of Syracuse. Additionally, upgrades to the Rochester Station (EW-19) in an area where NYSDEC environmental justice thresholds are exceeded will ultimately provide a benefit to these communities, and disproportionately high and adverse impacts to minority or low-income communities were unlikely through the station upgrade.

4.2.2 Alternative 90A

With Alternative 90A, upgrades to stations and increased trip frequency would ultimately provide a benefit to communities. Disproportionately high and adverse impacts to minority or low-income communities would be unlikely.

Second track improvements proposed for Bronx County under Alternative 90A would occur within the current right-of-way and would be unlikely to have a disproportionately high and adverse impact to minority and low-income communities in this area. Increased frequency of service could have the potential to incur additional noise impacts from train passbys, however the additional trips represent a minimal increase over current rail traffic that includes Metro-North commuter rail traffic. Alternative 90A would also involve work within the right-of-way, with no significant change in the visual appearance of railroad facilities and therefore would involve minimal visual impact. Construction of the program could involve noise and air quality impacts, but these would be temporary in nature.

Proposed signal upgrades, station improvements and areas of extra track proposed along the corridor for Alternative 90A would occur within the major urban areas of Poughkeepsie, Albany,

Syracuse and Rochester. Minority and/or low-income populations that exceed the NYSDEC criterion are located in these improvement areas; however, Alternative 90A improvements (including signal upgrades and extra track) are anticipated to be contained within the existing right-of-way. Therefore, property impacts would not occur, and disproportionately high and adverse impacts to minority or low-income communities would be unlikely. Noise impacts from train operations are also not anticipated as the increase from the Base Alternative is projected to be less than 3 dBA (considered imperceptible) at receptors at a distance of 50 feet from the centerline. Air quality impacts to EJ populations are also not anticipated. Station improvements at the Syracuse and Buffalo-Depew stations also are anticipated to be contained within the right-of-way, but would involve larger construction impacts (e.g., temporary noise increases).

4.2.3 Alternative 110

The Alternative 110 would incur overall economic and transportation benefits from improved travel times. The addition of third and fourth tracks and maintenance service roads will involve right-of-way impacts in more locations than for Alternative 90B. However, it is unlikely that there would be disproportionately high and adverse impacts to minority or low-income communities, since the majority of these displacements would occur in rural or relatively low-density population areas where environmental justice communities have not been identified. However, in the cities of Utica, Syracuse, Rochester, and Buffalo, there are limited residential takings anticipated, and minimal impacts are anticipated to environmental justice communities. Utica, Syracuse, Rochester, and Buffalo have minority and low-income communities that exceed the NYSDEC criterion; however, third and fourth tracks would generally be added within the existing right-of-way in these cities. Noise impacts from train operations are also not anticipated as the increase from the Base Alternative is projected to be less than 3 dBA (considered imperceptible) at receptors at a distance of 50 feet from the centerline. Air quality impacts to EJ populations are also not anticipated. Alternative 110 would involve greater visual impacts than Alternative 90B, but since the work would be largely located within the existing right-of-way, Alternative 110 would not involve substantial visual impacts to surrounding EJ communities.

4.2.4 Alternative 125

For Alternative 125, increased trip frequency and reduced travel times would ultimately provide a benefit to communities. Disproportionately high and adverse impacts to minority or low-income communities would be unlikely.

The majority of Alternative 125 would be on new alignment along the Empire Corridor West, passing through rural and agricultural land, which would have low potential for impacts on environmental justice populations. There are planned third and fourth track improvements on elevated structure that would occur in more urban locations including the cities of Syracuse, Rochester and Buffalo. Rochester, Syracuse and Buffalo have minority and low-income communities that exceed the NYSDEC criterion; however, third and fourth tracks would generally be added within the existing right-of-way in these cities. Noise impacts from train operations along Empire Corridor are also not anticipated as the increase from the Base Alternative is projected to be less than 3 dBA (considered imperceptible) at receptors at a distance of 50 feet from the centerline. Air quality impacts to EJ populations are also not anticipated. The elevated tracks could have visual impacts in the counties of Rensselaer and Albany where it extends along the New York State Thruway and the communities of Syracuse, Rochester, and Buffalo, and there is a potential for right-of-way impacts where the tracks are elevated in these urban areas. Alternative 125 would involve the greatest potential for noise

impacts for a new two-track corridor dedicated to high-speed passenger service approximately 280 miles from Albany/Rensselaer station to Buffalo Exchange Street station. If this alternative had been advanced for further consideration, a more detailed assessment would have been performed in Tier 2 using census block level information to identify potential environmental justice populations and refine the design/relocate the alignment to avoid or minimize potential impacts.

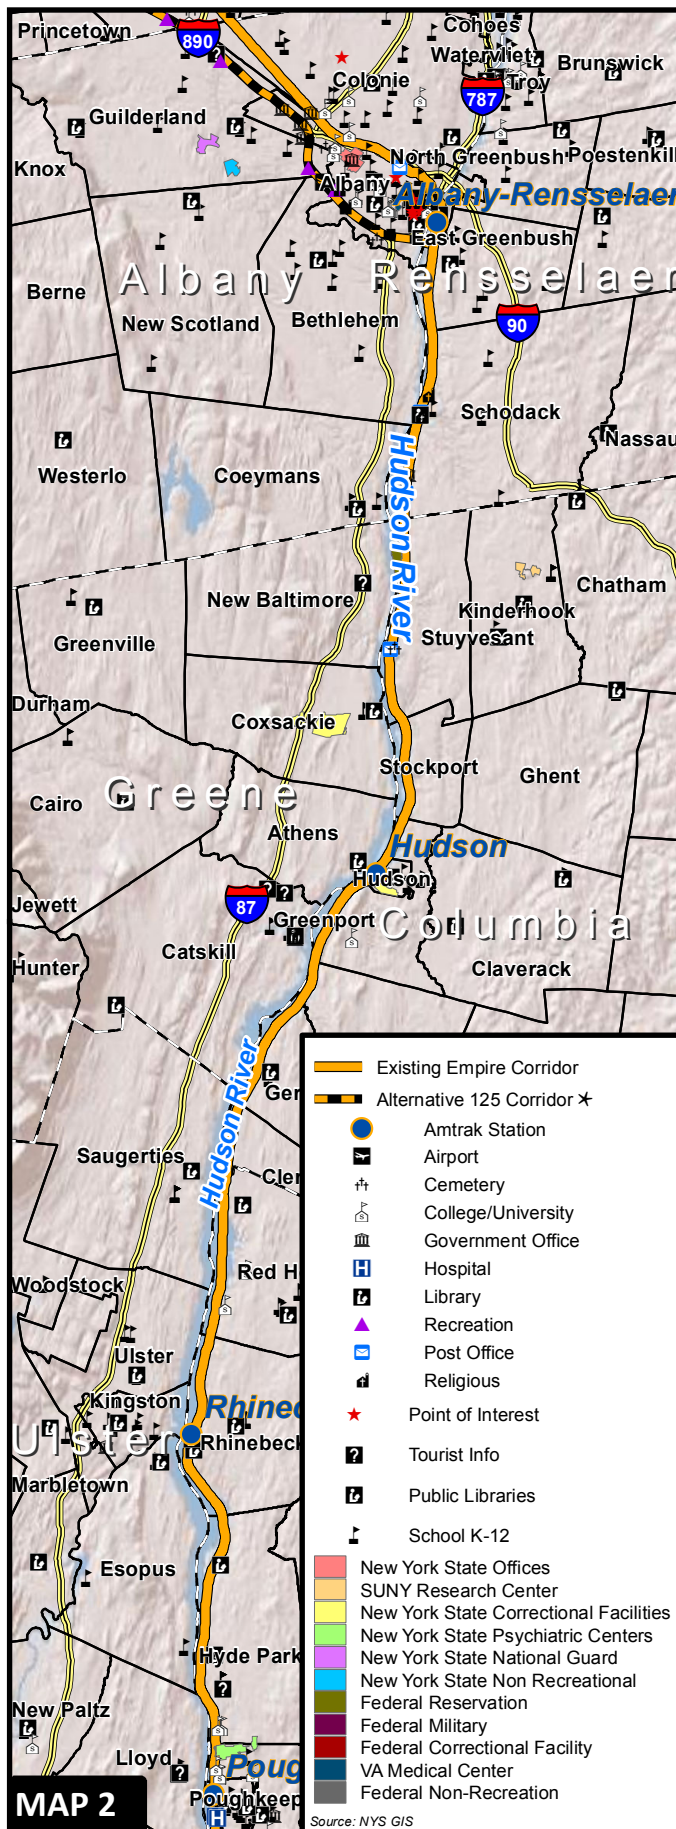

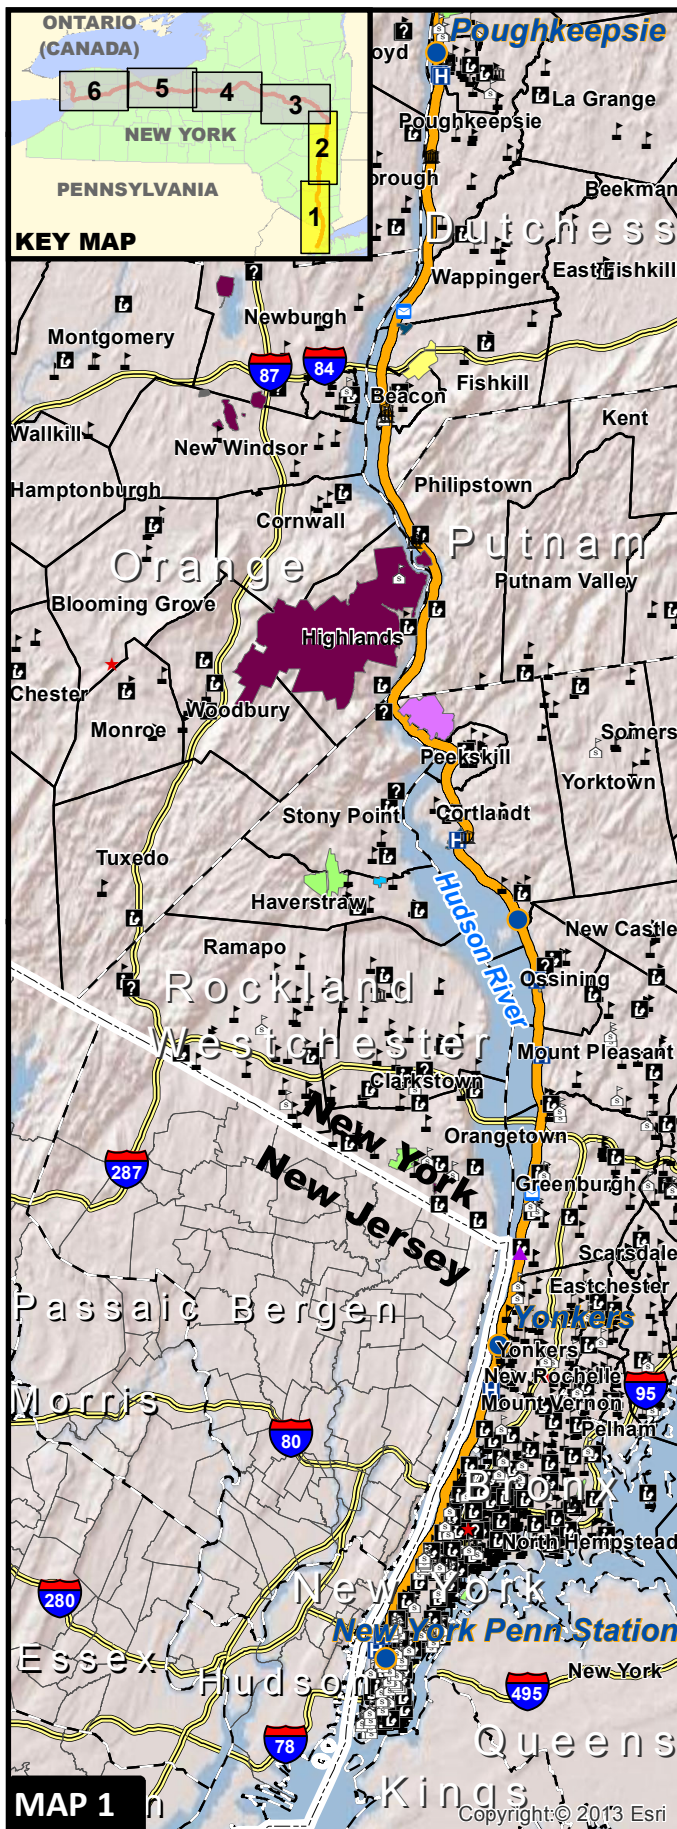

The exclusive two-track high-speed corridor for Alternative 125 would bypass the cities of Albany and Utica, which have low-income populations that exceed the NYSDEC criterion, although existing Empire Amtrak service would be maintained to stations in these cities. Existing Amtrak passenger service to all existing station stops along the Empire Corridor West/Niagara Branch (including the stations bypassed by Alternative 125) would be maintained under Alternative 125, so these population centers would continue to receive service. However, diversion of express travelers from these stops may have an adverse effect on the economies of these cities with EJ populations.

5. Community Facilities

5.1 Existing Conditions

As illustrated in Exhibit G-4, Community Facilities Maps (3 of 3) within the 90/110 Study Area, there were a total of:

- Twelve colleges or institutes and thirty-three K-12 schools;
- Eight fire stations and four police stations (including a police station for the Oneida Indian Nation);
- Sixteen medical facilities, including hospitals, medical offices, and emergency ambulance services;
- Twenty-two post offices;
- Nineteen libraries;
- Twenty-two places of worship;
- Twenty-three government offices, including a foreign consulate, courthouses, federal, state, county, and municipal government offices;
- Four military installations, including Camp Smith New York State Military Reservation, U.S. Military Academy at West Point, a U.S. Naval Recruiting office in Schenectady, and Niagara Falls Air Force Reserve Base;
- Twenty-five cultural sites, including museums, arenas, auditoriums, and tourist information centers;
- Nine facilities that are either Department of Public Works maintenance facilities, sewer facilities, or solid waste/landfill/recycling facilities;
- Five correctional facilities;
- Three airports; and

*Alt. 125 as shown is a potential corridor used to analyze the potential operating characteristics, environmental impacts and cost for this speed (125 mph) threshold.

Tier 1 EIS
High Speed Rail
Empire Corridor Program

- Seventeen cemeteries.

Within the 125 Study Area, there were a total of:

- Nine colleges or institutes and thirty-three K-12 schools;
- Three fire stations and two police stations;
- Thirteen medical facilities, including hospitals, medical offices, and emergency ambulance services;
- Twelve post offices;
- Ten libraries;
- Eleven places of worship;
- Thirteen government offices, including a foreign consulate, courthouses, federal, state, county, and municipal government offices;
- Four military installations, including Camp Smith New York State Military Reservation, U.S. Military Academy at West Point, New York Army National Guard Heliport in Albany, and Niagara Falls Air Force Reserve Base;
- Twenty-eight cultural sites, including museums, arenas, auditoriums, and tourist information centers;
- Five facilities that are either Department of Public Works maintenance facilities, sewer facilities, or solid waste/landfill/recycling facilities;
- One correctional facility;
- Four airports; and
- Thirteen cemeteries.

5.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.5). The potential effects impacts of the Base Alternative and other Build Alternatives are described in more detail below.

5.2.1 Base Alternative

The Base (No Action) Alternative represents the baseline condition against which the alternatives will be measured and incorporates improvements that had already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies.

Because proposed work with this alternative was anticipated to be located entirely within the right-of-way, no land acquisitions were anticipated, and therefore no impacts to community facilities were anticipated.

5.2.2 Alternative 90A

The work with Alternative 90A will largely lie within the existing right-of-way; therefore, no impact to community facilities are anticipated. Alternative 90A involves increased frequency of service as well as improved travel times, with a program of 20 improvements in track, station, signalization.

5.2.3 Alternative 110

Empire Corridor South

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, is proposed, and impacts to community and public facilities impacts are not anticipated to occur.

Empire Corridor West/Niagara Branch

With Alternative 110, trackwork would start at MP 159 and would extend west from here. At MP 160, the proposed siding and crossover would be adjacent to a state agency office and the Empire State College of the State University of New York, but would not extend outside of the right-of-way at this location. Track realignments outside of the right-of-way would be required near MP 165 in Schenectady County. However, the proposed realignment will not directly impact community facilities at this location.

At MP 168, Vedder Cemetery is mapped just north of the railroad. Although Alternative 110 extends outside of the right-of-way to the west of this point to connect to the Selkirk Branch, the proposed third track and maintenance service road is within the right-of-way immediately adjacent to the cemetery.

At MP 178.5 in Montgomery County, the realignment of Route 5 may be necessary to accommodate the third and fourth tracks and maintenance service road on the north side of the existing railroad. This realignment of the roadway may affect several properties fronting on Route 5 and adjoining streets (Mergner Road and Fort Johnson Avenue), including Old Fort Johnson, a historic site, and the Fort Johnson Fire Station. West of MP 186 in the village of Fonda, there is a post office building and the Fonda Municipal Building/Fire House that may be impacted by the construction of the new/relocated freight track and the maintenance service road.

In Onondaga County, the 110 Alternative passes close to a cemetery between MPs 289.8 and 290; however, impacts to the cemetery are not anticipated as all work within this area is contained within the rail right-of-way. New passenger tracks will be added south of the tracks in the areas adjoining Alliance Stadium, a minor league baseball stadium in Syracuse, but will not directly affect the facility as the work will be contained within the right-of-way.

In Monroe County, Alternative 110 passes close to the Rochester Medical Museum and Archives complex within the City of Rochester at MP 368.2, but no impacts to this facility are anticipated as all work is contained within the railway right-of-way. At approximate MP 371.8, Alternative 110 passes very close to the Frontier Field minor league baseball stadium, but no impacts are anticipated since all work is contained within the right-of-way at this facility as well.

In Genesee County, Alternative 110 passes close to the Christian Missionary Academy between MPs 400.5 and 401.5. In Erie County, Alternative 110 passes by three correctional institutions between

MPs 422 and 423. At MP 425, the alternative passes close to the Buffalo-Lancaster Airport. Although these facilities are in close proximity to the railroad, no direct impacts to these facilities are anticipated.

5.2.4 Alternative 125

Empire Corridor South

Roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. The impacts to community facilities within this one mile stretch of the corridor are not anticipated.

Empire Corridor West/Niagara Branch

Alternative 125 would involve construction of a total of 236 miles of track on new alignment along three different segments: Rensselaer to Syracuse, Syracuse to Rochester, and Rochester to Buffalo. Alternative 125 also would include new right-of-way in most areas, but would merge back with the Empire Corridor over two 15- and 16-mile segments centered on Syracuse and Rochester, respectively.

This route covers 126 miles on new alignment between Rensselaer County and a point 8.5 miles east of Syracuse Station. Alternative 125 extends through urban areas in Albany and Schenectady Counties over a distance of 20 miles, following the New York State Thruway (I-87/I-90) over most of this distance. For the majority of this stretch of dedicated passenger rail corridor, no impacts to community facilities are anticipated as the proposed rail is located within the NYS Thruway right-of-way. However, there are several impacts to community facilities anticipated in this section as noted below.

In Schenectady County, Whispering Pines Golf Course at MP QH158 may be impacted by Alternative 125. Just before MP QH161, Alternative 125 passes through Holy Cross Cemetery and just south of St. Cyril Cemetery.

In Montgomery County, Alternative 125 passes through, and would impact, the Canajoharie Country Club at MP QH194. At MP QH198, it passes close to Hickory Acres Airport, but no impacts to this facility are anticipated.

In Herkimer County, Alternative 125 crosses Doty's Golf Course just west of MP QH218 between Forge Hill Drive (MP QH218.2) and County Road 14 (MP QH218.7) in the Town of German Flatts.

Just after crossing the Seneca Turnpike in Oneida County, Alternative 125 crosses through the northern corner of the Skenandoa Golf Club between MPs QH237.6 and QH237 and extends through the southwest corner of Westmoreland Golf Course between MPs QH238.7 and QH238.9 in the Town of Westmoreland.

In Madison County, Alternative 125 extends within close proximity to water supply facilities for the City of Oneida. Alternative 125 passes through Lenox Rural Cemetery just west of MP QH256, which would be impacted by this alternative. At approximate MP QH262.5, this alternative passes through a ballfield at the Bolivar Road School within the Town of Sullivan.

In Onondaga County, the alignment merges with the existing Empire Corridor. Just before the merge, between MPs QH267 and QH268, Alternative 125 may impact the Old Oak Golf Club within the Town of Manlius as the rail passes just north of the golf course. Alternative 125 extends through 16 miles of urban area surrounding the City of Syracuse. Depending on the design of the elevated railroad structure over the existing railroad, there may be right-of-way impacts, the extent of which would be determined in Tier 2. Just before Alternative 125 diverges from the existing Empire Corridor again, the rail passes near Most Holy Rosary Cemetery, but since this is on the existing Empire Corridor and within the existing right-of-way, no impacts to the cemetery are anticipated.

At MP QH284, Alternative 125 diverges from the existing Empire Corridor and continues on a new alignment 61 miles west to a point 11 miles east of Rochester Station in Monroe County. Alternative 125 passes directly through and would impact Camillus Airport between MPs QH284.5 and QH285 in Onondaga County. Alternative 125 passes directly north of the tourist information center and rest stop on the New York State Thruway (I-90), but no impacts to this facility are anticipated.

In Monroe County, near the border with Wayne County at MP QH343, Alternative 125 would pass through the southwest corner of Perinton Golf and Country Club at Macedon Center Road and may impact this facility. Alternative 125 merges with the existing Empire Corridor at MP QH346, continuing on the existing corridor through areas outside of Rochester and through the downtown area. Depending on the design of the elevated railroad structure over the existing railroad, there may be right-of-way impacts, the extent of which would be determined in Tier 2. Alternative 125 diverges again at MP QH361, 5.5 miles west of Rochester Station, to continue on new alignment 52 miles west to Buffalo in Erie County.

In Erie County, Alternative 125 passes through Clarence Fillmore Cemetery just beyond MP QH408. Just past MP QH413, as the new rail corridor rejoins the Empire Corridor, Alternative 125 passes the Walden Golf Driving Range to the north, but no impacts to this facility are anticipated. Depending on the design of the elevated railroad structure over the existing railroad extending to the Buffalo Exchange Street Station, there may be right-of-way impacts, the extent of which would be determined in Tier 2.

In Niagara County, Alternative 125 passes along the northeast edge of the Niagara International Airport between MPs QDN21 and QDN23. Between MPs QDN23 and QDN25, Alternative 125 passes near Niagara Town Hall, Niagara Town Court, Niagara Active Hose Company House, and the Niagara Presbyterian Church; however, impacts to these facilities, including the airport, are not anticipated.

6. Surface Waterbodies and Watercourses

6.1 Existing Conditions

6.1.1 Empire Corridor South

The existing surface waterways in the study area are described in the following section, identifying impaired waters, and the NYSDEC water quality classifications are shown in Exhibit G-5. Exhibit G-6 summarizes crossings of waterways by county and by status (impaired or protected waterway). The Empire Corridor South segment, from New York City to Rensselaer, extends 142 miles and in many locations closely follows the east bank of the Hudson River. This program segment includes the study area counties of New York County (Manhattan Borough), Bronx County, Westchester County, Putnam County, Dutchess County, Columbia County, and Rensselaer County. The entire corridor in this

segment is located in the Lower Hudson River watershed.

The rail corridor extends approximately 10.25 miles north through **Manhattan (New York County)** from its southern terminus, daylighting from a rail tunnel just north of Milepost 5. The Hudson River is generally within 150 to 300 feet of the western side of the railroad for the majority of the county. The entire length of the Hudson River in New York County is listed as an impaired water. Just before leaving New York County, the railroad crosses the Harlem River (also known as Spuyten-Duyvil Creek) at a swing-span bridge north of Milepost 10 and just east of the outlet into the Hudson River, before entering Bronx County. The Harlem River is listed as an impaired water by the NYSDEC at this crossing.

After crossing the Harlem River, the rail corridor enters and extends through **Bronx County** a distance of approximately 2.6 miles. There are no waterway crossings in Bronx County, however, the corridor closely adjoins the west bank of the Hudson River throughout the county.

The railroad continues to closely adjoin the Hudson River through 31.5 miles of the rail corridor as it extends through **Westchester County**, largely remaining within 50 to 500 feet of the river. The majority of the rail corridor remains in close proximity to the Hudson River, with the exception of a 1-mile section north of Tarrytown (MPs 25 to 26), another 1-mile section at Croton Point (MPs 33 to 34) that includes the Croton-Harmon Station, north of the Croton Bay crossing, and a roughly 5-mile section between the crossing of Furnace Brook and Peekskill.

There are approximately 23 waterway crossings in Westchester County, including a crossing of the Saw Mill River, a protected water, south of Yonkers Station, and Croton Bay, both a protected and impaired waterway. Of these river crossings, 18 are protected waters (Class C(t) or B or above), and 11 are impaired 303(d) waters. The protected and impaired streams include Kemmeys Cove/Sparta Brook (MP 29.5), Croton Bay (MPs 32.5 to 33, a U.S. Coast Guard permitted Metro-North Bridge), and five unnamed streams (MPs 24, 28.5, 31, 37.5, and 40.5). The protected streams include Saw Mill River (MP 15), Wickers Creek North (MP 21), Gory Brook (MP 26.5), Brinton Brook (MP 36), Furnace Brook (MP 37), Peekskill Bay (MP 42, a U.S. Coast Guard permitted Metro-North Bridge), Broccy Creek (MP 44), and five other unnamed streams (MPs 19.5, 23, 27, 34.5, and 43). Impaired waterways include Dickey Brook, Broccy Creek, and two unnamed streams (MPs 25 and 29).

The railroad continues to closely adjoin the Hudson River through 9.3 miles of the rail corridor as it extends through **Putnam County**, largely remaining within 50 to 500 feet of the river. The majority of the rail corridor remains in close proximity to the Hudson River, with the exception of a 1-mile section south of Cold Springs (MPs 51 to 52), where the Hudson River meanders about ¾-mile to the west of the rail corridor before extending in close proximity to the railroad at Foundry Cove (MP 52).

There are approximately 12 waterway crossings in Putnam County, including several bridges over the inlets and coves of the Hudson River (MP 51, MP 52 [Foundry Cove], and MP 53). Of these 12 crossings, 11 are protected waters (Class C(t) or B or above), and nine are impaired 303(d) waters. The protected and impaired streams include Copper Mine Brook (MP 47), Arden Brook (MP 49.5), Hudson River (MPs 51 and 53), Breakneck Brook (MP 54), and four unnamed streams (MPs 45.5, 47.5, 48 and 48.5). Other protected streams include Foundry Cove (MP 52) and one unnamed stream (MP 46).

The railroad traverses approximately 45.6 miles across **Dutchess County**. The majority of the railroad is within 50 to 300 feet of the Hudson River and crosses several coves and inlets of the river

Exhibit G-5— NYSDEC Surface Water Quality Classifications

Water Quality Class	Designated Uses
Marine Water Designations	
SA	The best usages of these waters are shellfishing for market purposes, primary and secondary contact recreation and fishing. These waters shall be suitable for fish, shellfish, and wildlife propagation and survival.
SB	The best usages of these waters are primary and secondary contact recreation and fishing. These waters shall be suitable for fish, shellfish, and wildlife propagation and survival.
I	The best usages of these waters are secondary contact recreation and fishing. These waters shall be suitable for fish, shellfish, and wildlife propagation and survival.
SC	The best usage for these waters is fishing. These waters shall be suitable for fish, shellfish, and wildlife propagation and survival. The water quality is suitable for primary and secondary contact recreation, although other factors may limit the use for these purposes.
Surface Water Designations	
A-S	The best usages for these waters are: source of water supply for drinking, culinary or food processing purposes; primary and secondary contact recreation; and fishing. The water quality is suitable for fish propagation and survival. This classification is for international boundary waters.
A	The best usages for these waters are the same as for Class/Standard A-S.
B	The best usages for these waters are for primary and secondary contact recreation and fishing. The water quality is suitable for fish propagation and survival.
C	The best usage for these waters is fishing. Water quality is suitable for fish propagation and survival. The water quality is suitable for primary and secondary contact recreation, although other factors may limit the use for these purposes.
C(t)	The best usage for these waters is fishing. The water quality is suitable for trout propagation and survival. Water quality is suitable for primary and secondary contact recreation, although other factors may limit the use for these purposes.
C(ts)	The best usage for these waters is the same as for Class C(t) and is also suitable for trout spawning.

as it passes through the county. The entire Hudson River is listed as an impaired waterway in Dutchess County. There are two areas in Dutchess County where the Hudson River is outside of the railroad's 300-foot buffer: a 1-mile section through the town of Poughkeepsie (MPs 72 to 73), and a roughly 2-mile section through the small hamlet of Staatsburg in the Town of Hyde Park (MPs 83 to 85).

There are approximately 38 waterway crossings in this county, including several tributaries of the Hudson River (MPs 58, 66, 69, 71.5, 77, 85-86, 87, 90, 91, 93.5, 95.5-97 and 98). Of the 38 crossings, 34 are protected waters (Class C(t) or B or above), and 28 are impaired 303(d) waters. The protected and impaired streams include Cascade Brook (MP 56), Gordons Brook/Melzingha Brook (MP 56.5), Hudson River (MPs 66, 69, 77, 87, 90 and 93.5), Casper Creek/Tributary to Cobalt Lake (MP 67), Crum Elbow Creek (MP 79.5), Bard Rock Creek (MP 80.5), Indian Kill (MP 83), Mudder Kill (MP 94.5), South Bay of Hudson River (MPs 95.5 to 97), North Bay of Hudson River (MP 98), and eleven unnamed streams (MPs 61, 63, two at 74.5, 75.5, 81.5, 87.5, 89.5, 90.5, 92.5, and 94). The protected streams include Fishkill Creek/Hudson River (MP 58), Wappinger Creek (MP 65, also known as the New Hamburg Railroad Bridge), Maritje Kill (MP 77), Vandenburg Cove (MPs 85 to 86), Astor Cove (MP 91), and three unnamed streams (two at MP 55.5 and MP 60). Impaired waterways include Casper Creek/Tributary to Cobalt Lake, Fall Kill Creek (MP 73.5), and North Staatsburg Creek (MP 84.5).

The railroad continues to closely adjoin the Hudson River through the majority of the 29.5 miles of

the rail corridor as it extends through **Columbia County**, largely remaining within 50 to 300 feet of the river. The majority of the rail corridor remains in close proximity to the Hudson River, with the exception of two areas: a 3-mile section between the towns of Newton Hook and Stuyvesant (MPs 121 to 124), where the Hudson River meanders about ¼-mile to the west of the rail corridor before extending in close proximity to the railroad at just before the town of Stuyvesant, and a 1-mile section between MP 126 and MP 127 where, again the Hudson River meanders to the west about ¼ -mile from the rail corridor.

There are approximately 22 waterway crossings in Columbia County, including several bridges over the inlets of the Hudson River. Of the 22 crossings, 14 are protected waters (Class C(t) or B or above), and 19 are impaired 303(d) waters. The protected streams include the Hudson River (at least four crossings at MPs 105, 106, 117.5 and 120), which is also an impaired water. Protected and impaired waters include Roeliff Jensen Kill (MP 108), North Bay of the Hudson, and eight unnamed tributaries of the Hudson River (MPs 103.5, 104.5, 107.5, 109.5, 112, 114, 118 and 123.5). Impaired waterways include the Foxes Creek (MP 109), North Bay of the Hudson River (MPs 115-116.5), Mill Creek (MP 126), and three unnamed streams (MPs 121.5, 126.5 and 127.5).

All of the Build Alternatives follow the existing Empire Corridor South for the majority of its length, deviating only in **Rensselaer County**, where Alternative 125 splits off 1.6 miles south of where the existing Empire Corridor turns to the west. The rail corridor continues to closely border the Hudson River through the southern portion of Rensselaer County, but as it approaches Castleton-on-Hudson (MPs 134 to 135), the railroad moves inland and runs parallel to, but further east of, the Hudson River bank. To the north, the river remains outside of the 300-foot buffer study area, extending up to approximately a half-mile away from the river in certain areas. Approximately one mile north of Albany-Rensselaer Station, the existing Empire Corridor (90/110 Study Area) crosses the Hudson River into Albany County at the Livingston Avenue Bridge. There are approximately 10 waterway crossings along the 13.4 miles within the existing Empire Corridor (90/110 Study Area) in Rensselaer County. Of the 10 crossings, none are protected waters (Class C(t) or B or above), and seven are impaired 303(d) waters. The impaired streams include Muitzes Kill (MP 133), Papscanee Creek (MPs 136 and 139), Mill Creek (MP 141.5) and three unnamed streams (MPs 129, 131 and 142.5). The Hudson River is also an impaired water way adjacent to the railroad in this county.

Nearing the county line, the 125 Study Area would cross the Hudson River at MP QH143.5 on a new bridge structure. There are approximately nine waterway crossings in Rensselaer County along the 125 Study Area. Of the nine crossings, none are protected waters (Class C(t) or B or above), and six are impaired 303(d) waters. The impaired streams include Muitzes Kill (MP 133), Papscanee Creek (MPs 136 and 139), Mill Creek (MP QH142.5), and two unnamed streams (MPs 129 and 131). The Hudson River is also an impaired waterway adjacent to the railroad in this county.

Exhibit G-6—Empire Corridor South Surface Water Crossings (for both 90/110 and 125 Study Areas unless otherwise noted)

County (Appx. Mile Post)	River/Stream Crossing (Appx. Mile Post)	Name	Impaired (303(d))/ Priority Water	Protected
New York (0-11.5)	10	Harlem River	Y (MS4)	N

(C) = 303(d) segments impaired by pollutants related to construction, as specified in Appendix E of the NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (Permit No. GP-0-10-001), January 29, 2010.

(MS4) = 303(d) segments impaired by pollutants of concern for municipal separate storm sewer systems (MS4s), as specified in Appendix 2 of the SPDES General Permit for Stormwater Discharges from MS4s (Permit No. GP-0-10-002), October 14, 2011.

The 90/110 Study Area is used for analysis of Alternatives 90A, 90B, and 110 and consists of the existing 464-mile long Empire Corridor alignment. The 125 Study Area is used for analysis of Alternative 125 and consists of portions of the existing Empire Corridor and new alignment and is 450 miles long. The study area width is defined as being within 300 feet of the corridor centerline.

6.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

The Empire Corridor West/Niagara Branch (90/110 Study Area) extends a distance of 322 miles through 13 counties. The Empire Corridor West generally follows or parallels several geographic features, including the Mohawk River or New York Canal System, and the New York State Thruway. The Niagara Branch turns north at Buffalo on Lake Erie, generally paralleling the Lake Erie shoreline and then extending north along the Niagara River. Exhibit G-7 summarizes crossings of waterways by county and by status (impaired or protected waterway).

The railroad crosses over the Hudson River (MP 143) at the Livingston Avenue Bridge where it enters Albany, approximately one mile north of the Albany-Rensselaer Station. The city of Albany sits on the west bank of the Hudson River approximately 150 miles north of New York City. The railroad traverses approximately 11.8 miles across **Albany County**, extends across four waterways at nine crossings. Of the four waterways, two are protected waters (Class C(t) or B or above), and three are impaired 303(d) waters. The protected and impaired streams include Patroons Creek (six crossings at MPs 144, 145, 146, 147, 148 and 149) and Lisha Kill (MP 154). Impaired waterways include the Hudson River (MP 143). The southeastern portion of Albany County is within the Lower Hudson River watershed, but just after the railroad crosses Rensselaer Lake (MP 149), there is a transition to the Mohawk River watershed. Therefore, Lisha Kill is the only crossing of a water body in the Mohawk River watershed within Albany County.

The entire 14.7 miles of the Empire Corridor that pass through **Schenectady County** are located within the Mohawk River watershed. The Mohawk River/Erie Canal cross the railroad just west of the Schenectady Station (MP 160). West of this crossing, the Mohawk River/Erie Canal meanders along the south side of the railroad throughout the remainder of the county at distances between 75 feet to 1 ¼-miles from the railroad.

There are approximately nine waterway crossings in Schenectady County. Of the nine crossings, two are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The protected and impaired streams include the Mohawk River/Erie Canal and an unnamed tributary of the Mohawk River (MPs 161 to 164.5). Impaired waterways include the Collins Creek (MP 161), Washout Creek (MP 166), Verf Kill (MP 168), Chaughtanoonda Creek (MP 169.5), and four unnamed tributaries of the Mohawk River (MPs 158 to 158.5, 161 to 164.5 and two at MP 168.5).

The railroad continues to closely adjoin the north bank of the Mohawk River/Erie Canal through the 40.3 miles of **Montgomery County**, largely remaining within 50 to 1,000 feet of the river/canal. The entire county remains within the Mohawk River watershed. There are approximately 35 waterway crossings in this county, all of which are tributaries to the Mohawk River. Of the 35 crossings, ten are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The protected streams include McQueen Creek (MP 178.75), Briggs Run (MP 190.5), Knauderack Creek (MP 193.5), Zimmerman Creek (MP 207), Timmerman Creek (MP 207.5), Crum Creek (MP 209.5) and four unnamed tributaries of the Mohawk River (three between MPs 180 to 181 and MP 202.5).

Impaired waterways in **Montgomery County**, in addition to the streams above, include Compaanen Kill (MP 170.5), Cranes Hollow Creek (MP 172.5), Degraff Creek (MP 174), North Chuctanunda (MP 176), Danascara Creek (MP 183), Cayadetta Creek (MP 186.5), Caroga Creek (MP 203.5), Mother Creek (MP 204), and 17 other unnamed tributaries to the Mohawk River (MPs 172, 174.5, 177.5, 178.5, 185, 187.5, 188, 194.5, 196, 197, 198, 199, three between MPs 201 to 202, 205 and 206).

The railroad traverses through **Herkimer County** for approximately 25.3 miles, extending parallel and close to the Mohawk River/Erie Canal. The Mohawk River/Erie Canal continues to parallel the south side of the railroad until the town of Frankfurt (MP 228.5), where the Mohawk River separates from the Erie Canal and extends further south. The Erie Canal crosses the railroad at roughly MP 231.5 and the Mohawk River crosses further west at roughly MP 234. Both waterways remain north of the railroad (until Oneida County), west of these crossings.

There are approximately 19 waterway crossings in Herkimer County. Of the 19 crossings, four are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The protected streams include East Canada Creek (MP 210), Beaver Brook (MP 220), West Canada Creek (MP 223) and Ferguson Creek (MP 234.5). In addition to the above-mentioned crossings, impaired waterways include the Bridenbecker Creek (MP 229.5), the Erie Canal (MP 231.5), Mohawk River (MP 234) and 12 unnamed tributaries of the Mohawk River (nine between MPs 211 to 219.5 and three between MPs 223 to 229).

The Empire Corridor extends 28.6 miles through **Oneida County**, paralleling the Erie Canal between Utica and Rome, where the canal diverges west to flow into Oneida Lake. The eastern half of Oneida County is within the Mohawk River watershed, but west of the Rome Station (MP 261.5) is the drainage divide with the Oswego River/Finger Lakes watershed. There are approximately 12 waterway crossings in this county, of which four are protected waters (Class C(t) or B or above) and all are impaired 303(d) waters. The protected streams include Starch Factory Creek (MP 235.5), Sauquoit Creek (MP 240.5), Oriskany Creek (MP 244.5) and the Mohawk River (MP 248.5). In addition to the above-mentioned crossings, impaired waterways also include Mad Creek (MPs 256 to 256.5), Stony Creek (MP 261) and five unnamed tributaries to Wood Creek between MPs 250.5 and 255.

The railroad extends 13.8 miles through **Madison County**, which is situated entirely within the Oswego River/Finger Lakes watershed. In the eastern half of the county, the railroad generally parallels the Old Erie Canal, within 100 to 1,000 feet to the south. At MP 272, the Old Erie Canal flows under the railroad, extending south and out of the study area. There are approximately 11 waterway crossings in this county. Of the 11 crossings, four are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The protected streams include Oneida Creek (MP 264), Canastota Creek (MP 270), Old Erie Canal/Owlville Creek (MP 272) and Chittenango Creek (MP 276.5). In addition to the above-mentioned crossings, impaired waterways also include Cowaselon Creek (MP 266), Duck Settlement Creek (MPs 268 to 268.5), Canaseraga Creek (MP 273.5) and four unnamed streams (MPs 274, 275, 277 and 278).

The railroad extends 31.3 miles through **Onondaga County**, roughly paralleling the New York State Thruway and skirting the southeast shores Onondaga Lake in the city of Syracuse. There are approximately 16 waterway crossings in this county and all are within the Oswego River/Finger Lakes watershed. Of the 16 crossings, four are protected waters (Class C(t) or B or above), and 13 are impaired 303(d) waters. The protected streams include Lake Brook (MP 280.5), Dead Creek/White Bottom Creek (MP 303.5), Carpenters Brook (MP 305.5) and Skaneateles Creek (MP 308). In addition to the above-mentioned crossings, impaired waterways also include Pools Brook (MP 278.5), Limestone Creek (MP 282.5), Butternut Creek (MP 285), South Branch Ley Creek (MP 287), Erie Canal (MP 292), Geddes Brook (MP 295) and three unnamed streams (MPs 281, 288 and 308.5). Three other streams, none of which are protected or impaired, cross the railroad in this county: Nine Mile Creek (MP 296.5), Bitter Brook (MP 302) and the Old Erie Canal (MPs 302.5 to 303).

The Empire Corridor extends 11.5 miles through **Cayuga County**, roughly paralleling the New York State Thruway. There are approximately five waterway crossings in this county and all are within the Oswego River/Finger Lakes watershed. Of the five crossings, none are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. Impaired waterways include Putnam Brook (MP 312), Spring Brook (MP 312.5), Owasco Outlet (MP 316), Swamp Brook (MP 316.5) and the Seneca River (MP 319.5).

The railroad extends 37.1 miles through **Wayne County**, paralleling portions of the Erie Canal and Route 31. The Erie Canal meanders back and forth along the railroad for much of the county, crossing the rail corridor east of the town of Lyons (MP 335) and east of the town of Newark (MP 339.5). Approximately 98 percent of the railroad is located within the Oswego River/Finger Lakes watershed in Wayne County. Just before the western border of the county, the railroad enters the Lake Ontario Tributaries watershed (MP 357).

There are approximately 18 waterway crossings in this county, including the two Erie Canal crossings mentioned above. Of the 18 crossings, five are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The protected streams include Canandaigua Creek (MP 336), Marletown Creek/tributaries (MPs 327 to 329), Ganargua Creek (MPs 342 to 347), Red Creek (MPs 351 to 352) and an unnamed tributary to the Erie Canal (MPs 354.5 to 355). In addition to the above-mentioned crossings, impaired waterways also include the Seneca River (MP 320), Black Creek (MPs 324 and 325), the Old Erie Canal (MP 326.5), Clyde River (MPs 328 to 330), Black Brook/Old Erie Canal (MP 332), Erie Canal and five unnamed streams (two at MP 322; MPs 323, 325.5, 341 and 345).

The railroad extends 30.9 miles through **Monroe County**, closely paralleling the Erie Canal from the county's eastern county line to west of the town of Fairport (MP 361.5), where the canal meanders south. The canal extends within the study area again west of the city of Rochester and crosses the railroad just east of Interstate 390 (MP 374.5), extending north out of the study area (until Niagara County). The eastern portion the county remains in the Lake Ontario Tributaries watershed, and the drainage divide with the Genesee River watershed (MP 370.5), is just east of Rochester and the Genesee River crossing (MP 371.5).

There are approximately 19 waterway crossings in Monroe County, including the Erie Canal crossing mentioned above. Of the 19 crossings, six are protected waters (Class C(t) or B or above), and 13 are impaired 303(d) waters. The protected streams include Thomas Creek (MPs 359.5 to 362), Irondequoit Creek (MP 363), Allen Creek (MP 365.5), Genesee River, Erie Canal and Little Black Creek (MP 377.5). In addition to the above-mentioned crossings, impaired waterways also include an additional crossing of Irondequoit Creek (MP 367.5) and nine unnamed streams (MP 379, six between MPs 380.5 to 383.5 and two between MPs 385 to 385.5).

The railroad traverses approximately 30 miles through **Genesee County**, generally following Route 33. The railroad remains in the Genesee River watershed through the eastern portion of the county and passes into the Niagara River/Lake Erie watershed east of the town of Batavia (MP 401). There are approximately 17 waterway crossings in Genesee County. Of the 17 crossings, four are protected waters (Class C(t) or B or above), and 13 are impaired 303(d) waters. The protected streams include Bigelow Creek/Godfrey Pond (MP 398.5), Tonawanda Creek (MP 403.5) and two unnamed streams (MPs 399.5 and 407). In addition to the above-mentioned crossings, impaired waterways also include Robins Brook (MPs 392.5 and 394), Black Creek (MP 396.5), Bowen Creek (MP 408.5), Murder Creek (MP 414), and seven unnamed streams (MPs 389, 395, 401, 412, 415, 416 and 417.5). The railroad also crosses an unnamed pond in Genesee County (MP 402), which is neither protected nor impaired.

The railroad extends 32.7 miles through **Erie County**, which is situated entirely within the Niagara River/Lake Erie watershed. The eastern segment follows Route 33, then Route 130 to the city of Buffalo, a distance of 20 miles. The Niagara Branch of the railroad turns north to follow the Lake Erie shoreline and then follows Route 265 north, roughly parallel to, and within 50 feet to 2.5 miles east of, the Niagara River, for a distance of 12.7 miles. Of the seven waterway crossings in this county, three are protected waters (Class C(t) or B or above), and six are impaired 303(d) waters. The protected and impaired waters include Ellicott Creek (MP 422.5), Scajaquada Creek (MP QDN6), and an unnamed tributary to Ellicott Creek (MP 418.5). The other impaired waterways include Ellicott Creek (MP QDN12.5), the North Branch of Plum Bottom Creek (MP 425.5), and one other unnamed stream (MP QDN7.5).

The railroad extends 14.4 miles through **Niagara County** within the Niagara River/Lake Erie watershed. The railroad follows the shoreline of the Niagara River, then extends north towards the Niagara Falls International Airport, turning west to terminate at Niagara Falls. Of the nine waterway crossings in the county, none are protected waters (Class C(t) or B or above), and eight are impaired 303(d) waters. The impaired waterways include Tonawanda Creek/Erie Canal (MP QDN13.5), Black Creek (MP QDN18), East Branch of Black Creek (MP QDN18.5), Sawyer Creek (MP QDN19.5), Bergholtz Creek (MP QDN20), Cayuga Creek (MP QDN21), Branch Gill Creek (MP QDN25) and Gill Creek (MP QDN26).

Notes: Appx.= Approximate, Y = Yes, N = No

(C) = 303(d) segments impaired by pollutants related to construction, as specified in Appendix E of the NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (Permit No. GP-0-10-001), January 29, 2010.

(MS4) = 303(d) segments impaired by pollutants of concern for municipal separate storm sewer systems (MS4s), as specified in Appendix 2 of the SPDES General Permit for Stormwater Discharges from MS4s (Permit No. GP-0-10-002), October 14, 2011.

The 90/110 Study Area is used for analysis of Alternatives 90A, 90B, and 110 and consists of the existing 464-mile long Empire Corridor alignment. The study area width is defined as being within 300 feet of the corridor centerline.

6.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

The Empire Corridor West/Niagara Branch 125 Study Area follows a more direct route between Rensselaer and Buffalo, and does not closely adjoin the New York State Canal system. Exhibit G-8 summarizes crossings of waterways by county and by status (impaired/priority or protected waterway). The 125 Study Area crosses over the Hudson River (MP QH143.5), entering **Albany County** 1.8 miles south of the Livingston Avenue Bridge. The railroad skirts the southern boundary of the city of Albany and continues through Albany County over a distance of roughly 14 miles, crossing over Krum Kill at two locations. Of the two waterways crossed, only Krum Kill is a protected water (Class C(t) or B or above), and both the Hudson River and Krum Kill are impaired 303(d) waters. The entire county is within the Lower Hudson River watershed.

The 125 Study Area extends 17 miles through **Schenectady County** and remains in the Lower Hudson River watershed for approximately 1.5 miles before crossing into the Mohawk River watershed. It then passes back into the Lower Hudson River watershed for a majority of the county before crossing back into the Mohawk River watershed, just before MP QH171. The 125 Study Area crosses approximately 18 waterway crossings in Schenectady County. Of the 18 crossings, three are protected waters (Class C(t) or B or above), and 15 are impaired 303(d) waters. The protected and impaired streams include three unnamed tributaries to Norman's Kill (MPs QH161.5, QH168.25 and QH170.5). Impaired waterways include the Bonny Brook (MP QH163.5) and 11 unnamed tributaries (MPs QH158.75, QH160.5, QH162.75, QH164.5, QH166, QH166.5, QH167.5, QH168.25, QH168.5, QH171.25 and QH172.25).

The 125 Study Area remains in the Mohawk River watershed throughout the 6.5 miles in **Schoharie County**. The 125 Study Area crosses approximately nine waterway crossings in Schoharie County. Of the nine crossings, none are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The impaired streams include Schoharie Creek (crossings at MPs QH174 and QH174.5 to QH175.75), Fly Creek (MPs QH179.5, QH180.25 and QH180.5), and four unnamed tributaries to Schoharie Creek (MPs QH174.25, QH176, QH177.5 and QH177.75).

The 125 Study Area continues within the Mohawk River watershed along the 21.3-miles through **Montgomery County**. The entire county remains within the Mohawk River watershed. There are approximately 21 waterway crossings in this county, most of which are tributaries to the Fly Creek, Mohawk River or Canajoharie Creek. Of the 21 crossings, one is a protected water (Class C(t) or B or above), and all are impaired 303(d) waters. The protected and impaired streams include an unnamed tributary to the Mohawk River (MP QH201.5). Impaired waterways in Montgomery County, in addition to the streams above, include Fly Creek (MPs QH181 and QH181.25), Flat Creek (MP QH188), Canajoharie Creek (MP QH192.5), four unnamed tributaries to Fly Creek (MPs QH182, QH182.5, QH185.5 and QH186.5), three unnamed tributaries to Canajoharie Creek (MPs QH190.75, QH191 and QH193) and nine other unnamed tributaries to the Mohawk River (MPs QH196.25, QH196.5, QH196.75, QH197.5, QH199.25, QH200, QH200.5, QH200.75 and QH201).

The 125 Study Area traverses through rural **Herkimer County** for approximately 25.3 miles. The entire county remains within the Mohawk River watershed. There are approximately 39 waterway crossings in Herkimer County. Of the 39 crossings, 15 are protected waters (Class C(t) or B or above), and 37 are impaired 303(d) waters. Protected streams include one unnamed tributary to the Erie Canal (MP QH223.5) and the unnamed tributary to Starch Factory Creek (MP QH257). The impaired and protected streams include Otsquago Creek (MP QH202.5), Ohisa Creek (MP QH206.5), Fulmer Creek (MPs QH212 and QH215), two unnamed tributaries to the Mohawk River (MPs QH202.5 and

QH208), one unnamed tributary to Ohisa Creek (MP QH207), and six unnamed tributaries to the Erie Canal (MPs QH218, QH221.5, QH222.5, QH222.75, QH223, and QH223.25). In addition to the above-mentioned crossings, impaired waterways include two unnamed tributaries to Otsquago Creek (MPs QH203.75 and QH204), two unnamed tributaries to Ohisa Creek (MPs QH206 and QH206.25), one unnamed tributary to the Mohawk River (MP QH209.5), seven unnamed tributaries to Fulmer Creek (MPs QH210.75, QH211.5, QH212.5, QH213.75, QH214.25, QH214.5 and QH215.25), eight unnamed tributaries to the Erie Canal (MPs QH216.75, QH217.75, QH218.75, QH219.5, QH219.75, QH220, QH220.5 and QH221), one unnamed pond (MP QH224.25), one unnamed tributary to Ferguson Creek (MP QH225.5), and two unnamed tributaries to Starch Factory Creek (MPs QH226 and QH226.5).

The 125 Study Area extends 22 miles through **Oneida County**, primarily traversing rural properties. The eastern half of Oneida County is within the Mohawk River watershed, but as the corridor crosses County Road 26 (Rome Road) (MP QH242) the corridor enters the Oswego River/Finger Lakes watershed. There are approximately 18 waterway crossings in this county, of which seven are protected waters (Class C(t) or B or above) and all are impaired 303(d) waters. The protected streams include Sauquoit Creek (MP QH230.25), Mud Creek (MP QH234.5), Sherman Brook (MP QH235.5), Oriskany Creek (MP QH236), Sconondoa Creek (MP QH248), one unnamed tributary to Sauquoit Creek (MP QH228) and two unnamed tributaries to Mud Creek (MPs QH232.5 and QH233.25). In addition to the above-mentioned crossings, impaired waterways also include Palmer Creek (MP QH229.5), one unnamed tributary to Sauquoit Creek (MP QH230.25), three unnamed tributaries to Oriskany Creek (MPs QH237, QH238.25 and QH238.5), three unnamed tributaries to Deans Creek (MPs QH239.75, QH240 and QH240.75) and two unnamed tributaries to Stony Creek (MPs QH245 and QH246).

The corridor extends 14.6 miles through **Madison County**, which is situated entirely within the Oswego River/Finger Lakes watershed. At MP QH260.5 and QH262.5, the Old Erie Canal flows under the corridor, extending south and out of the study area. There are approximately 20 waterway crossings in this county. Of the 20 crossings, five are protected waters (Class C(t) or B or above), and all are impaired 303(d) waters. The protected streams include Canastota Creek (MP QH255.75), Owlville Creek (MP QH257.5), Canaseraga Creek (MP QH260), Chittenango Creek (MP QH262.25) and one unnamed tributary to Canaseraga Creek (MP QH260.25). In addition to the above-mentioned crossings, impaired waterways also include Oneida Creek (MP QH249.5), Cowselon Creek (MP QH253), Dutch Settlement Creek (MP QH254.5), the Old Erie Canal, three unnamed tributaries to Oneida Creek (MPs QH249.75, QH250 and QH251), an unnamed pond (MP QH252.5), five unnamed tributaries to the Old Erie Canal (MPs QH253.5, QH254, QH259, QH262.75 and QH264) and one unnamed tributary to Owlville Creek (MP QH258.25).

The corridor extends 31.6 miles through **Onondaga County**, merging with the Empire Corridor West 90/110 Study Area just east of Syracuse. At this location it roughly parallels the New York State Thruway and skirts the southeast shores of Onondaga Lake in the city of Syracuse. There are approximately 20 waterway crossings in this county and all are within the Oswego River/Finger Lakes watershed. Of the 20 crossings, five are protected waters (Class C(t) or B or above), and 15 are impaired 303(d) waters. The protected streams include Pools Brook (MP QH264.75), Lake Brook (MP QH266.5), two unnamed tributaries to Pools Brook (MPs QH265 and 265.25), and one unnamed tributary to the Seneca River (MP QH292). In addition to the above-mentioned crossings, impaired waterways also include Limestone Creek (MP QH268.5), Butternut Creek (MP QH270.5), South Branch Ley Creek (MP QH272.5), Erie Canal (MP QH278.5), Geddes Brook (MP QH281.75), Dead Man Creek (MP QH289.75), one unnamed tributary to Ley Creek (MP QH274), one unnamed tributary to Nine Mile Creek (MP QH286), and two unnamed tributaries to Dead Man Creek (MPs QH290 and QH290.75). Three other streams, none of which are protected or impaired, cross the corridor in this

Onondaga County: the old Erie Canal (MP QH265.75), Nine Mile Creek (MP QH283) and three unnamed tributaries to Nine Mile Creek (MPs QH285, QH285.25 and QH286.5).

The 125 Study Area extends 11.1 miles through **Cayuga County**, north of the Empire Corridor West (90/110 Study Area). There are approximately 15 waterway crossings in this county, all of which are within the Oswego River/Finger Lakes watershed. Of the 15 crossings, one is a protected water (Class C(t) or B or above), and 12 are impaired 303(d) waters. Protected waters include the Seneca River (MP QH295.75). In addition to the Seneca River, impaired waterways include Muskrat Creek (MP QH297.5), Spring Lake Outlet (MPs QH305.5, QH305.75 and QH306.25), one unnamed pond (MPs QH298.5 to QH299) and six unnamed tributaries to the Seneca River (MPs QH299.5, QH300, QH301.25, QH301.75, QH303.5, and QH304).

The 125 Study Area extends 35.5 miles through **Wayne County**. Approximately 98 percent of the railroad is located with the Oswego River/Finger Lakes watershed in Wayne County. Just before the western border of the county, the railroad enters the Lake Ontario Tributaries watershed (MP 357).

There are approximately 43 waterway crossings in Wayne County. Of the 43 crossings, three are protected waters (Class C(t) or B or above), and 42 are impaired 303(d) waters. The protected streams include Millpond (MP QH310.5), Sodus Creek (MP QH316.5) and an unnamed tributary to Mudge Creek (MP QH313.5). In addition to the above-mentioned crossings (with the exception of the unnamed tributary to Mudge Creek), impaired waterways also include Butler Creek (MP QH308.5), Wolcott Creek (MP QH311.75), Black Creek (MP QH312.5), Red Creek (MPs QH331.75 and QH335.75), an unnamed tributary to the Seneca River (MP QH306.75), an unnamed tributary to Butler Creek (MP QH309), two unnamed streams (MPs QH310.5 and QH310.75), two unnamed tributaries to Black Creek (MPs QH314.5 and QH315.25), two unnamed tributaries to Sodus Creek (MPs QH316 and QH316.75), 10 unnamed tributaries to the Clyde River (MPs QH317.75, QH318.5, QH319, QH319.5, QH320.25, QH320.75, QH321.5, QH322.5, QH323 and QH323.75), 10 unnamed tributaries to Ganargua Creek (MPs QH324.5, QH325.5, QH326.5, QH327, QH327.25, QH329.5, QH333, QH333.5, QH333.75 and QH334.75) and seven unnamed tributaries to Red Creek (MPs QH331, QH332.5, QH334, QH337.5, QH338.25, QH338.75 and QH340.5-QH341).

The 125 Study Area extends 29.5 miles through **Monroe County**. The county remains in the Lake Ontario Tributaries watershed until just east of Rochester where the railroad enters the Genesee River watershed, just before crossing the Genesee River (MP QH356). The corridor merges with the Empire Corridor West (90/110 Study Area) east of Rochester continuing west through the city before the 125 Study Area diverges to the north. The Erie Canal crosses the corridor at MP QH359.

The 125 Study Area crosses approximately 23 waterway crossings in Monroe County, including the Erie Canal crossing mentioned above. Of the 23 crossings, 9 are protected waters (Class C(t) or B or above), and 18 are impaired 303(d) waters. The protected streams include Thomas Creek (MPs QH345.5 to QH346.5), Irondequoit Creek (MP QH347.5), Allen Creek (MP QH350.25), Genesee River (MP QH356.75), Erie Canal (MP QH359), three unnamed tributaries to Thomas Creek (MPs QH342.5, QH343.5 and QH344) and an unnamed pond (MP QH342.75). In addition to the above-mentioned crossings, impaired waterways also include and additional crossing of Irondequoit Creek (MP QH351.75), Little Black Creek (MPs QH363.75 and QH365.25), and six unnamed tributaries to Black Creek and Little Black Creek (MPs QH363, QH363.5, QH367.25, QH369, QH371 and QH371.5).

The 125 Study Area traverses approximately 29.7 miles through **Genesee County**. The county remains in the Lake Ontario Tributaries watershed until just east of Rochester where the railroad enters the Genesee River watershed, just before crossing the Genesee River (MP QH356). There are

approximately 25 waterway crossings in Genesee County. Of the 25 crossings, one is a protected water (Class C(t) or B or above), and 22 are impaired 303(d) waters. The protected stream includes Tonawanda Creek (MP QH397.5). In addition to the above-mentioned crossings, impaired waterways also include Black Creek (MPs QH375.75 and QH377), Oak Orchard Creek (MP QH383.5), Whitney Creek (MP QH395.5), Murder Creek (MP QH400.5), four unnamed tributaries to Black Creek (MPs QH372.5, QH373.25, QH374.25 and QH377.25), two unnamed tributaries to Spring Creek (MP QH381 and MPs QH382 to QH383), six unnamed tributaries to Oak Orchard Creek (MPs QH385, QH385.5, QH386, QH387.25, QH388 and QH389.25), an unnamed pond (MP QH389.75), an unnamed tributary to Brinningstool Creek (MP QH393), an unnamed tributary to Tonawanda Creek (MPs QH396.5 to QH397) and an unnamed tributary to Murder Creek (MP QH401).

The 125 Study Area extends 35.3 miles through **Erie County**, which is situated entirely within the Niagara River/Lake Erie watershed. The eastern segment merges with the Empire Corridor West/Niagara Branch (90/110 Study Area) east of Depew. The Empire Corridor then turns north to follow the Lake Erie shoreline. The corridor then continues north, roughly parallel to, and within 50 feet to 2.5 miles east of, the Niagara River, for a distance of 12.7 miles. Of the 10 waterway crossings in this county, two are protected waters (Class C(t) or B or above), and six are impaired 303(d) waters. The protected and impaired waters include Ellicott Creek (MP QH411.5) and Scajaquada Creek (MP QDN6). The other impaired waterways include Ransom Creek (MPs QH406.5 and QH408.75), Ellicott Creek (MP QDN12.5), and one other unnamed stream (MP QDN7.5).

The railroad extends 14.4 miles through **Niagara County** within the Niagara River/Lake Erie watershed. The railroad follows the shoreline of the Niagara River, then extends north towards the Niagara Falls International Airport, turning west to terminate at Niagara Falls. Of the nine waterway crossings in the county, none are protected waters (Class C(t) or B or above), and eight are impaired 303(d) waters. The impaired waterways include Tonawanda Creek/Erie Canal (MP QDN13.5), Black Creek (MP QDN18), East Branch of Black Creek (MP QDN18.5), Sawyer Creek (MP QDN19.5), Bergholtz Creek (MP QDN20), Cayuga Creek (MP QDN21), Branch Gill Creek (MP QDN25) and Gill Creek (MP QDN26).

6.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.6). The potential effects impacts of the Base Alternative and other Build Alternatives are described in more detail below.

6.2.1 Base Alternative

Improvements from the eight projects for track and station infrastructure comprising the Base Alternative, which have been completed, were anticipated in the Tier 1 Draft EIS to involve approximately 68 surface water crossings.

6.2.2 Alternative 90A

Improvements from this alternative that follows the existing Empire Corridor would have approximately 107 surface water crossings.

Notes: Appx.= Approximate, Y = Yes, N = No

(C) = 303(d) segments impaired by pollutants related to construction, as specified in Appendix E of the NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (Permit No. GP-0-10-001), January 29, 2010.

(MS4) = 303(d) segments impaired by pollutants of concern for municipal separate storm sewer systems (MS4s), as specified in Appendix 2 of the SPDES General Permit for Stormwater Discharges from MS4s (Permit No. GP-0-10-002), October 14, 2011.

The 125 Study Area is used for analysis of Alternative 125 and consists of portions of the existing Empire Corridor and new alignment and is 450 miles long. The study area width is defined as being within 300 feet of the corridor centerline.

Surface Waters/Floodplains Exhibit G-8

Tier 1 EIS
High Speed Rail
Empire Corridor Program

Empire Corridor South

Alternative 90A improvements along Empire Corridor South would involve 47 waterway crossings. Alternative 90A would include construction of four miles of second track through urbanized areas of Manhattan (MPs 9 to 13), and 1.4 miles (MPs 23.8 to 25.2) of new track, extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking. Both projects would occur over waterways associated with the tributaries of the Hudson River, including the Harlem River at MP 10. In addition, the rail line would be located directly adjacent to the Hudson River in these improvement areas. Depending on design, these improvements could have the potential to impact surface waters and water quality.

With Alternative 90A, there would be signal improvements proposed along 43 miles (MPs 32.8 and 75.8). In addition, along this section there would be 10 miles of new third track (MPs 53 to 63) and there would be improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8). North of Poughkeepsie and south of Albany-Rensselaer Station (MPs 75.8 to 140), proposed improvements would also include rock slope stabilization (MPs 105 to 130) and three new control points (CP 82, CP 99, and CP 136), as well as station improvements at Rhinecliff Station (high-level platforms) and Hudson Station (new Ferry Street Bridge and track realignments). In addition, the rail line would be located directly adjacent to the Hudson River in these improvement areas. Impacts to surface waters and water quality would be more likely in areas where there would be new track construction.

Empire Corridor West/Niagara Branch

Alternative 90A would also include replacement of the Livingston Avenue Bridge, which would pass over the Hudson River at the Rensselaer/Albany County Line; therefore, work on this bridge could have the potential to impact surface water and water quality associated with the Hudson River. With Alternative 90A, track improvements would include 10 miles of third track between MPs 169 and 179, and Amsterdam Station improvements along the west end of this segment. This entire 10-mile segment would closely adjoin the banks of the Mohawk River and would cross approximately nine waterways. Although impacts in these areas could be contained within the current right-of-way, there would still be potential for minimal impact of surface waters and water quality.

West of MP 175, work extending to MP 295 would consist of upgrading interlocking, automatic block signals, and control points. Alternative 90A would also include Syracuse Station track improvements (MPs 290 to 294) within this improvement segment. The alignment would continue to closely adjoin the banks of the Mohawk River and Erie Canal through MP 253. In addition to three crossings already included in the 10 miles of third track improvements mentioned above, the alignment would cross approximately 27 waterways between MPs 175 and 295. Although work would consist of upgrading signals, control points and interlocking, and this work would be performed within the current right-of-way, it could minimally impact surface waters and water quality within improvement areas.

Alternative 90A would include third track improvements along nine miles (MPs 373 to 382) west of Rochester station. Alternative 90A would also include the addition of a third track along 11 miles (MPs 382 to 393) in western Monroe and eastern Genesee Counties. Together, these improvements could impact approximately 16 streams, depending on eventual design.

Station improvements at the Buffalo-Depew Station (MPs 429.5 to 432.5) would not cross any waterways, and would be anticipated to have no impact on surface waters or water quality. However, the proposed double track (MPs QDN17 to QDN23.2) and Niagara Falls track improvements (MPs

QDN25 to QDN28) could have the potential to impact surface waters and water quality associated with seven waterway crossings.

6.2.3 Alternative 110

Improvements from this alternative would have approximately 218 surface water crossings.

Empire Corridor South

No additional work within Empire Corridor South, other than the potential for 47 waterway crossings for Alternative 90A, is proposed and additional surface waters impacts would not be anticipated to occur.

Empire Corridor West/Niagara Branch

There is only one difference in impacts between Alternative 110 and either 90A or 90B: Alternative 110 does not propose double track in the area of Scajaquada Creek (MP QDN6) in Erie County. Otherwise, track realignments and third and fourth track improvements would traverse the same surface waterways described in Alternatives 90A and 90B. These alternatives would include a crossing of the Hudson River and would closely adjoin sections of the Mohawk River and Erie Canal.

6.2.4 Alternative 125

Alternative 125 would potentially involve a total of 361 surface water crossings, as described below.

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. Alternative 90A improvements along Empire Corridor South would involve 47 waterway crossings. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River.

Empire Corridor West/Niagara Branch

Alternative 125 would involve a new sealed corridor. The potential for impacts to these waterway crossings are not yet fully known in Tier 1. In general, actions that would constitute direct impacts include the destruction or alteration of all or part of the surface water through diversion, channelization, embankments construction, dredging, filling, or other direct modifications of the waterway. In addition, direct impacts include the deterioration of the surface water quality through the direct discharge of pollutants and/or sediment to the waterway during construction.

In Albany County, Alternative 125 would cross three waterways: the Hudson River, and two crossings at Krum Kill. In addition to these crossings, there would also be one crossing in Albany County associated with Alternative 90A improvements of the Livingston Avenue Bridge over the Hudson River.

In Schenectady and Schoharie counties, Alternative 125 would cross approximately 27 waterways.

In addition in Schenectady County, Alternative 90A improvements would also occur under Alternative 125 and include one surface water crossing.

Alternative 125 would extend through Montgomery County, where there are approximately 21 waterway crossings. Alternative 90A improvements that would also occur under Alternative 125 would include 28 surface water crossings in Montgomery County.

In Herkimer County, Alternative 125 would cross approximately 39 waterways.

In Oneida County, Alternative 125 would extend through primarily rural properties and cross approximately 18 mapped waterways. Alternative 125 would also extend through primarily rural properties in Madison County and would cross approximately 20 waterways.

In Onondaga County, there would be approximately 20 water crossings in this county, six of which would be along the existing railroad through Syracuse.

In Cayuga County, Alternative 125 would cross 15 waterways. In Wayne County, Alternative 125 would cross approximately 43 waterways.

In Monroe County, Alternative 125 would cross 23 waterways, seven of which would be along the existing railroad through Rochester.

In Genesee County, Alternative 125 would extend through primarily rural properties and would cross approximately 25 mapped waterways.

New track proposed for Alternative 125 would cross six waterways in Erie County.

7. Navigable Waters

7.1 Existing Conditions

7.1.1 Empire Corridor South

All of the Build Alternatives follow the existing Empire Corridor South for the majority of its length, deviating only in Rensselaer County, where Alternative 125 splits off 1.6 miles south of where the existing Empire Corridor (the 90/110 Study Area) turns to the west. The Hudson River, a navigable water, is within the 300-foot railroad buffer in all counties in the Empire Corridor South segment. There are several navigable tributaries and inlets of the Hudson River that the railroad crosses. The Spuyten-Duyvil railroad bridge crosses over the Harlem River at MP 10. Two Metro-North railroad bridges in Westchester County pass over the Hudson River: Croton Bay (MPs 32.5 to 33) and Peekskill Bay (MP 42). The New Hamburg Railroad Bridge crosses over Wappinger Creek at MP 65.

7.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

There are several navigable waterways along the 322 miles of the Empire Corridor West/Niagara Branch 90/110 Study Area. The Erie Canal and Mohawk River and other navigable waterways, and crossings of navigable waters, are described in the following section.

The railroad crosses the Hudson River over the Livingston Avenue Railroad bridge as it passes into **Albany County**. The Hudson River at this location is a navigable water, and the bridge is permitted by the U.S. Coast Guard.

The Erie Canal is part of the Mohawk River in **Schenectady County**. This waterway meanders in and out of the 300-foot buffer and crosses the railroad, as it passes west of the city of Schenectady (MP 160).

The Mohawk River and Erie Canal meander through the 300-foot buffer area as a single water channel in **Montgomery County** and the eastern part of **Herkimer County**, never crossing the railroad alignment. The Mohawk River and Erie Canal split at the town of Frankfort (MP 228). The Mohawk River and Erie Canal parallel the south side of the railroad before crossing the railroad and heading north. The Erie Canal crosses the railroad at approximately MP 231.5 and the Mohawk River crosses at approximately MP 234.

The Mohawk River and the Erie Canal continue into **Oneida County**, with both located north of the railroad. The Mohawk River crosses the railroad, extending from the north to the south side, just east of Rome (MP 248.5).

There are no navigable waters in **Madison County**. In **Onondaga County**, there are two navigable waterways: the Erie Canal and Onondaga Lake. Onondaga Lake parallels the north side of the railroad alignment for a small section through Syracuse. The Erie Canal crosses the alignment in this same area (MP 292) and connects to Onondaga Lake.

There are no navigable waters in the study area in **Cayuga County**. The Erie Canal is the only navigable water in the study area in **Wayne County**, meandering in and out of the 300-foot buffer within this county and crossing the railroad three times. It crosses once as part of the Clyde River near the town of Clyde (MPs 328 to 330), once near the town of Lyons (MP 335) and once just before Newark (MP 339.5).

The Genesee River and the Erie Canal are the two navigable waters within the study area in **Monroe County**. The Genesee River crosses the rail alignment in the city of Rochester (MP 371.5). The Erie Canal crosses the rail alignment just west of Rochester (MP 374.5). There are no navigable waters in the study area in **Genesee County**.

There are three navigable waters in the study area in **Erie County**. Two of these, Ellicott Creek and Scajaquada Creek, cross the railroad. The third, Lake Erie, is located within the 300-foot buffer on the west side of the railroad. Ellicott Creek crosses the rail alignment twice, once before entering Buffalo (MP 422.5) and a second time in Tonawanda (MP QDN12.5). Scajaquada Creek crosses the railroad once in Buffalo (MP QDN6).

There is one navigable water in **Niagara County**, Tonawanda Creek. The creek is also part of the Erie Canal and crosses the railroad in the center of Tonawanda (MP QDN13.5).

7.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

There are several navigable waterways along the 308 miles of the Empire Corridor West/Niagara Branch 125 Study Area. The corridor crosses the Hudson River at MP QH143.5 as it passes into

Albany County. The Hudson River at this location is a navigable water.

There are no navigable waters in the study area through Schenectady, Schoharie, Montgomery, Herkimer, Oneida or Madison counties. The 125 Study Area bypasses several crossings of the Mohawk River/Erie Canal along the Empire Corridor West in Schenectady, Montgomery, Herkimer, and Oneida counties.

In **Onondaga County**, there are two navigable waterways: Onondaga Lake and the Erie Canal. Onondaga Lake parallels the north side of the corridor for a small section through Syracuse. The Erie Canal crosses the corridor in this same area (MP QH278.5) and connects to Onondaga Lake.

There are no navigable waters in the study area in **Cayuga** or **Wayne Counties**. The 125 Study Area bypasses several crossings of the Erie Canal and Clyde River along the Empire Corridor West in Wayne County. The Genesee River and the Erie Canal are two navigable waters within the study area in **Monroe County**.

The Genesee River crosses the corridor in the city of Rochester (MP QH356.75). The Erie Canal crosses the corridor just west of Rochester (MP QH359). There are no navigable waters in the study area in **Genesee County**.

There are three navigable waters in the study area in **Erie County**. Two of these, Ellicott Creek and Scajaquada Creek, cross the alignment. The third, Lake Erie, is located within the 300-foot buffer on the west side of the alignment. Ellicott Creek crosses the rail alignment twice, once before entering Buffalo (MP 411.5) and a second time in Tonawanda (MP QDN12.5). Scajaquada Creek crosses the railroad once in Buffalo (MP QDN6).

There is one navigable water in **Niagara County**, Tonawanda Creek. The creek is also part of the Erie Canal and crosses the railroad in the center of Tonawanda (MP QDN13.5).

7.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.8). The potential effects impacts of the Base Alternative and other Build Alternatives are described in more detail below.

7.2.1 Base Alternative

Empire Corridor South

The Base Alternative represents the baseline condition against which the alternatives are measured, and it incorporates improvements that had already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies. The Tier 1 Draft EIS addressed impacts of the eight projects comprising the Base Alternative on navigable waterways, which included work that spanned over three to four navigable waterways.

7.2.2 Alternative 90A

Empire Corridor South

Alternative 90A would include construction of four miles of second track through urbanized areas of Manhattan (MPs 9 to 13), and 1.4 miles (MPs 23.8 to 25.2) of new track, extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking. The addition of a second track over the Harlem River at the Spuyten-Duyvil Railroad Bridge (MP 10) for the above improvements could have waterway impacts. The alignment in these improvement areas would also closely adjoin the Hudson River; however, work would likely remain within the existing right-of-way and would be unlikely to impact the Hudson River waterway.

With Alternative 90A, signal improvements proposed along 43 miles (MPs 32.8 to 75.8) would cross the Hudson River at two U.S. Coast Guard permitted bridges: one over Croton Bay (MPs 32.5 to 33) and the other over Peekskill Bay (MP 42). Even though work on the bridges would be minimal and likely contained within the existing right-of-way, it could have waterway impacts. In addition, the alignment in these improvement areas also closely adjoins the Hudson River; however, work would likely remain within the existing right-of-way and would be unlikely to impact the Hudson River waterway. The 10 miles of new third track (MPs 53 to 63) and improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) would be unlikely to impact navigable waters.

North of Poughkeepsie and south of Albany-Rensselaer Station (MPs 75.8 to 140), proposed improvements would include rock slope stabilization (MPs 105 to 130), three new control points (CP 82, CP 99, and CP 136), as well as station improvements at Rhinecliff Station (high-level platforms) and Hudson Station (new Ferry Street Bridge and track realignments). It is anticipated that these improvements would occur largely within the right-of-way and impacts to navigable waters would not be anticipated. Alternative 90A also includes replacement of the Livingston Avenue Bridge, which would pass over the Hudson River and has been permitted by the U.S. Coast Guard. Improvements and replacement activities could result in permanent and temporary waterway impacts, depending on the design.

Empire Corridor West/Niagara Branch

This entire 10-mile segment would closely adjoin the banks of the Mohawk River; however, impacts in these areas would be contained within the current right-of-way, and there would be little potential to impact the Mohawk River.

Upgrades to interlockings and automatic block signals would also occur at three control points in the Cities of Amsterdam, Utica, and Rome (CP 175, CP 239, and CP 248, respectively) and Amsterdam Station improvements (MP 177.6). The control points and station improvements would be located within the boundaries of the principal aquifer, which would generally underlie the Mohawk River. These improvements would occur close to the banks of the Mohawk River; however, impacts in these areas would be contained within the current right-of-way, and there would be little potential to impact the Mohawk River. Alternative 90A would also include Syracuse track improvements of upgrading interlocking, automatic block signals, and control points and track improvements at the Syracuse Station (MPs 290 to 294). These improvements would involve the crossing of the Erie Canal and could also result in permanent and temporary impacts.

Rochester third track improvements along nine miles (MPs 373 to 382), west of the Rochester

Station, would involve a crossing of the Erie Canal (MP 374.5). Improvements and construction activities at this crossing could result in permanent and temporary waterway impacts. Alternative 90A also would include the addition of a third track along 11 miles (MPs 382 to 393) in western Monroe and eastern Genesee Counties, which would not be anticipated to impact navigable waters.

Station improvements at the Buffalo-Depew Station (MPs 429.5 to 432.5) and the proposed double track (MPs QDN17 to QDN23.2) would not cross navigable waters.

7.2.3 Alternative 110

Empire Corridor South

No additional work within Empire Corridor South, other than that described above for Alternative 90A, is proposed.

Empire Corridor West/Niagara Branch

Third and fourth track improvements for Alternative 110 would start at MP 160 in the City of Schenectady, and extend west to MP 430, east of Buffalo. Third and fourth track improvements would impact five navigable waters at 11 crossings in Schenectady, Herkimer, Oneida, Onondaga, Wayne, Monroe, and Erie Counties. These are the same crossings as described in Alternatives 90A and 90B. No other impacts other than those described above for Alternatives 90A and 90B would be anticipated.

7.2.4 Alternative 125

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River (MP 143.4). Proposed improvements would cross the Hudson River and construction of a new bridge over the Hudson River would also result in temporary and permanent impacts and would require permitting by the U.S. ACE and the USCG.

Empire Corridor West/Niagara Branch

The new Alternative 125 alignment would cross the Erie Canal (MP QH278.5) in Syracuse, as well as the Genesee River (MP QH356.75) and the Erie Canal (MP QH359) near Rochester. Track improvements at these crossings could result in permanent and temporary impacts as described above, and may require clearance and permitting by the U.S. ACE and the USCG. In addition to the above three crossings, Alternative 125 would also cross Ellicott Creek (MP QH411.5) before converging with the existing Empire Corridor east of Buffalo. Work over or within Ellicott Creek could result in permanent and temporary impacts.

8. Floodplains

8.1 Existing Conditions

8.1.1 Empire Corridor South

The Empire Corridor South, from New York City to Rensselaer, extends 142 miles and in many locations closely follows the east bank of the Hudson River. All of the Build Alternatives follow the existing Empire Corridor South for the majority of its length, deviating only in Rensselaer County, where the 125 Study Area splits off 1.6 miles south of where the existing Empire Corridor (the 90/110 Study Area) turns to the west. This corridor segment includes the study area counties of New York County (Manhattan Borough), Bronx County, Westchester County, Putnam County, Dutchess County, Columbia County, and Rensselaer County. The entire corridor in this segment is located in the Lower Hudson River Watershed.

The rail corridor extends approximately 10.3 miles north through **Manhattan (New York County)** from its southern terminus, daylighting from a rail tunnel just north of Milepost 5. The Hudson River is generally within 150 to 300 feet of the western side of the railroad for the majority of the county and floodplains associated with the Hudson River are located within 300 feet of the rail centerline.

After crossing the Harlem River, the railroad enters and extends through **Bronx County** after crossing the Harlem River for a distance of approximately 2.6 miles. There are no waterway crossings in Bronx County; however, the corridor closely adjoins the west bank of the Hudson River throughout the county and approximately 179 acres of mapped 100-year floodplains are located within 300 feet of the railroad centerline.

The railroad continues to closely adjoin the Hudson River through 31.5 miles of the rail corridor as it extends through **Westchester County**, largely remaining within 50 to 500 feet of the river. There are approximately 703 acres of mapped 100-year floodplains within 300 feet of the rail centerline, associated with the Hudson River and its tributaries (encountered at 23 waterway crossings) in this county.

The railroad traverses through 9.3 miles of **Putnam County**, largely remaining within 50 to 500 feet of the Hudson River. The majority of the rail corridor remains in close proximity to the Hudson River, with the exception of a 1-mile section south of Cold Springs (MPs 51 to 52). There are approximately 12 waterway crossings in this county, including several bridges over the inlets and coves of the Hudson River (MPs 51, 52 [Foundry Cove], and 53). There are approximately 340 acres of mapped 100-year floodplains within 300 feet of the railroad centerline associated with the Hudson River and its tributaries.

The rail corridor traverses approximately 45.6 miles across **Dutchess County**. The majority of the railroad is within 50 to 300 feet of the Hudson River and crosses several coves and inlets of the river as it passes through the county. There are approximately 1,766 acres of 100-year floodplains mapped within 300 feet of the rail centerline associated with the Hudson River and the roughly 38 waterway crossings in this county.

The rail corridor continues to closely adjoin the Hudson River through the majority of the 29.5 miles of the rail corridor as it extends through **Columbia County**, largely remaining within 50 to 300 feet of the river. There are approximately 22 waterway crossings in this county, including several bridges

over the inlets of the Hudson River. Approximately 1,244 acres of 100-year floodplains are located within 300 feet of the rail centerline in this county associated with the Hudson River and its numerous tributaries.

The railroad extends 13.4 miles through **Rensselaer County**, paralleling the Hudson River and closely adjoining the river through the southern portion of the county. In the 90/110 Study Area, there are roughly 751 acres of 100-year floodplains. In the 125 Study Area, there are 752 acres of 100-year floodplains. These floodplains are primarily associated with the Hudson River.

8.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

The 322-mile-long Empire Corridor West/Niagara Branch for the 90/110 Study Area, with the exception of the metropolitan areas within and surrounding the major cities, has a distinctively more rural agricultural character than the segment to the south. The Empire Corridor West generally follows or parallels several geographic features, including the Mohawk River or New York Canal System, and the New York State Thruway. The Niagara Branch turns north at Buffalo on Lake Erie, generally paralleling the Lake Erie shoreline and then extending north along the Niagara River.

The railroad crosses over the Hudson River (MP 143) at the Livingston Avenue Bridge and enters **Albany County**. The railroad extends approximately 11.8 miles across Albany County. The 600-foot-wide study area in this county contains approximately 90 acres of 100-year floodplains associated with the Hudson River and other crossing waterways, including Patroons Creek, Rensselaer Lake, and Lisha Kill. The southeastern portion of Albany County is within the Lower Hudson River watershed, but just after the railroad crosses Rensselaer Lake (MP 154), there is a transition to Mohawk River watershed.

The entire 14.7 miles of the Empire Corridor that pass through **Schenectady County** are located within the Mohawk River watershed. There are approximately nine waterway crossings in Schenectady County, including the Mohawk/Erie Canal that parallels the railroad west of Schenectady Station, extending between 75 feet to 1 ¼ miles of the railroad. There are approximately 179 acres of 100-year floodplains within 300 feet of the rail centerline.

The railroad continues to closely adjoin the north banks of the Mohawk River/Erie Canal through the 40.3 miles of the rail corridor as it extends through **Montgomery County**, largely remaining within 50 to 1,000 feet of the river/canal. The entire county remains within the Mohawk River watershed, and there are approximately 35 waterway crossings in this county. There are approximately 7 acres of 100-year floodplains within 300 feet of the railroad.

The railroad traverses through **Herkimer County** for approximately 25.3 miles. There are approximately 904 acres of 100-year floodplains within 300 feet of the rail centerline. The floodplains are associated with the Mohawk River/ Erie Canal, which parallel the railroad throughout the county.

The Empire Corridor extends 28.6 miles through **Oneida County**, paralleling the Erie Canal through the eastern half of the county between Utica on the east and Rome. The eastern half of the county remains within the Mohawk River watershed, but west of the Rome Station (MP 261.5) the railroad enters the Oswego River/Finger Lakes watershed. There are approximately 780 acres of mapped 100-year floodplains within the study area. These floodplains are associated with certain

waterbodies that cross the railroad in Oneida County (11 in total), including the Mohawk River, Mud Creek, Stony Creek, and Oneida Creek.

Madison County is entirely within the Oswego River/Finger Lakes watershed, and the railroad traverses through approximately 13.8 miles of this county. In the eastern half of the county, the railroad generally parallels the Old Erie Canal, with the canal within 100 to 1,000 feet on the north side, before it crosses the railroad around MP 272 and heads south, out of the study area. There are approximately 226 acres of 100-year floodplains within 300 feet of the rail centerline. These floodplains are associated with certain waterbodies that cross the railroad in Madison County (11 in total), including Old Erie Canal, Cowelson Creek, Canastota Creek, Owlville Creek, and Canseraga Creek.

The railroad extends 31.3 miles through **Onondaga County**, roughly paralleling the New York State Thruway and skirting the southeast shores of Onondaga Lake in the city of Syracuse. There are approximately 712 acres of 100-year floodplains in the study area associated with certain waterway crossings in this county (16 in all). Floodplains adjoin Pools Brook, Lake Brook, Limestone Creek, Butternut Creek, Onondaga Lake itself and its tributaries (Ley Creek, Geddes Brook, Ninemile Creek), and Old Erie Canal. All waters are within the Oswego River/Finger Lakes watershed in this county.

The Empire Corridor extends 11.5 miles through **Cayuga County**, roughly paralleling the New York State Thruway. There are 316 acres of 100-year floodplains mapped in the study area in this county. These floodplains are associated with the five water body crossings: the Seneca River (which crosses the railroad at the west end of the county) and its tributaries Putnam Brook, Coldspring Brook, Owasco Outlet, and Swamp Brook.

The railroad extends 37.1 miles through rural **Wayne County**, paralleling portions of the Erie Canal and Route 31. The Erie Canal meanders back and forth along the railroad for much of the county, crossing the railroad twice. Most (98%) of the railroad is located within the Oswego River/Finger Lakes watershed, and the railroad enters the Lake Ontario Tributaries watershed (MP 357) on the western end. There are approximately 18 waterway crossings in this county, including the two Erie Canal crossings mentioned above, and approximately 720 acres of 100-year floodplains within the study area.

The railroad extends 30.9 miles through **Monroe County**, closely paralleling the Erie Canal from the county's eastern border to just west of the town of Fairport (MP 361.5). The canal extends close to the study area west of Rochester. The county remains in the Lake Ontario Tributaries watershed until just east of Rochester where the railroad enters the Genesee River watershed (MP 370.5), just before crossing the Genesee River (MP 371.5). There are approximately 237 acres of 100-year floodplains associated with the certain waterway crossings within the study area (19 in all), including the Erie Canal and Genesee River.

The railroad traverses approximately 30 miles through **Genesee County**, and generally follows Route 33. The railroad remains in the Genesee River watershed through the eastern portion of the county and passes into the Niagara River/Lake Erie watershed just before the town of Batavia (MP 401). There are 234 acres of 100-year floodplains within the study area associated with certain waterway crossings in the county (17 in total), including Black Creek and Tonawanda Creek, and Murder Creek.

The rail corridor extends 32.7 miles through **Erie County**. The Niagara River/Lake Erie watershed is the only watershed the railroad traverses in this county. There are approximately 15 acres of 100-

year floodplains within the study area associated with waterway crossings in this county, including Ellicot Creek, Scajaquada Creek, and Erie Canal.

The railroad extends 14.4 miles through **Niagara County**, to the north of Erie County. The Niagara River/Lake Erie watershed is the only watershed the rail corridor traverses in this county. There are approximately 22 acres of 100-year floodplains within the study area associated with waterway crossings, including Sawyer Creek, Bergholtz Creek, Cayuga Creek, and Gill Creek.

8.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

The 125 Study Area crosses over the Hudson River (MP QH143.5) and enters **Albany County**. Currently, there is not an existing bridge structure that supports this alignment over the Hudson River. The corridor extends approximately 14 miles across Albany County. The 600-foot-wide study area in this county contains approximately 43 acres of 100-year floodplains associated with the Hudson River and other crossing waterways, including Krum Kill. This portion of Albany County is within the Lower Hudson River watershed.

The corridor extends 17 miles through **Schenectady County** and remains in the Lower Hudson River watershed for approximately 1.5 miles before crossing into the Mohawk River watershed. It then passes back into the Lower Hudson River watershed for a majority of the county before heading back into the Mohawk River watershed, just before MP QH171. The remainder of the county remains in the Mohawk River watershed. There are approximately 18 waterway crossings in Schenectady County, including Bonny Brook and numerous small tributaries to Norman's Kill to the south. There are approximately 40 acres of 100-year floodplains within 300 feet of the rail centerline.

The corridor remains in the Mohawk River watershed throughout the 6.5 miles in **Schoharie County**. The corridor would have approximately nine waterway crossings, including Schoharie Creek and several crossings of Fly Creek, and approximately 131 acres of 100-year floodplains lie within 300 feet of the rail centerline. The corridor continues within the Mohawk River watershed through 21.3 miles as it extends through **Montgomery County**. There are approximately 21 waterway crossings in this county, including Fly Creek, Flat Creek and Canajoharie Creek. There are no 100-year floodplains within 300 feet of the rail centerline.

The corridor then traverses through **Herkimer County** for approximately 25.3 miles. There are approximately 45 acres of 100-year floodplains within 300 feet of the rail centerline. The floodplains are associated with crossings of Otsquago Creek, Ohisha Creek, Fulmer Creek and numerous smaller tributaries.

The 125 Study Area extends 22 miles through **Oneida County**, remaining in the Mohawk River watershed in the eastern half of the county before entering into the Oswego River/Finger Lakes watershed at approximately MP QH243.5. There are approximately 81 acres of mapped 100-year floodplains within the study area. These floodplains are associated with certain waterbodies that cross the proposed centerline in Oneida County (18 in total), including Palmer Creek, Sauquoit Creek, Mud Creek, Sherman Brook, Oriskany Creek and Sconondoa Creek.

Madison County is entirely within the Oswego River/Finger Lakes watershed, and the corridor traverses through approximately 14.6 miles of this county. There are approximately 110 acres of 100-year floodplains within 300 feet of the proposed centerline. These floodplains are associated with certain waterbodies that cross the corridor in Madison County (20 in total), including Oneida

Creek, Cowelson Creek, Dutch Settlement Creek, Canastota Creek, Owlville Creek, Canaseraga Creek, Old Erie Canal and Chittenango Creek.

The corridor extends 31.6 miles through **Onondaga County**, roughly paralleling the New York State Thruway and skirting the southeast shores of Onondaga Lake in the city of Syracuse. There are approximately 547 acres of 100-year floodplains in the study area associated with certain waterway crossings in this county (20 in all). Floodplains adjoin Pools Brook, Lake Brook, Limestone Creek, Butternut Creek, Onondaga Lake itself and its tributaries (Ley Creek, Geddes Brook, Ninemile Creek), Deadman Creek and Old Erie Canal. All waters are within the Oswego River/Finger Lakes watershed in this county.

The 125 Study Area extends 11.1 miles through **Cayuga County** and remains in the Oswego River/Finger Lakes watershed. There are approximately 45 acres of 100-year floodplains mapped in the study area in this county. These floodplains are associated with the 15 water body crossings: the Seneca River (which crosses the railroad at the east end of the county) and its tributaries, Muskrat Creek and Spring Lake Outlet.

The corridor extends 35.5 miles through rural **Wayne County**, primarily remaining within the Oswego River/Finger Lakes watershed, with a small portion in the eastern portion of the county crossing into the Lake Ontario Tributaries watershed before crossing back to Oswego River/Finger Lakes watershed. There are approximately 43 waterway crossings in this county and approximately 8 acres of 100-year floodplains within the study area associated with stream crossings in the City of Rose.

The corridor extends 29.5 miles through **Monroe County**. The county remains in the Lake Ontario Tributaries watershed until just east of Rochester where the railroad enters the Genesee River watershed, just before crossing the Genesee River (MP QH356). There are approximately 296 acres of 100-year floodplains associated with the certain waterway crossings within the study area (23 in all), including Thomas Creek, Irondequoit Creek, Allen Creek, Erie Canal, Genesee River and Little Black Creek.

The 125 Study Area traverses approximately 29.7 miles through **Genesee County**, and crosses the Genesee River watershed, Lake Ontario Tributaries watershed and the Niagara River/Lake Erie watershed east to west. There are approximately 247 acres of 100-year floodplains within the study area associated with certain waterway crossing in the county (25 in total), including Black Creek, Oak Orchard Creek, Whitney Creek, Tonawanda Creek and Murder Creek.

The rail corridor extends 24.3 miles through **Erie County**. The Niagara River/Lake Erie watershed is the only watershed the railroad traverses in this county. There are approximately 20 acres of 100-year floodplains within the study area associated with waterway crossings in this county, including Ransom Creek, Ellicot Creek, Scajaquada Creek, and Erie Canal.

The railroad corridor extends 14.4 miles through **Niagara County**, to the north of Erie County. The Niagara River/Lake Erie watershed is the only watershed the rail corridor traverses in this county. There are approximately 22 acres of 100-year floodplains within the study area associated with waterway crossings, including Sawyer Creek, Bergholtz Creek, Cayuga Creek, and Gill Creek.

8.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.9). The potential impacts of the Base Alternative and the other Build Alternatives are described in more detail below. Because the extent to which these alternatives will involve encroachments and fill that may increase flood hazards is not yet known, the assessment identified the potential for impacts. The discussion below identifies the locations where the various alternatives considered may incur work within or proximal to floodplains and potentially involve impacts on floodplains.

8.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies. The Tier 1 Draft EIS addressed the potential impacts of the eight projects on floodplains.

8.2.2 Alternative 90A

Empire Corridor South

Alternative 90A would include construction of four miles of second track through urbanized areas of Manhattan (MPs 9 to 13), and 1.4 miles (MPs 23.8 to 25.2) of new track, extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking. Both projects would encroach on floodplains associated with the Hudson River and minor tributaries, such as the Harlem River at MP 10.

With Alternative 90A, signal improvements proposed along 43 miles (MPs 32.8 and 75.8) would extend through floodplain areas (primarily associated with the Hudson River and its tributaries to the east). However, work could be contained within the right-of-way and minimal impacts to floodplains are expected from the signal improvements. Along this section, portions of the 10 miles of new third track (MPs 53 to 63) and improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) would be located within mapped floodplains associated with the Hudson River and its tributaries such as Breakneck Brook, Catskill Aqueduct, Cascade Brook, Gordons Brook and Fishkill Creek.

North of Poughkeepsie and south of Albany-Rensselaer Station (MPs 75.8 to 140), proposed improvements would include rock slope stabilization (MPs 105 to 130) and three new control points (CP 82, CP 99, and CP 136), as well as station improvements at Rhinecliff Station (high-level platforms) and Hudson Station (new Ferry Street Bridge and track realignments). Much of the railroad alignment in this area would pass through Hudson River floodplains and floodplains of tributaries east of the Hudson River, but some of these improvements that are at-grade may have a minimal impact on flooding characteristics. Alternative 90A would also include replacement of the Livingston Avenue Bridge, which would pass over the Hudson River and its floodplain at the Rensselaer/Albany County Line.

Empire Corridor West/Niagara Branch

With Alternative 90A, track improvements would include 10 miles of third track between MPs 169 and 179, and Amsterdam Station improvements along the west end of this segment. This entire 10 mile segment would closely adjoin the banks of the Mohawk River through Schenectady and Montgomery counties. There are no floodplains located along the track between these mileposts. Although impacts in these areas may be contained within the current right-of-way, there would still be potential for minimal encroachment on floodplains in these areas.

West of MP 175, the railroad alignment would continue to closely adjoin the banks of the Mohawk River and Erie Canal through MP 253. Floodplains associated with the Mohawk River and the Erie Canal, as well as numerous tributaries would be located along the track. In Montgomery County, the alignment crosses associated floodplains between MP200 and MP202. From MPs 253 to 295, the alignment would cross numerous waterways and their associated floodplains. Since this work would be performed within the current right-of-way, it would be unlikely to impact the floodplain through this segment.

In the area of the Syracuse Station track improvements, the alternative would pass through floodplains associated with Ley Creek (MP 287), the Erie Canal and Onondaga Lake (MPs 292.5 to 292.75).

Rochester third track improvements are proposed along nine miles (MPs 373 to 382) west of Rochester Station. These third track improvements could have the potential to impact floodplains associated with the Erie Canal (MP 374.5) and Little Black Creek (MPs 377.5 to 378.5).

Alternative 90A would also include the addition of a third track along 11 miles (MPs 382 to 393) in western Monroe and eastern Genesee Counties. The addition of this track will encroach on floodplains associated with Little Black Creek, Robins Brook and Black Creek.

The proposed double track (MPs QDN17 to QDN23.2) could have the potential to impact floodplains associated with Bergholtz Creek (MP QDN20) and Cayuga Creek (MP QDN21.5).

8.2.3 Alternative 110

With Alternative 110, Empire Service would match the increased frequency of service for Alternative 90B and would provide further improvements in travel times, with 273 miles of exclusive third track between Schenectady and Buffalo. This track would be further offset 30 feet, and additional infrastructure improvements included, to accommodate higher speeds. Alternative 110 would also add 59 miles of fourth track in six locations.

Empire Corridor South

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, would occur and additional floodplain impacts would not be anticipated.

Empire Corridor West/Niagara Branch

With Alternative 110, track realignments and third and fourth track improvements would traverse the same floodplain areas as described in Alternatives 90A and 90B (with the exception of Scajaquada

Creek [MP QDN6.3] in Erie County), but may have greater impacts as the tracks are further offset from the existing tracks. No other floodplain encroachments other than those described above for Alternatives 90A and 90B would be anticipated for Alternative 110.

8.2.4 Alternative 125

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. Proposed improvements would have the potential to encroach on floodplains associated with Mill Creek and the Hudson River over this one-mile segment.

Empire Corridor West/Niagara Branch

After crossing the Hudson River, Alternative 125 would extend through Albany and Schenectady Counties over a distance of 20 miles, primarily following the New York State Thruway (I-87/I-90) over most of this distance. In Albany County, Alternative 125 would have the potential to impact floodplains associated with the Hudson River (MPs QH143 to QH144) and Krum Kill (MP QH147.75). In Schenectady and Schoharie Counties, Alternative 125 would cross approximately 27 waterways. Floodplains exist along these waterways in Schenectady County between MPs QH161 and QH162, associated with Watervliet Reservoir, and at MP QH174, associated with Schoharie Creek. It is likely that construction of Alternative 125 would have the potential to impact these floodplains. In addition, impacts to floodplains from Alternative 90A would also occur in Schenectady County as part of Alternative 125.

Alternative 125 would extend through Montgomery County, where there are approximately 21 waterway crossings, including Fly Creek, Flat Creek, Canajoharie Creek and numerous unnamed tributaries. No floodplains exist along Alternative 125 in Montgomery County. However, impacts to floodplains from Alternative 90A would also occur in Montgomery County as part of Alternative 125.

In Herkimer County, Alternative 125 would cross approximately 39 waterways and floodplains associated with Otsquago Creek (MP QH202.5), Ohisha Creek (MP QH206.5), Fulmer Creek (MP QH212), Steele Creek (MP QH218) and an unnamed tributary to Moyer Creek (MP QH221.5).

In Oneida County, Alternative 125 would extend through primarily rural areas and would cross approximately 18 mapped waterways, including floodplains associated with Palmer Creek (MP QH229.5), Sauquoit Creek (MP QH230.25), Sherman Brook and Oriskany Creek (MPs QH235.5 to QH236), Dean's Creek (MP QH240), and Sconondoa Creek (MP QH248). Alternative 125 would enter the floodplain of Oneida Creek as it crosses into Madison County.

In Madison County, Alternative 125 would extend through primarily rural areas and would cross floodplains associated with Oneida Creek (MP QH249.5), Cowelson Creek (MP QH253), an unnamed tributary to the Erie Canal (MP QH253.5), Canastota Creek, Owlville Creek and its tributaries (MPs QH257.75 and QH258.25), Canaseraga Creek (MP QH260), and Chittenango Creek MP QH262.25).

In Onondaga County, there would be approximately 20 waterway crossings. The alignment would cross floodplains associated with Pools Brook (MP QH264.75) and would be within, or adjacent to,

floodplains associated with Lake Brook and Limestone Creek for approximately two miles (MPs QH266.25 to QH268.25) just before rejoining the existing Empire Corridor. The alternative would then cross floodplains associated with Butternut Creek (MP QH270.5) and Ley Creek (MP QH272.75) in East Syracuse, before crossing floodplains associated with the Erie Canal and Onondaga Lake for roughly two miles (MPs QH276.5 to QH279.5) through the City of Syracuse. Just east of Syracuse, the alignment would be in, or adjacent to, floodplains associated with Geddes Brook and Nine Mile Creek for roughly two-and-a-half miles (MPs QH281.75 to QH284) before splitting from the exiting Empire Corridor. The alignment would pass through areas of floodplains associated with Dead Man Creek (MP QH289.75), the Seneca River and Cross Lake (MP QH292), in the western portion of the county.

In Cayuga County, Alternative 125 would cross three floodplain areas associated with the Seneca River (MP QH295.75), Muskrat Creek (MP QH297.5) and a tributary of the Seneca River (MP QH304).

In Wayne County, Alternative 125 would cross approximately 43 waterways. Alternative 125 would also cross a floodplain associated with Sodus Creek (QH316 to QH317).

In Monroe County, Alternative 125 would cross floodplains associated with Thomas Creek and several of its tributaries (MPs QH343.5 and QH345.5 to QH346.5), Irondequoit Creek (MP QH347.5), Allen Creek (MP QH350.25), the Genesee River (MP QH356.25) and the Erie Canal (MP QH359). Also, just after the alignment diverges from the existing Empire Corridor east of Rochester, Alternative 125 would pass in and out of the Little Black Creek floodplain for approximately four miles (MPs QH361.5 to QH365.5).

In Genesee County, Alternative 125 would extend through primarily rural areas and cross approximately 25 mapped waterways. The alignment would cross floodplains associated with Black Creek and its tributaries (MPs QH372.25, QH373.25, QH374.25 and QH375.75 to QH377), unnamed tributaries to Spring Creek (MPs QH382 to QH383), Oak Orchard Creek and its tributaries (MPs QH383.5, QH385, QH385.5, QH386 and QH388), Tonawanda Creek (MP QH397.5) and Murder Creek and its tributaries (MPs QH400.5 to QH401.25).

Alternative 125 would cross floodplains associated with Ellicott Creek (MP QH411.5) in Erie County. No impacts to floodplains would occur from Alternative 125 in Niagara County other than those described in Alternative 90A.

9. Wetlands

9.1 Existing Conditions

The following sections review the federal and state wetlands classifications for the study area. The U.S. Fish and Wildlife Classification System defines five major wetland and deepwater systems: marine, estuarine, riverine, palustrine (non-tidal freshwater or salinities less than 0.5 parts per thousand), and lacustrine. The state classifications for tidal and freshwater wetlands are shown in Exhibit G-10 and Exhibit G-11.

- **Estuarine Deepwater** (specific classes of estuarine subtidal unconsolidated bottom), comprising 16 percent of NWI wetlands along the 90/110 Study Area and 20 percent along the 125 Study Area;
- **Estuarine Wetlands** (specific classes of estuarine intertidal unconsolidated shore/emergent) comprising 1 percent of NWI wetlands along both the existing Empire Corridor (90/110 Study

Area) and 2 percent along the 125 Study Area;

- **Riverine** (associated with rivers, including riverine intertidal upper/lower perennial and two occurrences of riverine intermittent), comprising 29 percent of NWI wetlands along both the existing Empire Corridor (90/110 Study Area) and the 125 Study Area;
- **Freshwater (or Palustrine) Emergent Wetlands**, comprising 14 percent of NWI wetlands along the existing Empire Corridor (90/110 Study Area) and 9 percent along the 125 Study Area;
- **Freshwater Forested/Shrub Wetland** (including specific classes of palustrine scrub shrub/forested), comprising 34 percent of NWI wetlands along the existing Empire Corridor (90/110 Study Area) and 35 percent along the 125 Study Area;
- **Freshwater Pond**, comprising 4 percent of NWI wetlands along both the existing Empire Corridor (90/110 Study Area) and the 125 Study Area;
- **Lakes** (larger than ponds, specific classes of lacustrine limnetic/littoral unconsolidated bottom), comprising 2 percent of NWI wetlands along both the existing Empire Corridor (90/110 Study Area) and the 125 Study Area.

The NYSDEC tidal wetland categories mapped in the Empire Corridor include open water (26% of tidal wetlands); broad-leaf vegetation (3%); graminoid vegetation (5%); coastal shoals, bars, and mudflats (1%); vegetated coastal shoals, bars, and mudflats (1%); swamp shrub (1%); and swamp tree (2%). The tidal wetland percentages for the 90/110 and the 125 Study Areas are the same, although the mapped Adjacent Areas to Tidal Wetlands differ. The 90/110 Study Area had approximately 5,550 acres of mapped Adjacent Areas to Tidal Wetlands. The 125 Study Area had less mapped Adjacent Areas to Tidal Wetlands at 5,458 acres.

In the existing Empire Corridor (90/110 Study area), NYSDEC freshwater wetlands include the highest value wetlands, Class I, which comprises 40 percent of total NYSDEC freshwater wetlands. Class II wetlands comprise 55 percent of NYSDEC freshwater wetlands in the study area, compared to Class III (3%), and Class IV (2%) of total freshwater wetlands in the study area counties.

In the 125 Study Area, NYSDEC freshwater wetlands include the highest value wetlands, Class I, which comprises 54 percent of total NYSDEC freshwater wetlands. Class II wetlands comprise 32 percent of NYSDEC freshwater wetlands in the study area, compared to Class III (13%), and Class IV (less than 1%) of total freshwater wetlands in the study area counties.

9.1.1 Empire Corridor South

Wetlands in the 600-foot-wide study area along Empire Corridor South are primarily associated with the Hudson River. The study area includes approximately 56 acres of mapped NWI wetlands in **New York County (Manhattan)** and 21 acres in **Bronx County**. In both New York and Bronx counties, all NWI wetlands are classified as estuarine deepwater.

Exhibit G-10—NYSDEC Tidal Wetland Classifications in the Study Area

Tidal Wetland Class	Description
Open Water (OW)-	Open water areas
Coastal Shoals, Bars and Mudflats (SM)	The tidal wetland zone that at high tide is covered by saline or fresh tidal waters, at low tide is exposed or is covered by water to a maximum depth of approximately one foot, and is not vegetated.
Vegetated Coastal Shoals, Bars and Mudflats (SV)	The tidal wetland zone that at high tide is covered by saline or fresh tidal waters, at low tide is exposed or is covered by water to a maximum depth of approximately one foot, and is vegetated.
Broad-Leaf Vegetation (BV)	The vegetated tidal wetlands zone that includes all lands that generally receive daily flushing from fresh tidal water. This area is generally lower than the graminoid vegetation area and is characterized by broad leaf emergent vegetation such as spatterdock, <i>Nuphar sp.</i> , pickerelweed (<i>Pontederia cordata</i>) and arrowleaf, (<i>Peltandra virginica</i>) among others.
Graminoid Vegetation (GV)	The vegetated tidal wetlands zone that includes all lands that receive at least periodic flushing from fresh water. This area is generally higher than the broad leaf vegetation area. The lower elevated portions of this area may receive daily flushing and the higher elevations periodic flushing from storm tides. It is characterized by graminoid vegetation such as cattail (<i>Typha angustifolia</i>), bulrushes, (<i>Scirpus spp.</i>) and wild rice, <i>Zizania aquatica</i> .
Swamp Shrub (SS)	The swamp shrub zone includes all land that receives periodic inundation from tidal fresh waters and is characterized by shrubs such as alder (<i>Alnus spp.</i>), buttonbush (<i>Cephalanthus occidentalis</i>) bog rosemary (<i>Andromeda glaucophylla</i>), dogwoods (<i>Cornus spp.</i>) and leatherleaf (<i>Chamaedaphne calyculata</i>).
Swamp Tree (ST)	The swamp tree zone includes all land that receives periodic inundation from tidal fresh waters and is characterized by trees such as red maple (<i>Acer rubrum</i>), willows (<i>Salix spp.</i>) and black ash (<i>Fraxinus nigra</i>).

Exhibit G-11—NYSDEC Freshwater Wetland Classifications¹

Freshwater Wetland Class	Description
Class I	If it has any one of following seven characteristics: (1) kettlehole bog, (2) resident habitat for endangered or threatened animal species or (3) supports other animal species unusual for the state or region or (4) contains endangered or threatened plant species, (5) provides protection to developed area from significant flood damage, or (6) tributary to surface water or aquifer used for public water supply, or (7) contains four or more Class II characteristics.
Class II	If it has any one of following seventeen characteristics: (1) emergent marsh covered in which cover type is less than two-thirds purple loosestrife and/or reed (phragmites), (2) contains two or more wetland structural groups, (3) contiguous to a tidal wetland, (4) associated with permanent open water outside the wetland, (5) adjacent or contiguous to streams classified C(t) or higher under article 15 of the environmental conservation law, (6) traditional migration habitat of an endangered or threatened animal species, (7) resident habitat of an animal species vulnerable in the state, (8) contains a plant species vulnerable in the state, (9) supports an animal species in abundance or diversity unusual for the county in which it is found, (10) has demonstrable archaeological or paleontological significance as a wetland, (11) contains, is part of, owes its existence to, or is ecologically associated with, an unusual geological feature, which is an excellent representation of its type, (12) provide protection from significant flood damage to lightly developed area, an area used for growing crops for harvest, or an area planned for development by a local planning authority, (13) hydraulically connected to an aquifer identified by a government agency as a potentially useful water supply, (14) acts in a tertiary treatment capacity for a sewage disposal system, (15) within an urbanized area, (16) one of the three largest wetlands within a city, town, or New York City borough, or (17) within a publicly owned recreation area.
Class III	If it has any one of following fifteen characteristics: (1) emergent marsh in which purple loosestrife and/or reed (phragmites) constitutes two-thirds or more of the cover type, (2) deciduous swamp, (3) shrub swamp, (4) consists of floating and/or submergent vegetation, (5) consists of wetland open water, (6) contains an island with an area or height above the wetland adequate to provide one or more of the benefits described in section 664.6(b)(6);(7) has a total alkalinity of at least 50 parts per million, (8) is adjacent to fertile upland, (9) resident habitat of an animal species vulnerable in the major region of the state in which it is found, or it is traditional migration habitat of an animal species vulnerable in the state or in the major region in which it is found, (10) contains a plant species vulnerable in the major region, (11) part of a surface water system with permanent open water and it receives significant pollution of a type amenable to amelioration by wetlands, (12) visible from an interstate highway, a parkway, a designated scenic highway, or a passenger railroad and serves a valuable aesthetic or open space function, (13) one of the three largest wetlands of the same cover type within a town, (14) in a town in which wetland acreage is less than one percent of the total acreage or (15) is on publicly owned land that is open to the public.
Class IV	If it does not have any of the characteristics listed as criteria for Class I, II or III wetlands. Class IV wetlands will include wet meadows and coniferous swamps, which lack other characteristics justifying a higher classification.

¹ NYSDEC, "Environmental Conservation Law §3-0301 and §24-1301, Chapter X-Division of Water, Part 664 Freshwater Wetlands Maps and Classification." Accessed April 18, 2011. <http://www.dec.ny.gov/regs/4612.html#13474>

In **Westchester County**, the study area includes a total 634 acres of mapped wetlands within 300 feet of the railroad centerline. This includes 150 acres mapped of NWI wetlands, 424 acres of NWI and NYSDEC tidal wetlands, and 60 acres of NYSDEC tidal wetlands. NWI wetlands include 91 percent of estuarine deepwater and 1 percent of estuarine wetland. NYSDEC tidal wetlands include approximately 68 percent open water and 4 percent gramminoid vegetation. In addition, there are 1,018 acres of adjacent areas of tidal wetlands mapped. NYSDEC freshwater wetlands include approximately 64 percent of Class I wetlands and 36 percent of Class II Wetlands.

In **Putnam County**, there are a total of 289 acres of wetlands mapped in the study area. Of the 289 acres, 211 acres are NWI and NYSDEC tidal wetlands and 46 acres are NYSDEC tidal wetlands. NWI wetlands include: 71 percent of estuarine deepwater, 19 percent of estuarine wetland, and 9 percent of palustrine forested/shrub or emergent wetlands. NYSDEC tidal wetlands include approximately 70 percent open water and 24 percent gramminoid vegetation wetlands. In addition, there are a total of 386 acres of adjacent areas to tidal wetlands mapped. NYSDEC freshwater wetlands include approximately 43 percent of Class I wetlands and 57 percent of Class II wetlands.

In **Dutchess County**, the study area passes through a total of 1,312 acres of mapped wetlands. This includes 1,017 acres of NWI and NYSDEC tidal wetlands, 185 acres of NWI and NYSDEC tidal/freshwater wetlands, and 104 acres of NYSDEC tidal wetlands. NWI wetlands include: 49 percent riverine, 2 percent estuarine wetlands, 10 percent palustrine emergent wetland or forested/shrub wetlands, 4 percent of ponds, and 6 percent of lakes. NYSDEC tidal wetlands include approximately 79 percent of open water, 8 percent of broad-leaf vegetation, and 9 percent of gramminoid vegetation. In addition, there are a total of 1,995 acres of adjacent areas to tidal wetlands mapped. NYSDEC freshwater wetlands include approximately 71 percent of Class I wetlands and 29 percent of Class II wetlands.

In **Columbia County**, the study area includes a total of 966 acres of mapped wetlands. This includes 451 acres of NWI and NYSDEC tidal wetlands, 427 acres of NWI and NYSDEC tidal/freshwater wetlands, 62 acres of NYSDEC tidal wetlands, and 27 acres of NYSDEC tidal and freshwater wetlands. NWI wetlands include: 62 percent riverine, 17 percent palustrine emergent wetland, 17 percent palustrine forested/shrub wetlands, and 5 percent pond. NYSDEC tidal wetlands include approximately 56 percent of open water, 21 percent of gramminoid vegetation, and 12 percent of broad-leaf vegetation. In addition, there are a total of 1,178 acres of adjacent areas to tidal wetlands mapped. NYSDEC freshwater wetlands include approximately 90 percent of Class I wetlands and 10 percent of Class II wetlands.

In **Rensselaer County**, the existing Empire Corridor 90/110 Study Area passes through a total of 164 acres of mapped wetlands. Of the 164 acres, 66 acres are NWI and NYSDEC tidal wetlands, 76 acres are NWI and NYSDEC tidal and freshwater wetlands, 13 acres are NYSDEC tidal wetlands, and 9 acres are NYSDEC tidal and freshwater wetlands. NWI wetlands include: 44 percent of palustrine forested/shrub wetlands, 41 percent of riverine, and 13 percent of palustrine emergent wetland. NYSDEC tidal wetlands include approximately 53 percent of open water; 24 percent of gramminoid vegetation; 7 percent broad-leaf vegetation; 7 percent coastal shoals, bars, and mudflats; and 9 percent swamp tree. In addition, there are a total of 805 acres of adjacent areas to tidal wetlands mapped. NYSDEC freshwater wetlands include approximately 95 percent of Class I wetlands and 5 percent of Class II wetlands.

In Rensselaer County, the 125 Study Area passes through a total of 161 acres of mapped wetlands. Of the 161 acres, 62 acres are NWI and NYSDEC tidal wetlands, 76 acres are NWI and NYSDEC tidal

and freshwater wetlands, 13 acres are NYSDEC tidal wetlands, and 10 acres are NYSDEC tidal and freshwater wetlands. NWI wetlands include: 44 percent of palustrine forested/shrub wetlands, 40 percent of riverine, 13 percent of palustrine emergent wetland, and 2 percent of ponds. NYSDEC tidal wetlands include approximately 51 percent of open water; 24 percent of graminoid vegetation; 7 percent broad-leaf vegetation; 8 percent coastal shoals, bars, and mudflats; and 10 percent swamp tree. In addition, there are a total of 770 acres of adjacent areas to tidal wetlands mapped. NYSDEC freshwater wetlands include approximately 96 percent of Class I wetlands and 4 percent of Class II wetlands.

9.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

In **Albany County**, the study area passes through a total of 136 acres of mapped wetlands. The mapped wetlands include 75 acres of NWI wetlands, 28 acres of NWI and NYSDEC freshwater wetlands, 26 acres of NYSDEC freshwater wetlands, and 6 acres are NWI and NYSDEC tidal wetlands. NWI wetlands include: 64 percent of palustrine forested/shrub wetlands, 10 percent of palustrine emergent wetland, 9 percent pond, and 15 percent riverine. NYSDEC tidal wetlands include approximately 100 percent open water. In addition, there are a total of 166 acres of adjacent areas to tidal wetlands mapped. NYSDEC freshwater wetlands include only Class I wetlands.

West of Albany County, there are no NYSDEC tidal wetlands mapped. In **Schenectady County**, the study area includes a total of 103 acres of mapped wetlands. Of the 85 acres, 39 acres are NWI wetlands, 24 acres are NYSDEC freshwater wetlands, and 22 acres are NWI and NYSDEC freshwater wetlands. NWI wetlands include: 61 percent riverine, 25 percent of palustrine forested/shrub wetlands, 87 percent of palustrine emergent wetland, and 7 percent of ponds. NYSDEC freshwater wetlands include approximately 52 percent of Class I wetlands and 48 percent of Class II wetlands.

In **Montgomery County**, the study area crosses a total of 630 acres of mapped wetlands in the study area. The study area includes 181 acres of NYSDEC freshwater wetlands, 336 acres of NWI wetlands, and 113 acres of NWI and NYSDEC freshwater wetlands. The mapped NWI wetlands include: 11 percent palustrine emergent wetland, 4 percent of palustrine forested/shrub wetlands, 4 percent palustrine pond, and 82 percent of riverine. NYSDEC freshwater wetlands include approximately 29 percent of Class I wetlands, 66 percent of Class II wetlands, and 5 percent of Class IV wetlands.

In **Herkimer County**, the study area includes a total of 354 acres of mapped wetlands. The mapped wetlands include 26 acres of NYSDEC freshwater wetlands, 40 acres of NWI and NYSDEC freshwater wetlands and 288 acres of NWI wetlands. The mapped NWI wetlands include: 37 percent of palustrine forested/shrub wetlands, 16 percent of palustrine emergent wetlands, 5 percent palustrine pond, and 42 percent of riverine. NYSDEC freshwater wetlands are comprised entirely of Class II wetlands.

The study area crosses a total of 830 acres of mapped NYSDEC freshwater wetlands in **Oneida County** and 282 acres in **Madison County**. In Oneida County, NYSDEC freshwater wetlands include approximately 92 percent of Class II wetlands and 8 percent of Class IV wetlands. In Madison County, NYSDEC freshwater wetlands include 22 percent Class I wetlands and 78 percent Class II wetlands.

In **Onondaga County**, the study area crosses a total of 568 acres of mapped wetlands. This includes 152 acres of NWI wetlands, 212 acres of NWI and NYSDEC freshwater wetlands, and 204 acres of NYSDEC freshwater wetlands. NWI wetlands include: 70 percent of palustrine forested/shrub

wetlands, 18 percent of palustrine emergent wetland, 4 percent of riverine, 5 percent of lakes, and 2% of pond. NYSDEC freshwater wetlands include approximately 43 percent of Class I wetlands, 49 percent of Class II wetlands, and 8 percent of Class III wetlands.

In **Cayuga County**, the study area crosses a total of 200 acres of mapped wetlands. Of the 200 acres, 68 acres are NWI wetlands, 96 acres are NWI and NYSDEC freshwater wetlands, and 36 acres are NYSDEC freshwater wetlands. NWI wetlands include: 68 percent of palustrine forested/shrub wetlands, 21 percent of palustrine emergent wetlands, 2 percent freshwater pond, and 7 percent of riverine. NYSDEC freshwater wetlands include approximately 76 percent of Class II wetlands and 24 percent of Class III wetlands.

In **Wayne County**, the study area crosses a total of 919 acres of mapped wetlands. This includes 343 acres of NWI wetlands, 430 acres of NWI and NYSDEC freshwater wetlands, and 146 acres of NYSDEC freshwater wetlands. NWI wetlands include: 62 percent of palustrine forested/shrub wetlands, 23 percent of palustrine emergent wetlands, 11 percent of riverine, and 4 percent of ponds. NYSDEC freshwater wetlands include approximately 27 percent of Class I wetlands, 70 percent of Class II wetlands, 1 percent of Class III wetlands, and 2 percent of Class IV wetlands.

In **Monroe County**, the study area crosses a total of 306 acres of mapped wetlands. These include 138 acres of NWI wetlands, 125 acres of NWI and NYSDEC freshwater wetlands, and 43 acres of NYSDEC freshwater wetlands. NWI wetlands include: 70 percent of palustrine forested/shrub wetlands, 9 percent of palustrine emergent wetland, 6 percent of ponds, 7 percent riverine, and 7 percent of lakes. NYSDEC freshwater wetlands include approximately 35 percent of Class I wetlands and 65 percent of Class II wetlands.

In **Genesee County**, the study area crosses a total of 421 acres of mapped wetlands. This includes 250 acres of NWI wetlands, 119 acres of NWI and NYSDEC freshwater wetlands, and 52 acres of NYSDEC freshwater wetlands. NWI wetlands include: 61 percent of palustrine forested/shrub wetlands, 20 percent of palustrine emergent wetland, 9 percent of ponds, 5 percent riverine, and 5 percent of lakes. NYSDEC freshwater wetlands include approximately 12 percent of Class I wetlands, 74 percent of Class II wetlands, and 14 percent of Class III wetlands.

In **Erie County**, the study area crosses a total of 212 acres of mapped wetlands. This includes 176 acres of NWI wetlands, 26 acres of NWI and NYSDEC freshwater wetlands, and 10 acres of NYSDEC freshwater wetlands. NWI wetlands include: 74 percent of palustrine forested/shrub wetlands, 4 percent of ponds, and 20 percent of riverine. NYSDEC freshwater wetlands include only Class II wetlands.

In **Niagara County**, the study area crosses a total of 66 acres of mapped NWI wetlands. NWI wetlands include: 64 percent of palustrine forested/shrub wetlands, 18 percent of palustrine emergent wetland, 7 percent of ponds, and 11 percent of riverine.

9.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

In **Albany County**, the study area passes through a total of 12 acres of mapped wetlands. The mapped wetlands include four acres of NWI wetlands and seven acres of NWI and NYSDEC tidal wetlands, and one acre of NYSDEC tidal wetlands. There are no NWI and NYSDEC freshwater wetlands or NYSDEC freshwater wetlands mapped in the study area in Albany County. NWI wetlands include: 69 percent riverine, 15 percent of palustrine forested/shrub wetlands, 8 percent freshwater

pond, and 8 percent of palustrine emergent wetland. NYSDEC tidal wetlands include 100 percent open water. In addition, there are a total of 75 acres of adjacent areas to tidal wetlands mapped.

West of Albany County, there are no NYSDEC tidal wetlands mapped. In **Schenectady County**, the study area includes a total of 60 acres of mapped wetlands. All of the 60 acres are NWI wetlands. NWI wetlands include: 18 percent of palustrine forested/shrub wetlands, 13 percent of palustrine emergent wetland, 13 percent freshwater pond, and 55 percent riverine. .

In the study area in **Schoharie County**, the study area includes a total of 51 acres of mapped wetlands. All the 51 acres are NWI wetlands. NWI wetlands include: 4 percent of palustrine forested/shrub wetlands, 14 percent of palustrine emergent wetland, 4 percent freshwater pond, and 78 percent riverine.

In **Montgomery County**, the study area crosses a total of 144 acres of mapped wetlands. The study area includes 62 acres of NWI wetlands and 118 acres of NYSDEC freshwater wetlands. The mapped NWI wetlands include: 55 percent of palustrine emergent wetland, 14 percent of palustrine forested/shrub wetlands, 18 percent of freshwater ponds, and 12 percent riverine. NYSDEC freshwater wetlands include approximately 98 percent of Class I wetlands and 2 percent of Class II wetlands.

In **Herkimer County**, the study area includes a total of 81 acres of mapped wetlands. The mapped wetlands include five acres of NYSDEC freshwater wetlands, four acres of NWI and NYSDEC freshwater wetlands, and 72 acres of NWI wetlands. The mapped NWI wetlands include: 43 percent of palustrine forested/shrub wetlands, 39 percent of riverine, 12 percent of palustrine emergent wetlands, and 5 percent of freshwater ponds. NYSDEC freshwater wetlands are comprised entirely of Class II wetlands.

The study area crosses a total of 252 (62 acres of NWI mapped wetlands, 118 acres of NWI and NYSDEC freshwater wetlands, and 72 acres NYSDEC wetlands) acres of mapped wetlands in Oneida County and 91 (80 acres of NWI mapped wetlands, and 11 acres of NWI and NYSDEC freshwater wetlands) acres in Madison County. In Oneida County, the mapped NWI wetlands include: 84 percent of palustrine forested/shrub wetlands, 4 percent of riverine, 6 percent of palustrine emergent wetlands, and 5 percent of freshwater ponds. While in Madison, the NWI wetlands include: 75 percent of palustrine forested/shrub wetlands, 13 percent of riverine, 8 percent of palustrine emergent wetlands, and 11 percent of freshwater ponds. In Oneida County, NYSDEC freshwater wetlands include approximately 79 percent of Class II wetlands, 17 percent of Class III wetlands, and 4 percent of Class IV wetlands. In Madison County, NYSDEC freshwater wetlands include 99 percent Class II wetlands and 1 percent Class III wetlands.

In **Onondaga County**, the study area crosses a total of 484 acres of mapped wetlands. This includes 102 acres of NWI wetlands, 163 acres of NWI and NYSDEC freshwater wetlands, and 219 acres of NYSDEC freshwater wetlands. NWI wetlands include: 74 percent of palustrine forested/shrub wetlands, 3 percent of ponds, 12 percent of palustrine emergent wetland, and 12 percent of lakes/riverine. NYSDEC freshwater wetlands include approximately 47 percent of Class I wetlands, 42 percent of Class II wetlands, and 11 percent of Class III wetlands.

In **Cayuga County**, the study area crosses a total of 158 acres of mapped wetlands. Of the 157 acres, 45 acres are NWI wetlands, 86 acres are NWI and NYSDEC freshwater wetlands, and 27 acres are NYSDEC freshwater wetlands. NWI wetlands include: 91 percent of palustrine forested/shrub wetlands, 5 percent of palustrine emergent wetlands, and 4 percent of riverine. NYSDEC freshwater

wetlands include approximately 87 percent of Class II wetlands and 13 percent of Class III wetlands.

In **Wayne County**, the study area crosses a total of 352 acres of mapped wetlands. This includes 123 acres of NWI wetlands, 191 acres of NWI and NYSDEC freshwater wetlands, and 38 acres of NYSDEC freshwater wetlands. NWI wetlands include: 84 percent of palustrine forested/shrub wetlands, 7 percent of palustrine emergent wetlands, 5 percent of riverine, and 4 percent of lakes/ponds. NYSDEC freshwater wetlands include approximately 30 percent of Class II wetlands and 70 percent of Class III wetlands.

In **Monroe County**, the study area crosses a total of 265 acres of mapped wetlands. These include 138 acres of NWI wetlands, 106 acres of NWI and NYSDEC freshwater wetlands, and 21 acres of NYSDEC freshwater wetlands. NWI wetlands include: 83 percent of palustrine forested/shrub wetlands, 5 percent of palustrine emergent wetland, and 13 percent of ponds, riverine, and lakes. NYSDEC freshwater wetlands include approximately 10 percent of Class I wetlands, 72 percent of Class II wetlands, and 18 percent of Class III wetlands.

In **Genesee County**, the study area crosses a total of 427 acres of mapped wetlands. This includes 234 acres of NWI wetlands, 182 acres of NWI and NYSDEC freshwater wetlands, and 11 acres of NYSDEC freshwater wetlands. NWI wetlands include: 86 percent of palustrine forested/shrub wetlands, 7 percent of palustrine emergent wetland, and 7 percent riverine/ponds. NYSDEC freshwater wetlands include approximately 50 percent of Class I wetlands, 18 percent of Class II wetlands, and 32 percent of Class III wetlands.

In **Erie County**, the study area crosses a total of 280 acres of mapped wetlands. This includes 184 acres of NWI wetlands, 83 acres of NWI and NYSDEC freshwater wetlands, and 13 acres of NYSDEC freshwater wetlands. NWI wetlands include: 70 percent of palustrine forested/shrub wetlands, 8 percent of palustrine emergent wetland, and 22 percent of ponds/riverine/lakes. NYSDEC freshwater wetlands include approximately 65 percent of Class I wetlands and 35 percent of Class II wetlands.

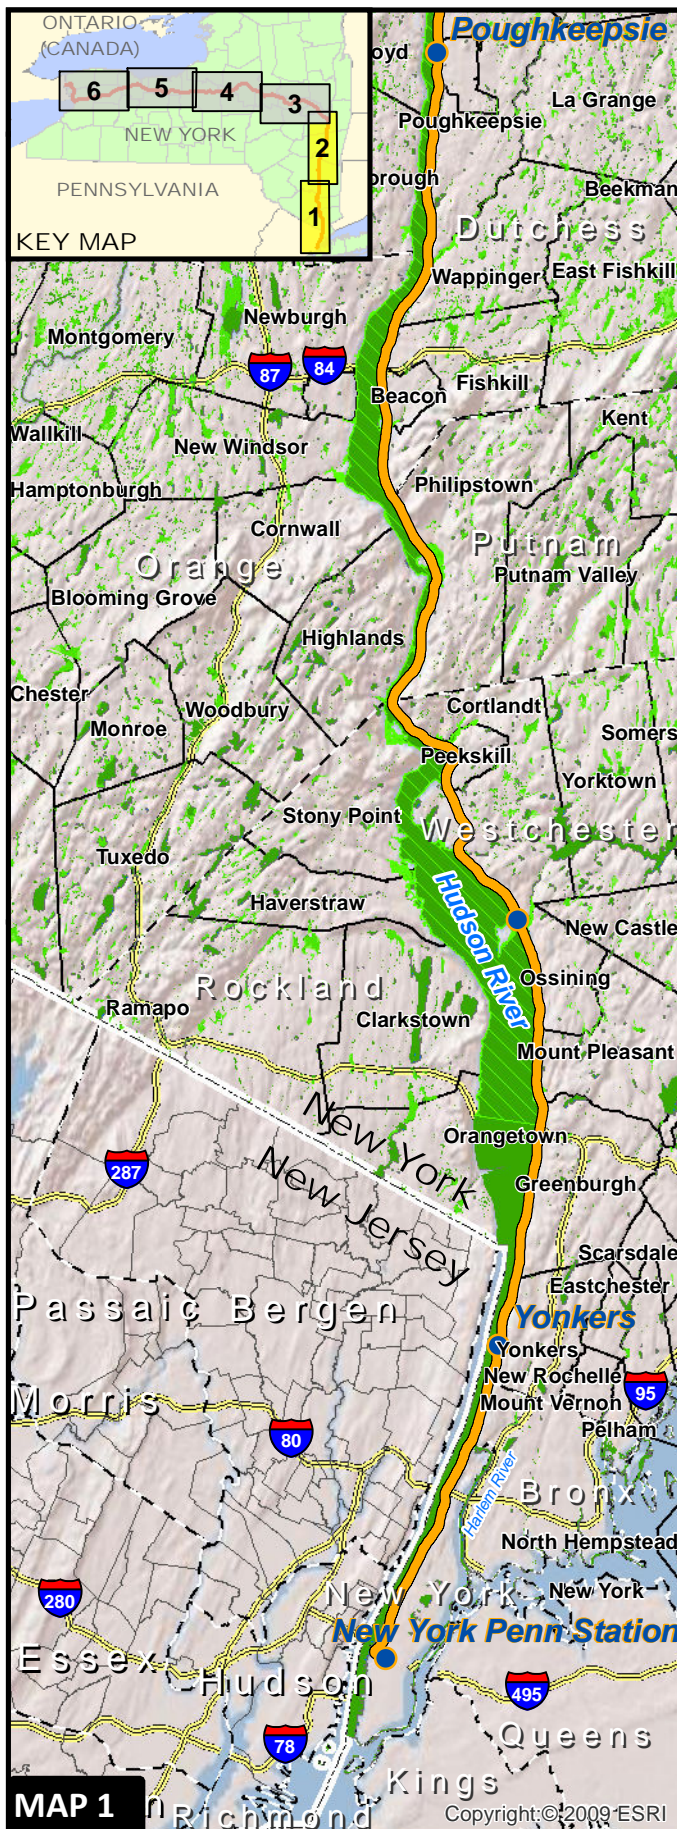

In **Niagara County**, the study area crosses a total of 66 acres of mapped NWI wetlands. NWI wetlands include: 63 percent of palustrine forested/shrub wetlands, 18 percent of palustrine emergent wetland, 7 percent of ponds, and 10 percent of riverine.

9.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.10). The potential effects impacts of the Base Alternative and other Build Alternatives are described in more detail below.

9.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies. The Tier 1 Draft EIS addressed the potential impacts on wetlands of the eight projects included in the Base Alternative.

Empire Corridor Program

9.2.2 Alternative 90A

Although some of this work would be conducted within the existing right-of-way, ground disturbance in proposed work areas that overlap mapped wetlands, either inside or outside the existing right-of-way, could cause wetland impacts through dredging, filling or other disturbance.

Empire Corridor South

Depending on design of rock slope stabilization, there is potential for impact to wetlands and waters associated with the Hudson River and its tributaries through dredging, filling or other construction impacts. Alternative 90A would include construction of four miles of second track through urbanized areas of Manhattan (SRP-1, MPs 9 to 13) and 1.4 miles of new track extending under the Tappan Zee Bridge (SRP-2, 23.8-25.2). The Hudson River is adjacent to the rail line throughout these proposed improvement areas. One mapped NWI and NYSDEC wetlands associated with the Hudson River and the Harlem River confluence is located in the proposed work area. Additional track construction over the Harlem River (MP 10) could have the potential to temporarily or permanently impact mapped wetlands at this location. Improvements under the Tappan Zee Bridge would be within the current right-of-way and impacts to wetlands would be unlikely.

With Alternative 90A, signal improvements proposed along 43 miles (MPs 32.8 and 75.8) would cross mapped NWI and NYSDEC wetlands approximately 30 times. Crossings are generally small areas of overlap connected to larger adjacent mapped areas associated with the Hudson River and its tributaries to the east. Proposed work would primarily involve signal upgrades within the existing rail bed; therefore, it is unlikely that impacts would occur to wetlands for these improvements.

New third track in Dutchess County (SRP-3, MPs 53 to 63) would cross wetlands associated with Breakneck Brook (MP 54) and, depending on construction design, a cove at the confluence of Fishkill Creek and the Hudson River (MPs 57.5 to 57.75). In addition, improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) would cross Sunfish Cove and its associated wetlands. Ground disturbance in the above-mentioned work areas that overlap wetlands could cause impacts through dredging, filling or other disturbance.

North of Poughkeepsie and south of Albany-Rensselaer Station, the alignment would cross mapped wetland areas approximately 7 times. NYSDOT anticipates that the new control points and station improvements would occur largely within the right-of-way or current station footprint, and would not likely involve impacts to wetlands.

Alternative 90A would include the replacement of the Livingston Avenue Bridge over the Hudson River (ES-15, MP 143).

Empire Corridor West/Niagara Branch

Track improvements along the Empire Corridor West/Niagara Branch would include 10 miles of third track between MPs 169 and 179 (EW-14a) and Amsterdam Station improvements along the west end of this segment (EIS-1, MP 177.6). Wetlands generally associated with the Mohawk River are mapped as abutting the right-of-way on its southern edge for a majority of the proposed work areas along this 10-mile segment and cross the alignment three times around MP 178. Although this work would be conducted within the existing right-of-way, ground disturbance and construction in proposed work areas that overlap wetland areas could cause wetland impacts through dredging or filling activities. Updates to three control points (EW-05, MPs 175, 239 and 248) would not cross any wetlands and would not likely involve impacts to wetlands.

Alternative 90A would include Syracuse Station track improvements (EIS-6, MPs 290 to 294), and third track improvements along 11 miles (EW-16, MPs 373 to 382) west of the Rochester Station. Work for the Syracuse Station would be adjacent to mapped wetlands associated with Ley Creek and Onondaga Lake and would also include crossings of eight mapped wetlands: one associated with the Erie Canal and one associated with Onondaga Lake. West of the Rochester Station, proposed improvements would cross two mapped NWI and NYSDEC wetlands associated with the Erie Canal (MP 374.5), and a tributary of Black Creek (MP 379.5). Therefore, reconstruction of the Syracuse Station and third track improvements west of Rochester would have the potential to impact wetlands through dredging, filling, or construction activities at these crossings.

The addition of a third track is proposed along 11 miles located largely west of the designated urban area around Rochester (EW-20, MPs 382 to 393). Mapped wetland areas, primarily associated with Black Creek and its tributaries, would be crossed approximately 11 times at these proposed work locations. Although this work would be conducted within the existing right-of-way, ground disturbance and construction in proposed work areas that overlap wetland areas could cause wetland impacts through dredging or filling activities.

Two small mapped wetland areas would be crossed at the proposed work area of station improvements of the Buffalo-Depew Station (EIS-10, MPs 429 to 433). In addition, along the proposed double tracking work area (EW-17, MPs QDN17 to QDN23.2 along the Niagara Branch, work would cross three mapped wetland areas associated with Bergholtz and Cayuga Creeks. Work conducted within these mapped wetland areas described above would have the potential to impact the wetland through dredging, filling or construction activities. Niagara Falls Maintenance Facility and track improvements (EW-18 and EIS-12, MPs 25 to 28) would not cross any mapped wetlands areas and would not likely involve impacts to wetlands.

9.2.3 Alternative 110

With Alternative 110, there is the potential for 911 new and existing crossings along Empire Corridor. Road realignment, access road construction, and culvert improvements are also proposed under Alternative 110 within and outside of the right-of-way,

Empire Corridor South

No additional work within Empire Corridor South, other than for Alternative 90A, is proposed, and there would be no potential for additional impacts to wetlands in this area for Alternative 110.

Empire Corridor West/Niagara Branch

NWI and NYSDEC have mapped several wetland features within the proposed work areas of third and fourth track installation associated with Alternative 110, both within and outside of the current right-of-way.

Since the third track would be situated farther from the existing tracks than Alternative 90B to accommodate 110 mph MAS, there would be slightly more wetland crossings than identified in Alternative 90B. Alternative 110 would cross the same number of mapped wetlands in Montgomery, Herkimer, Onondaga and Erie Counties as the 90B, and there would be no additional impacts (as identified at the Tier 1 level) to wetlands in these counties for Alternative 110.

In Schenectady County, Alternative 110 would cross two mapped wetland areas. Proposed new track of Alternative 110 would cross mapped wetlands approximately 26 times in Oneida County, three times in Madison County, nine times in Cayuga County, 21 times in Wayne County, 17 times in Monroe County and 18 times in Genesee County.

9.2.4 Alternative 125

With Alternative 125, there is the potential for 760 new and existing crossings along Empire Corridor. Areas that are mapped as wetlands within the proposed Alternative 125 corridor could be impacted directly by new crossings for construction of rail infrastructure. Wetlands outside of the proposed Alternative 125 corridor could be indirectly impacted by modifications of local hydrology through installation of new tracks. Impacts would be more likely to occur than with the Base, 90A, 90B (the Preferred Alternative), and 110 Alternatives.

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. This work would have the potential to impact areas of wetlands associated with this portion of the Hudson River. Wetlands could be impacted at this location as a result of activities such as ground disturbance, dredging or filling of the wetlands.

Empire Corridor West/Niagara Branch

Alternative 125 also would include new right-of-way in most areas, but would merge back with the Empire Corridor over two 15- and 16-mile segments centered around Syracuse and Rochester, respectively.

Installation of the new tracks proposed for Alternative 125 would have the potential to impact a number of wetlands mapped by both NWI and NYSDEC, and more wetlands overall than Alternatives 90A, 90B, or 110 alone. All of the wetlands mapped within the proposed alignment could be impacted by Alternative 125. There would be approximately 760 locations where new track would cross mapped wetland areas. These areas are further described below.

In Schenectady County, Alternative 125 would cross three larger mapped wetlands that have

developed along the New York State Thruway between MPs QH158.5 and QH160.5. With the exception of small wetlands around MP QH163.8, MPs QH171 to QH172 and MP QH173.5, no other mapped wetlands would be crossed by the 125 Study Area in the county. In Schoharie County, Alternative 125 would cross 12 mapped wetlands, which are associated with the northern banks of Schoharie Creek (MPs QH174 to QH176) as well as several tributaries of Schoharie Creek, and it is likely that there would be wetlands in these areas.

In Montgomery County, there would be one crossing of a larger wetland mapped between MPs QH181 and QH183.5 associated with Fly Creek, and smaller crossings of wetlands associated with tributaries of the Mohawk River between MPs QH194.5-QH196 and at the county line (MP QH202). In Herkimer County, there would be several small crossings of small wetlands at roughly MPs QH203.5, QH212.75, QH213.25, and QH225.

Alternative 125 would have approximately nine crossings of larger interconnected wetlands associated with Deans Creek, Beaver Meadow Creek and other tributaries between MPs QH240 and QH247 in Oneida County. After crossing Oneida Creek at the eastern Madison County border, the Alternative 125 would cross two small wetland areas (MPs QH249.5 and QH249.75).

In Onondaga County, the 125 Study Area crosses approximately 59 mapped wetland areas. In the eastern portion of the county, there is a large wetland system between the Old Erie Canal and Chittenango Creek (MPs QH264.75 to QH271) that Alternative 125 would cross numerous times. Around Onondaga Lake, Alternative 125 would cross wetlands associated with the Old Barge Canal and the lake (MP QH278.5), before heading further west and crossing numerous small wetlands associated with Nine Mile Creek, Dead Man Creek, Cross Lake, Seneca River and other tributaries (MPs QH283.75 to QH295).

Alternative 125 would cross approximately 32 individual wetlands associated with roughly 11 wetland systems in Cayuga County. Most of these systems are associated with tributaries of the Seneca River, including Muskrat Creek and the Howland Island Wildlife Management Area on the west end of the county.

In Wayne County, wetlands are more pervasive, where there would be approximately 146 crossings of mapped wetland areas under Alternative 125. The majority of these crossings would be over small wetlands associated with tributaries of the Erie Canal, Black Creek, Clyde River, Ganargua Creek and Red Creek. In Monroe County, Alternative 125 would cross approximately 60 mapped wetlands. In the eastern portion of the county, the alignment would cross several small wetlands associated with Thomas Creek and its tributaries (MPs QH342 to QH346.5). It would then cross wetlands associated with Irondequoit Creek (MP QH347.5), the Genesee River (MP QH356), the Erie Canal (MP QH359) and a large system of wetlands associated with Little Black Creek and its tributaries (MPs QH360 to QH367.5).

Alternative 125 would cross approximately 89 mapped wetlands in Genesee County. In the eastern portion of the county, the alignment would cross several areas of wetlands associated with Black Creek and Bergen Swamp (MPs QH373 to QH378). Bergen Swamp in Genesee County is one of the largest mapped wetlands that fall within the proposed Alternative 125 alignment. The alignment would then cross isolated wetlands areas associated with Oak Orchard Creek, Murder Creek, Tonawanda Creek and tributaries through the rest of the county.

There would be approximately 40 wetland crossings in Erie County. There is a larger wetland system associated with Ransom Creek (MPs QH406.5 to QH409); however, most of the crossings in Erie

County are small and do not appear to be associated with major waterways.

10. Coastal Resources

10.1 Existing Conditions

Chapter 4 addresses protected coastal resources, such as the coastal zone and inland designated waterways. Exhibit G-13, Exhibit G-14, and Exhibit G-15 show the study area coastal resources and Local Waterfront Revitalization Programs designated under the state coastal program.

The protections for coastal areas in New York State include federal protections for coastal barriers. The Coastal Barrier Resources Act² established the John H. Chafee Coastal Barrier Resources System to promote more appropriate use and conservation of coastal barriers along the Atlantic, Gulf, and Great Lakes coastlines.

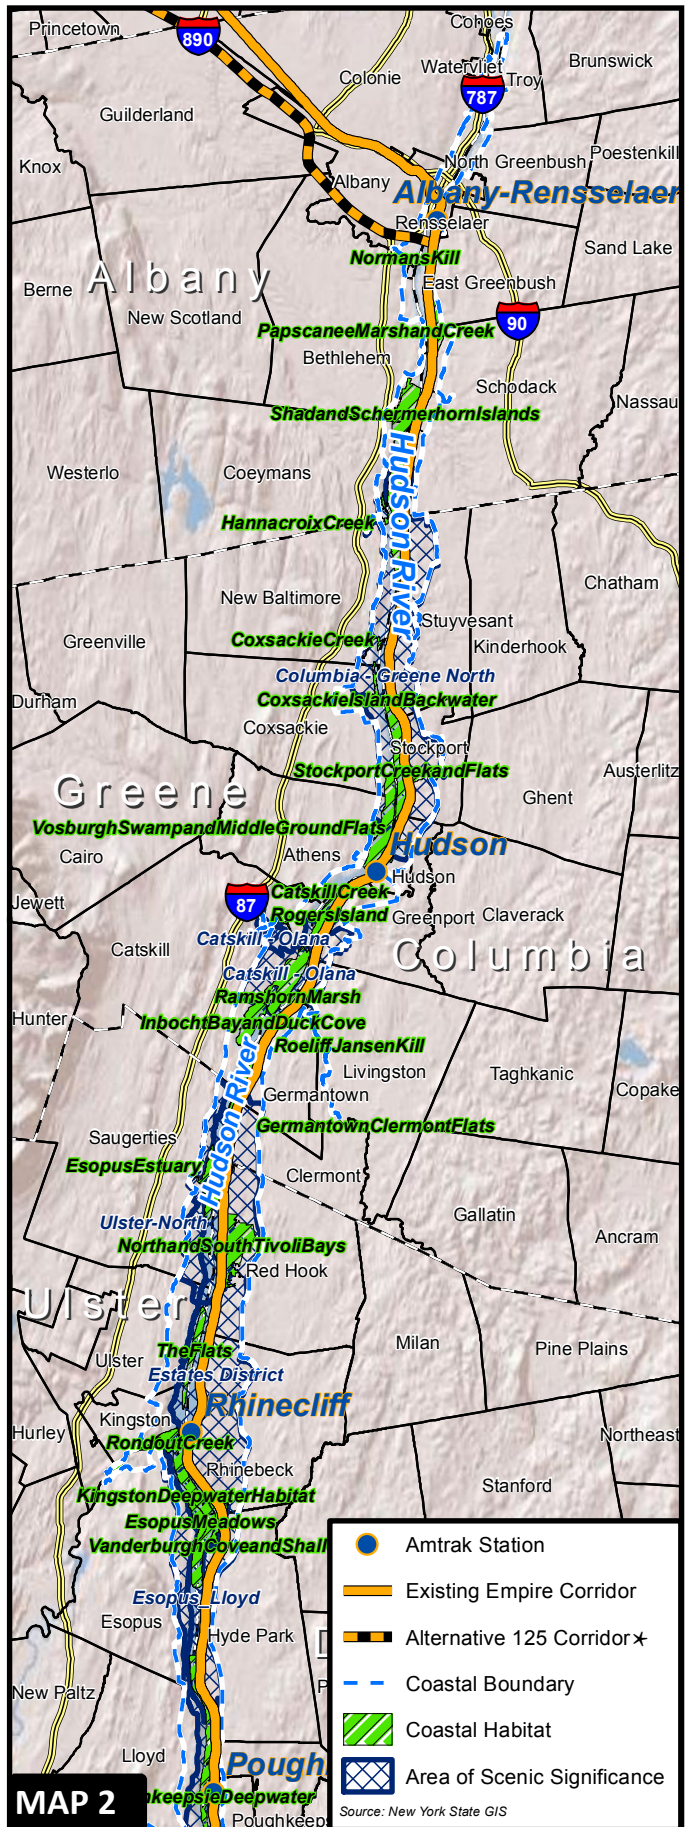

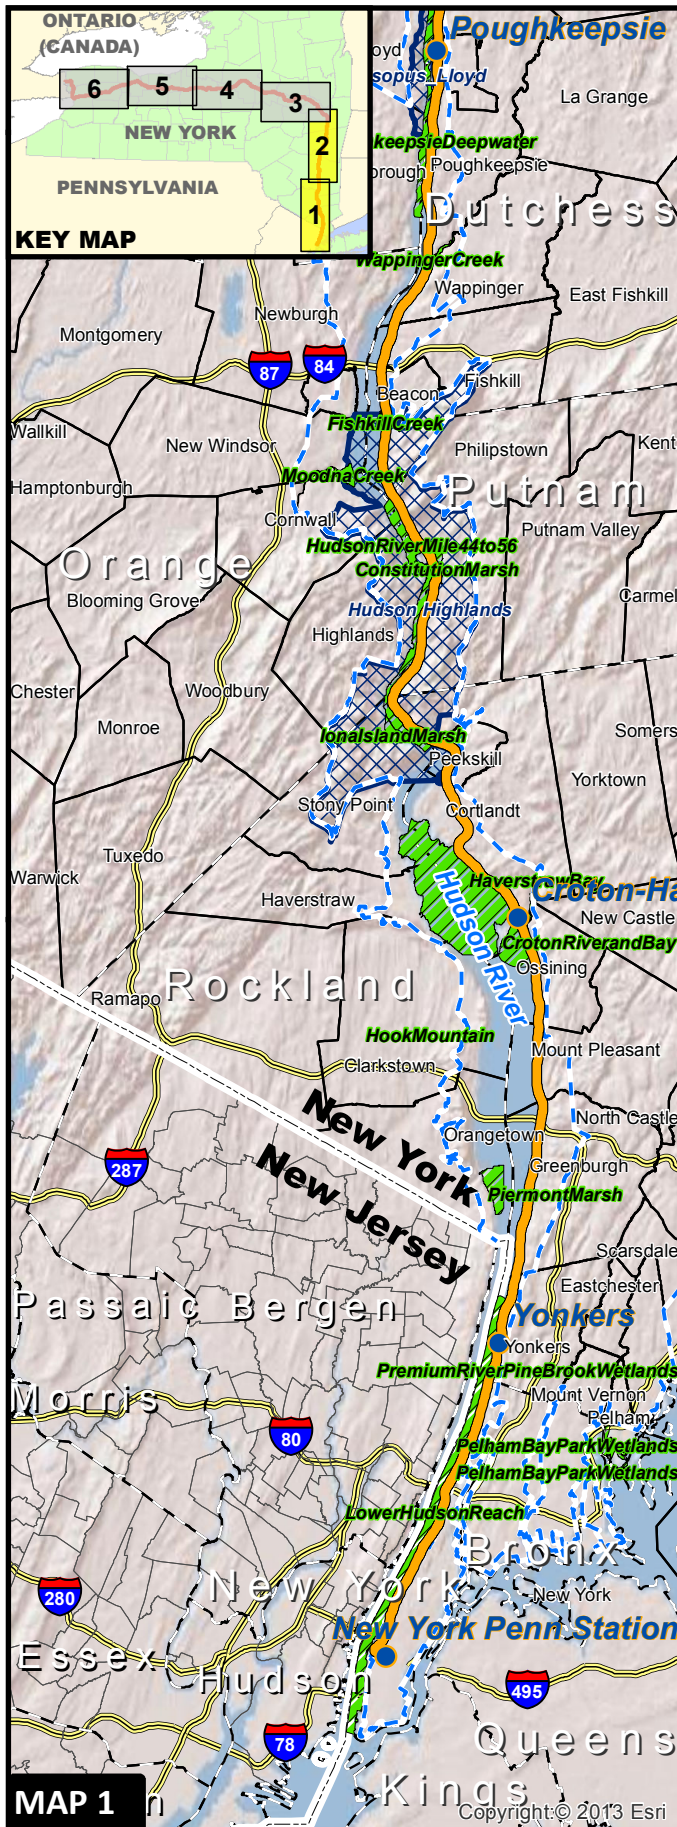

The state legislature has also designated for protection Coastal Erosion Hazard Areas that include areas along the shorelines of Lake Erie and Lake Ontario, the Atlantic Ocean and Long Island Sound³. The New York State Department of Environmental Conservation (NYSDEC) created the Coastal Erosion Control Permit Program to make sure that construction and other activities on specified coastal hazard areas meet the standards for permit issuance.

Under the Local Waterfront Revitalization Program (LWRP), communities along the designated coastal waterbodies and these inland designated waterways can enact Local Waterfront Revitalization Plans. Along the Empire Corridor South, there are 19 communities within a half mile of the corridor centerline on the east side of the Hudson River that are covered by LWRPs.

There are three communities on the west side of the Hudson River that fall within a half mile of the Empire Corridor South corridor centerline that have enacted LWRPs. There are eight communities within a half mile of the 90/110 and the 125 Study Areas between Albany Empire Corridor West/Niagara Branch corridor centerline that have enacted LWRPs. In addition to the eight individual communities with LWRP's in the Empire Corridor West/Niagara Branch section, there are two regional LWRP's that involve multiple communities within the watershed. This includes the *Mohawk River Waterfront Revitalization Plan for Schenectady County* and the *Mid-Montgomery County LWRP*, which includes several other municipalities along the Mohawk River. Exhibit G-14 lists by county those communities that have enacted Local Waterfront Revitalization Plans. With the exception of Amsterdam and North Greenbush, all the communities listed as having LWRPs are within a half mile of the corridor centerline for both the 90/110 and the 125 Study Areas. The City of Amsterdam and the Town of North Greenbush are within a half mile of the 90/110 Study Area only; not the 125 Study Area.

² U.S. Coastal Barrier Resources Act of 1982, Public Law 106-67 (16 U.S.C. 3501-3510), 1982.

³ Coastal Erosion Hazard Areas, Article 34, ECL, and Coastal Erosion Management Regulations, 6 NYCRR Part 505.

<http://nyswaterfronts.com/LWRP_Status.asp>.

The coastal zone along the Empire Corridor South also includes six state-designated Scenic Areas of Statewide Significance. The six SASSs in the study area are described below:

- **The Hudson Highlands SASS** encompasses a 20-mile stretch of the Hudson River and its shorelands and varies in width from approximately 1 to 6 miles. The SASS includes the east and west shorelands of the river, extending from Newburgh on the north to Peekskill on the south. The Hudson River has carved a spectacular gorge through the Hudson Highlands. The present shoreline configuration includes steep cliffs, bluffs, and gently sloping banks. Railroads hug the shoreline of the Hudson River and roads follow the hillside contours and inland valleys. There are two military sites within the SASS, the undeveloped parts of the Camp Smith Military Reservation and the West Point Military Academy, both with extensive areas of open space. The present-day land use pattern of the Hudson Highlands is dominated by state parkland, preserving much of the open space of the SASS.
- **The Estates District SASS** is located approximately 12 miles north of the Hudson Highlands SASS and 3 miles south of the Catskill-Olana SASS. The SASS extends approximately 27 miles to south of the Franklin D. Roosevelt Home National Historic Site. As its name implies, the Estates District SASS is dominated by over 20 major and numerous minor historic estates and the Hudson River toward which they are oriented. The landform consists of rolling topography behind steep bluffs, which drop 150 feet to the Hudson River. The shoreline of the Hudson is characterized by coves, marshes and scattered islands along the eastern shore. When seen from a distance, however, the east bank shoreline appears unbroken because railroad causeways bridge the natural indentations and transform the east bank into a single fluid line.
- **The Esopus/Lloyd SASS** encompasses a 17-mile stretch of the Hudson River and its western shorelands and varies significantly in width from 0.75 to 2 miles. The SASS extends from its northern boundary, which runs from south of the hamlet of Port Ewen, extending through Poughkeepsie to its southern boundary in the hamlet of Milton. The SASS includes the Hudson River from the mean high tide line on the eastern shore, for much of its length sharing a common boundary with the Estates District SASS on the eastern shorelands of the Hudson River. The SASS is dominated by a long stretch of bluffs along the Hudson River shorelands.
- **The Ulster North SASS** encompasses a 10-mile stretch of the Hudson River and its western shorelands and varies from 1.25 miles to 2.5 miles in width. The SASS extends from its northern boundary at the Ulster/Greene County line to its southern boundary at Ulster Landing Park. The SASS includes the Hudson River from the mean high tide line on the eastern shore for all of its length, sharing a common boundary with the Estates District SASS on the eastern shorelands of the Hudson River. It is characterized by a gently rolling upland landscape set above a steep bluff reaching elevations of 150 feet.
- **The Catskill-Olana Scenic Area of Statewide Significance (SASS)** consists of a portion of the Hudson River and its shorelands, an area approximately 5½ miles long and three miles wide. Its northern boundary incorporates Catskill, Rogers Island, and Greenport and extends south to Germantown. The area is known as the home of two major artists of the Hudson River School of Painting, Thomas Cole and Frederic Church. Thomas Cole, considered the father of the Hudson River School, America's first landscape painting movement, established his home and studio in Catskill. Frederic Church was Thomas Cole's only student. The promontory on the east shore is where Church constructed his estate, Olana. Catskill-Olana SASS exhibits an unusual variety of landforms including floodplains and steep ravines that rise 250 feet above; forested bluffs along the Hudson River; plateaus and rolling farmland south of Catskill Village and the promontory of Church's Hill. A variety of waterways are present, the Hudson River and its coves, channels and inlets being the most prominent.

- **The Columbia-Greene North Scenic Area of Statewide Significance (SASS)** is located roughly 3 miles north of the Catskill-Olana SASS. This SASS extends about 15 miles along the Hudson River from the vicinity of Schodack Landing in southern Rensselaer County and Coeymans hamlet in southern Albany County southward to Greenport, just north of the City of Hudson in Columbia. The scenic area's east and west boundaries generally follow the state coastal boundary with some variations. The SASS constitutes a predominantly rural area of low bluffs and ravines, flanked on the west shore by narrow alluvial plains and on the east shore, by a broader plateau. It is a quiet, pastoral area of working farms and river landings, which has changed little since the 19th century.

The coastal zone along the study area includes 31 Significant Coastal Fish and Wildlife Habitats (SCFWH) as shown in Exhibit G-15.

10.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.11). The potential effects impacts of the Base Alternative and other Build Alternatives are described in more detail below.

10.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Base Alternative will maintain weekday service frequencies. The Tier 1 Draft EIS addressed the potential impacts on coastal resources of the eight projects included in the Base Alternative.

10.2.2 Alternative 90A

Empire Corridor South

Alternative 90A includes construction of four miles of second track through urbanized areas of Manhattan (MPs 9 to 13). The **Lower Hudson Reach SCFWH** adjoins the railroad where it closely borders the Hudson River between MPs 1 to 17, but the second track would be located within the right-of-way, and this work is not anticipated to involve coastal impacts. Alternative 90A also includes 1.4 miles of new track (MPs 23.8 to 25.2), extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking. This work would not affect SCFWHs or SASSs and would be within the right-of-way, and is not anticipated to involve coastal impacts.

With Alternative 90A, signal improvements proposed along 43 miles (MPs 32.8 and 75.8) extend through urban areas (Westchester and Dutchess Counties). Along this section, 10 miles of new third track (MPs 53 to 63) and improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) are also proposed in Dutchess County. The **Croton River and Bay SCFWH** adjoins or crosses the railroad between MPs 31 to 33.5, and the **Haverstraw Bay SCFWH** adjoins the railroad between MPs 34 and 37. The railroad extends adjacent to or through the **Hudson River Mile 44 to 56 SCFWH** between MPs 42.5 and 54.5. The railroad adjoins the **Constitution Marsh SCFWH**, on the west, between MPs 50.5 to 52.3. The railroad extends through or adjoins the **Fishkill Creek SCFWH** between MPs 57.3 and 57.7. The railroad adjoins or extends through the **Wappinger Creek SCFWH** between MPs 63.8 and 65. The **Poughkeepsie Deepwater Habitat** extends within 200 feet west of

Exhibit G-15—Significant Coastal Fish and Wildlife Habitats within 1/2 Mile

County	Significant Coastal Fish and Wildlife Habitat	SCFWH Acreage	Significance Value

Niagara	Lower Niagara River Rapids	2	73

Source: NYSDOS Division of Coastal Resources. "Significant Coastal Fish and Wildlife Habitat," Accessed January 15, 2012.

<http://nyswaterfronts.com/waterfront_natural_narratives.asp>

the railroad between MPs 67.5 and 79.4. New third track 53 to 53.2 and from 53.5 to 54.5 will adjoin the east side of the **Hudson River Mile 44-56 SCFWH**, but since work would be contained within the right-of-way, impacts to this area are not anticipated. The remaining SCFWHs would not be affected by Alternative 90A improvements, which would be confined to the right-of-way.

The railroad extends through the **Vanderburgh Cove and Shallows SCFWH** between MPs 85 and 87. However, no work is proposed in this area, the Rhinecliff Station improvements are located two miles to the north (MP 89.2). Between MPs 95.3 and 98.3, the railroad extends through the **North and South Tivoli Bays SCFWH**, which is one of four tidal wetland sites federally designated and state-protected as part of the **Hudson River National Estuarine Research Reserve**. Alternative 90A does not involve work at these locations, so no impacts would occur at these SCFWHs. Between MPs 99 and 100, the railroad closely borders on the **Esopus Estuary SCFWH**, extending within 100 feet over a distance of 700 feet. This is in the vicinity of the proposed crossover (CP99 at MPs 98.4 to 98.94), but this work would not extend outside of the right-of-way and is not anticipated to affect the Esopus Estuary SCFWH.

Between MPs 100.5 to 105.3, the railroad adjoins the eastern side of the **Germantown-Clermont Flats SCFWH**, and rock slope stabilization proposed at five locations from MPs 105.3 to 106 would occur within the right-of-way and is not anticipated to impact coastal impacts. At MP 108, the railroad closely borders the **Roeliff Jansen Kill SCFWH** to the east, and work for Alternative 90A is not anticipated at this location.

The railroad extends through the **Hudson Highlands SASS** between MPs 40.5 to 57.8. The signal improvements and addition of a third track (between MPs 53 and 58) would not affect the visual quality of this SASS.

This area extends through the **Estates District SASS**, which extends to the mean high tide line on the eastern shore of the Hudson River between MPs 76.5 and 103.5. The district borders the adjoining **Esopus-Lloyd SASS** (MPs 70 to 87.5) and **Ulster-North SASS** (MPs 95 to 103.5) to the west and including the river. The railroad passes through the **Catskill-Olana SASS** between MPs 87 and 112. Improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) and Rhinecliff Station (MP 89.2), and Hudson Line Reliability Improvements at CPs 82 and 99 (MPs 82 and 99) would extend within the southern SASSs, but should not change the visual quality of these areas.

Between MPs 115.3 and 131.5, the railroad extends through the **Columbia-Green North SASS**. Rock slope stabilization proposed at MP 119.5 (one location) and MPs 128.1 to 130 (4 locations) would extend within this SASS, but would not change the scenic quality of the area.

No work is proposed in the immediate vicinity of the **Mill Creek Wetlands SCFWH** (MPs 125.5 to 127).

A new crossover, CP 136, is proposed at MP 136, and this work would extend within the **Papscane Marsh and Creek SCFWH** (MPs 135 to 139.3), but is not anticipated to impact the SCFWH.

The replacement of the Livingston Avenue Bridge (MPs 143.2 to 144) will occur within the coastal zone, but will not affect SCFWHs or SASSs. The disturbance to the coastal zone will be temporary in nature and represents a replacement of an existing structure.

Empire Corridor West/Niagara Branch

Other improvement proposed with Alternative 90A include approximately 10 miles of third track between MPs 169 and 178.5; Amsterdam Station improvements along the west end of this segment; and upgrades to interlockings and automatic block signals at three control points (CP 175, CP 239, and CP 248). Alternative 90A also includes Syracuse Station track improvements (MPs 290 to 294), third track improvements along 11 miles (MPs 373 to 382) west of the station, the addition of a third track along 11 miles located largely west of the urban area around Rochester and extending into Genesee County, and Buffalo-Depew Station improvements. These Alternative 90A improvements are located outside of the coastal zone.

The proposed double track along the Niagara Branch (at MP QDN17) intersect the coastal boundary along the Niagara River. These improvements would be located within the right-of-way and would, or did not, involve substantial coastal impacts.

10.2.3 Alternative 110**Empire Corridor South**

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, are proposed, and coastal zone impacts are not anticipated to occur as this work is expected to be confined to the right-of-way.

Empire Corridor West/Niagara Branch

With Alternative 110, impacts to the coastal zone would be the same as for Alternative 90B.

10.2.4 Alternative 125**Empire Corridor South**

No additional work, other than that proposed for Alternative 90A, are proposed for Alternative 125 along the majority of Empire Corridor South, and coastal zone impacts are not anticipated to occur as this work is expected to be confined to the right-of-way. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River at a new bridge to be constructed within the coastal zone. This will not affect SCFWHs or SASSs, but would involve work within the coastal waterway for a new bridge.

Empire Corridor West/Niagara Branch

This route rejoins the Empire Corridor through Syracuse and Rochester, including the section of track east of Rochester where the Empire Corridor West crosses the coastal zone at Irondequoit Creek (MP 362.92). Impacts to this coastal area would be the same as for Alternatives 90B and 110.

Alternative 125 also includes improvements proposed under Alternative 90A, which include double track along the Niagara Branch that will extend within the coastal zone along the Niagara River.

11. Aquifers

11.1 Existing Conditions

11.1.1 Empire Corridor South

All of the Build Alternatives follow the existing Empire Corridor South for the majority of its length, deviating only in Rensselaer County, where Alternative 125 splits off 1.6 miles south of where the existing Empire Corridor turns to the west. In New York and Bronx Counties, the rail alignment study area does not pass over any U.S. EPA regulated SSAs or any primary or principal aquifers of New York State.

In **Westchester County**, the rail alignment study area crosses over both primary and principal aquifers of New York State. The corridor passes over approximately 0.26 square mile of the Croton-Ossining Primary Aquifer north and south of the Croton-Harmon Station and approximately 0.03 square mile of principal aquifers just north of Peekskill.

In the remaining counties (Putnam, Dutchess, Columbia and Rensselaer counties), the Empire Corridor does not pass over any U.S. EPA regulated SSAs or New York State primary aquifers. However, the corridor does pass over small segments of New York State principal aquifers in all four counties. In **Putnam County**, the rail corridor crosses over 0.09 square feet of principal aquifers just south of Cold Spring. In **Dutchess County**, the rail corridor passes over approximately 0.03 square mile of principal aquifers south of New Hamburg.

There is approximately 0.41 square mile of principal aquifers underlying the rail corridor in **Columbia County**, mainly between Hudson and the northern county line. In **Rensselaer County**, the majority of the 90/110 Study Area passes over 0.80 square mile of principal aquifers and the 125 Study Area passes over 0.83 square mile of principal aquifers.

11.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

There are two aquifer types that underlie the study area in **Albany County**: the Schenectady-Niskayuna SSA (0.43 square mile) and a New York State principal aquifer (0.93 square mile).

The study area passes over the same two aquifer types in **Schenectady County**: the Schenectady-Niskayuna SSA (1.60 square miles) and New York State principal aquifers (0.30 square mile). In addition to these two aquifer types, the study area also crosses over approximately 1.29 square miles of the Schenectady Primary Aquifer. The study area is completely underlain with one or more of the above-mentioned aquifer types in this county.

The study area in **Montgomery County** is completely underlain with approximately 4.47 square miles of New York State principal aquifers. There are no Sole-Source Aquifers or primary aquifers in the study area in this county, or in Herkimer or Oneida counties.

The study area in Herkimer and Oneida Counties is underlain with New York State principal aquifers (2.70 square miles in Herkimer and 1.83 square miles in Oneida). In **Herkimer County**, the majority of the study area is underlain with principal aquifers with the exception of a small area near Little

Falls. In **Oneida County**, principal aquifers underlie the study area for the majority of the eastern portion of the county, until just west of Rome, where no aquifer types are found under the study area. In **Madison County**, there are no aquifers located beneath the study area.

In **Onondaga County**, the study area overlies approximately 1.95 square miles of Baldwinsville Primary Aquifer. Where the railroad enters Syracuse, it passes over this primary aquifer, which extends to just east of the county line at which point it transitions to a New York State principal aquifer (0.20 square mile).

The study area also passes over only New York State principal aquifers in portions of Cayuga and Wayne counties. In **Cayuga County**, there is approximately 0.71 square mile of principal aquifers beneath the study area, mainly in the eastern half of the county. In **Wayne County**, the study area passes over approximately 2.41 square miles of principal aquifers, mainly in the western half of the county.

Monroe and Genesee counties are both underlain with portions of New York State primary aquifers. In **Monroe County**, the study area passes over approximately 0.88 square mile of the Irondegenessee Primary Aquifer, primarily between the eastern county boundary and Rochester. In **Genesee County**, the study area passes over approximately 0.37 square mile of the Batvia Primary Aquifer near the town of Batvia. There is also 0.37 square mile of New York State principal aquifers under the study area in Monroe County.

In **Erie County**, the study area passes over only one aquifer type. There is approximately 0.04 square mile of New York State principal aquifers scattered throughout the county. There are no aquifers beneath the study area in **Niagara County**.

11.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

There are two aquifer types that underlie the study area in **Albany County**: the Schenectady-Niskayuna SSA (0.06 square mile) and a New York State principal aquifer (1.23 square miles).

The study area passes over only New York State principal aquifers in Schenectady, Schoharie, Montgomery, Herkimer, Oneida and Madison counties. In **Schenectady County**, only the eastern portion of the study area passes over 0.59 square mile of principal aquifers. The study area in eastern **Schoharie County** and a small area near the Montgomery County border are underlain with principal aquifers. In total, the study area passes over 0.33 square mile of principal aquifers in Schoharie County.

The study area in **Montgomery County** is underlain with approximately 0.41 square mile of New York State principal aquifers, primarily in the eastern part of the county. Principal aquifers occur sporadically in Herkimer, Oneida, and Madison counties and underlay 0.73 square mile in **Herkimer County**, 0.47 square mile in **Oneida County**, and 0.10 square mile in **Madison County**.

In **Onondaga County**, the study area overlies approximately 1.52 square miles of Baldwinsville Primary Aquifer. Where the railroad enters Syracuse, it passes over this primary aquifer, which continues along the study area to just east of the county line at which point it transitions to a New York State principal aquifer (0.20 square mile).

In **Cayuga County**, there is approximately 0.23 square mile of principal aquifers beneath the study

area, mainly in the eastern half of the county. In **Wayne County**, the study area passes over approximately 0.84 square mile of principal aquifers, sporadically throughout the county. As the corridor approaches the western border of Wayne County, it passes over 0.02 square mile of the Irondongenessee Primary Aquifer. The study area continues over approximately 0.87 square mile of the Irondongenessee Primary Aquifer in **Monroe County**, primarily between the eastern county boundary and Rochester. In addition, there is 0.29 square mile of New York State principal aquifers underneath the corridor in eastern Monroe County.

In Genesee and Erie counties, the study area passes over only one aquifer type: New York State principal aquifers. There is 0.12 square mile of principal aquifers under the study area in **Genesee County** and 0.28 square mile in **Erie County**. There are no aquifers beneath the study area in **Niagara County**.

11.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.12). The potential effects impacts of the Base Alternative and the other Build Alternatives are described in more detail below.

11.2.1 Base Alternative

Empire Corridor South

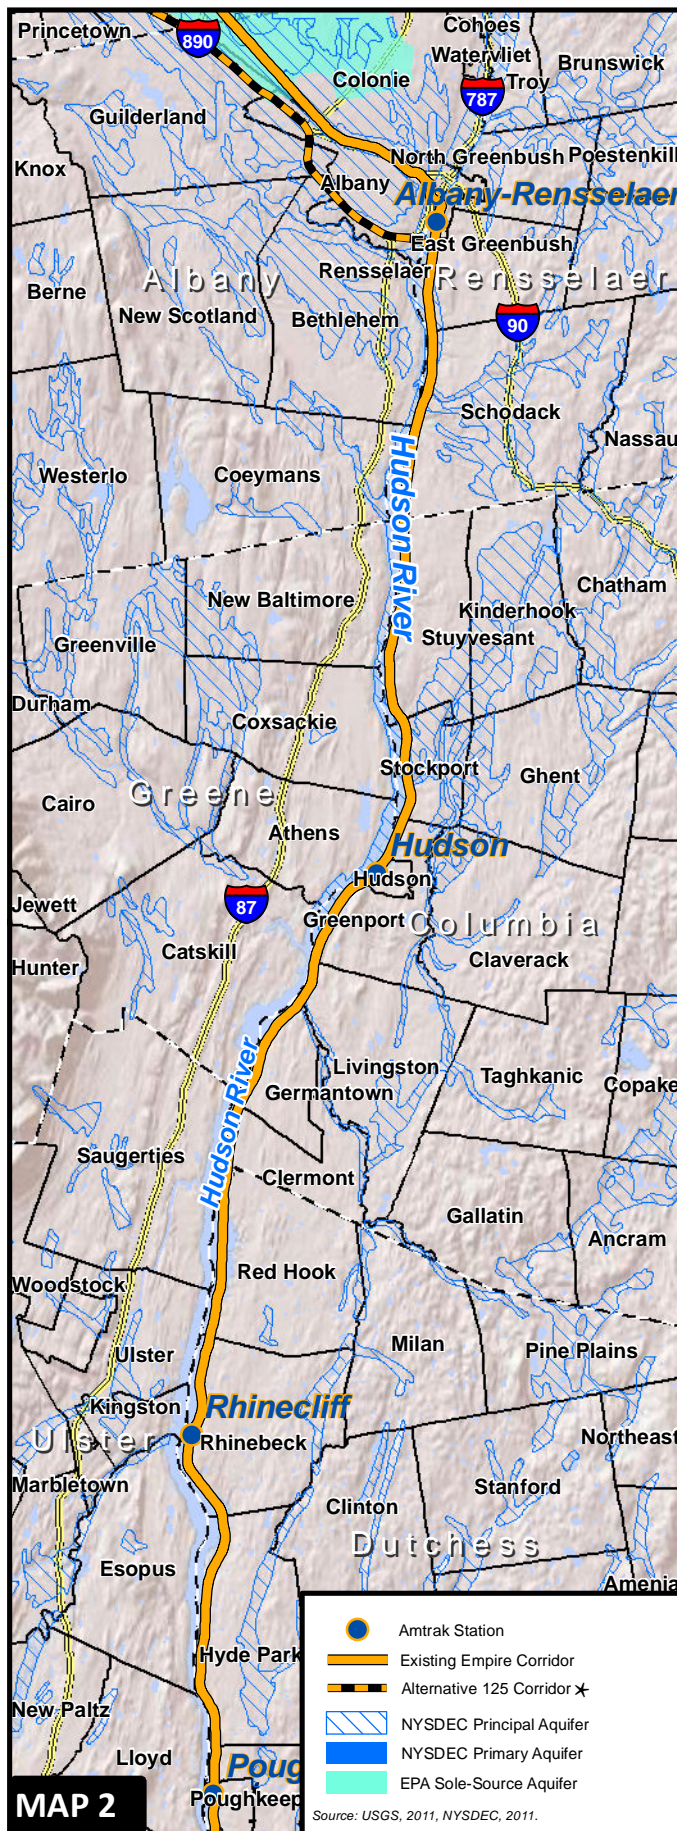

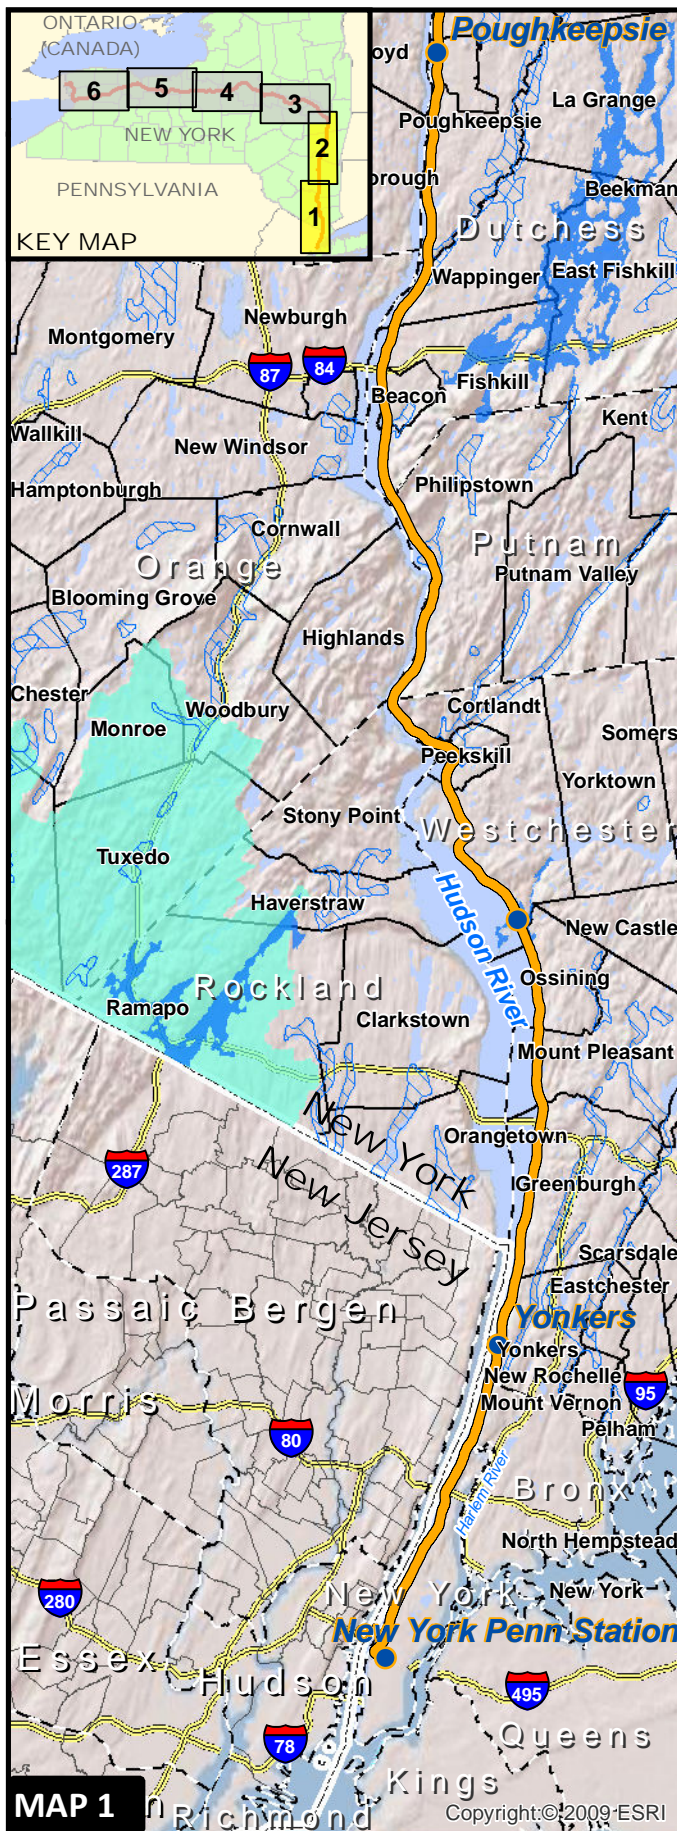

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Tier 1 Draft EIS addressed the potential impacts on aquifers of the eight completed projects included in the Base Alternative. The Base Alternative will maintain weekday service frequencies.

11.2.2 Alternative 90A

Empire Corridor South

Alternative 90A would include construction of four miles of second track through areas of Manhattan and Bronx Counties (MPs 9 to 13). In addition, 1.4 miles of new track would be constructed in Westchester County, extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking (MPs 23 to 25). The proposed improvements in these areas would not pass over any identified aquifers; therefore, impacts from the proposed additional track would not be anticipated.

With Alternative 90A, signal improvements proposed along 43 miles (MPs 32.8 and 75.8) would extend through Westchester (northernmost portion), Putnam, and Dutchess Counties. Proposed improvements would pass over the Croton-Ossining Primary Aquifer (MPs 32 to 35), as well as principal aquifers located north of Peekskill in Westchester County (MPs 41 to 43), south of Cold Spring in Putnam County (MPs 51 to 52), and south of New Hamburg in Dutchess County (MP 65). Improvements would primarily occur within the existing right-of-way, and would likely not include a change to the existing water quality and impervious surfaces; therefore, the proposed signal improvements would have minimal direct and/or indirect impacts to the identified aquifers in these areas.

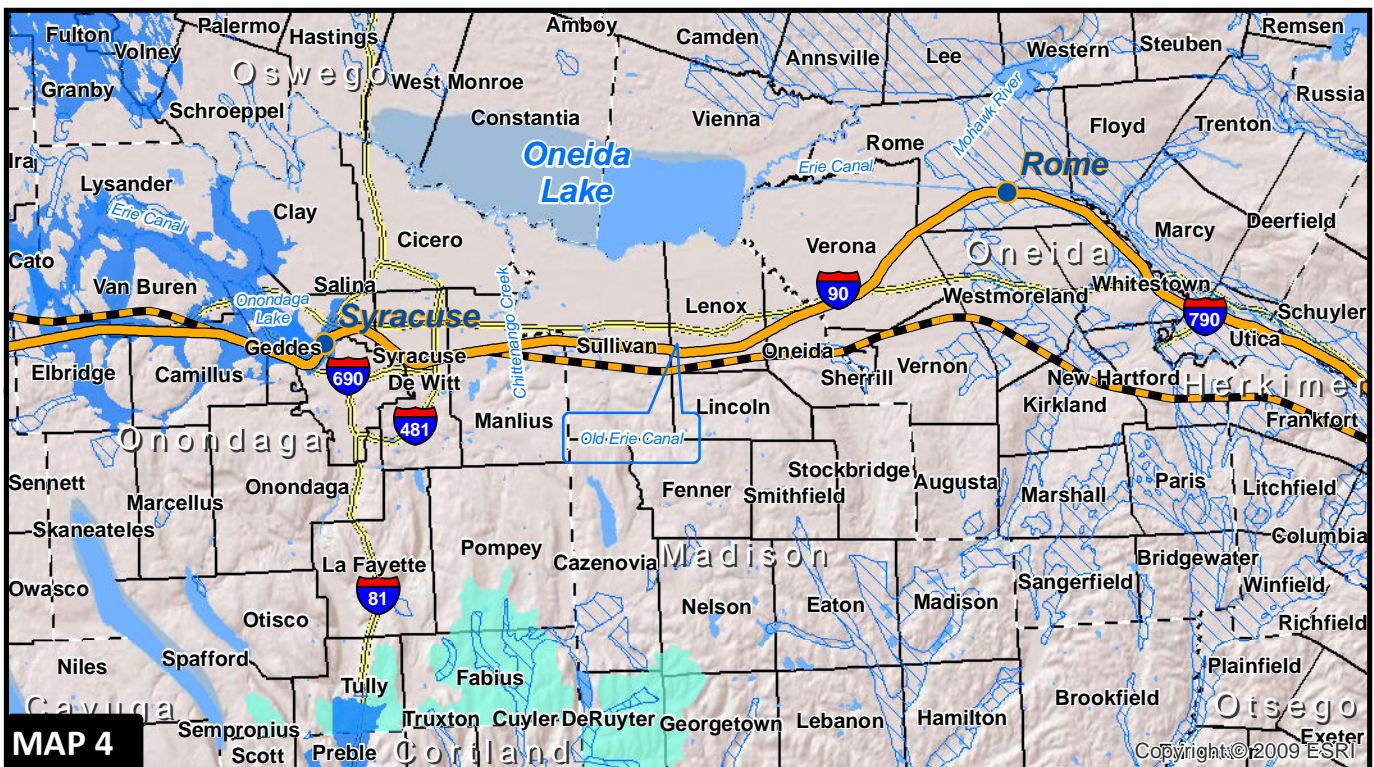

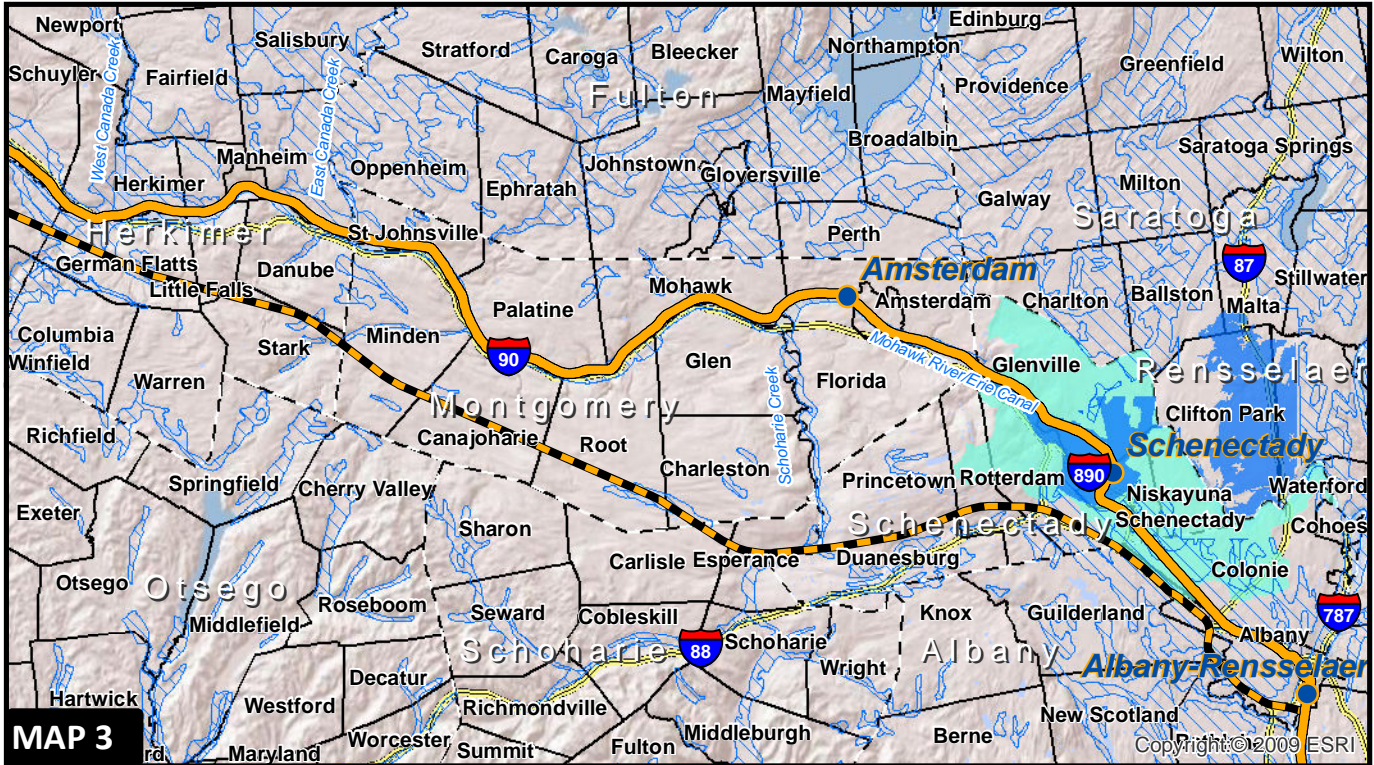

*Alt. 125 as shown is a potential corridor used to analyze the potential operating characteristics, environmental impacts and cost for this speed (125 mph) threshold.

Aquifers
Exhibit G-15

Tier 1 EIS
High Speed Rail
Empire Corridor Program

*Alt. 125 as shown is a potential corridor used to analyze the potential operating characteristics, environmental impacts and cost for this speed (125 mph) threshold.

Aquifers
Exhibit G-15

Tier 1 EIS
High Speed Rail
Empire Corridor Program

In addition, 10 miles of new third track (MPs 53 to 63) and improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) would be located within urban areas in Dutchess County. The proposed improvements in these areas would not pass over any identified aquifers; therefore, impacts from the proposed additional track would not be anticipated.

North of Poughkeepsie and south of Albany-Rensselaer Station (MPs 75.8 to 140), proposed improvements would include rock slope stabilization (MPs 105 to 130) and three new control points (CP 82, CP 99, and CP 136), as well as station improvements at Rhinecliff Station (MP 89) and Hudson Station (MP 113). New York State principal aquifers would underlie three small areas along this segment of track (near MPs 108, 111, and 135). The area underlying the Hudson River is designated as a New York State principal aquifer, and portions of the track would pass over, or would be located immediately adjacent to, the aquifer. These improvements would occur largely within the right-of-way and would not include substantial impacts outside the right-of-way. Although proposed improvements such as rock slope stabilization may potentially increase impervious surfaces, depending on the design, this would have minimal or no impacts on underlying aquifers.

In addition, Alternative 90A would include the replacement of the Livingston Avenue Bridge, which would extend over the Hudson River between the cities of Rensselaer and Albany. The area underlying the Hudson River is designated as a New York State principal aquifer. Depending on the construction and excavation depths and the design of the proposed bridge replacement, associated construction activities in this area would have the potential to directly and/or indirectly impact the aquifer, but these impacts would be temporary in nature. Potential impacts from this work could include the potential for discharges from excavation affecting groundwater quality.

Empire Corridor West

With Alternative 90A, track improvements would include approximately 10 miles of third track between MPs 169 and 178.5, and Amsterdam Station improvements along the west end of this segment. MP 169 is located on the westernmost edge of the Schenectady Primary Aquifer; the remainder of the segment, including the Amsterdam Station, would be generally located within a principal aquifer that generally underlies the Mohawk River. Adding rail ties and ballast for the new track would involve minimal impacts to underlying aquifers, as areas affected comprise a relatively small proportion of the entire recharge area; therefore, the proposed improvements would have minimal direct and/or indirect impacts to the above-mentioned primary and principal aquifers.

Upgrades to interlockings and automatic block signals would also occur at three control points in the Cities of Amsterdam, Utica, and Rome (CP 175, CP 239, and CP 248, respectively). The control points would be located within the boundaries of the principal aquifer, which would generally underlie the Mohawk River. Proposed improvements would primarily occur within the existing right-of-way, and would not likely include a change to the existing water quality and impervious surfaces.

Alternative 90A would include Syracuse Station track improvements (MPs 290 to 294), Rochester Station track and platform improvements (MPs 368 to 373), and third track improvements along 11 miles (MPs 373 to 382) west of the station. Where the railroad enters the City of Syracuse, it would pass over the Baldwinsville Primary Aquifer. Adding rail ties and even ballast for the new track would involve minimal impacts to underlying aquifers. Depending on the construction and excavation depths associated with the proposed station and platform improvements, station improvements could have the potential to minimally impact the Baldwinsville Primary Aquifer. The

improvements in the City of Rochester west of the station, including the addition of a third track along 11 miles located largely west of the City of Rochester (MPs 382 to 393) and extending into Genesee County would not be located over an aquifer; therefore, impacts would not be anticipated in this area.

11.2.3 Alternative 110

Empire Corridor South

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, is proposed and additional impacts to underlying aquifers and/or adjoining surface waterways would not be anticipated to occur.

Empire Corridor West/Niagara Branch

With Alternative 110, track realignments and third and fourth track improvements would traverse the aquifer and surface waterways as described in Alternatives 90A and 90B. No other impacts other than those described above for Alternatives 90A and 90B would be anticipated for Alternative 110.

11.2.4 Alternative 125

Empire Corridor South

However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. The area underlying the Hudson River is designated as a New York State principal aquifer; therefore, depending on the construction and excavation depths, construction activities in this area may have the potential to temporarily impact the aquifer.

Empire Corridor West/Niagara Branch

Construction of a new rail corridor could require more excavations and drainage alterations and therefore would involve a higher potential to directly impact existing groundwater resources than the other alternatives. These actions may include new bridge construction; therefore, there would be the potential for construction of bridge foundations to temporarily or possibly even permanently impact aquifers from the construction of Alternative 125. The sections below describe areas where the proposed railroad alignment would be located above an aquifer, and therefore have the potential to impact these aquifers.

This route covers 126 miles on new alignment between Rensselaer County and a point 8.5 miles east of Syracuse Station. Alternative 125 would extend through Albany and Schenectady Counties over a distance of 20 miles, following the New York State Thruway (I-87/I-90) over most of this distance. This segment of the alignment would extend over New York State principal aquifers (approximately MPs QH147 to QH162) and the Schenectady-Niskayuna Sole Source Aquifer (approximately MPs QH152 to QH153).

In Schoharie and Montgomery Counties, the alignment would extend over New York State principal aquifers (approximately MPs QH173 to QH177 and MPs QH180 to QH185).

In Herkimer and Oneida Counties, Alternative 125 would extend over New York State principal

aquifers in several small segments of the alignment (approximately MPs QH202, QH204, QH212, QH215, QH217 to QH220, QH224 to QH226, QH228 to QH230, QH235 to QH236, QH240 to QH241, and QH249 to QH250). In Madison County, the proposed track would extend over a New York State principal aquifer on the easternmost portion of the county (MP QH250).

In Onondaga County, the alignment would merge with the existing Empire Corridor through the City of Syracuse; any proposed improvements in this area would have the same impacts as stated in the 90A/90B/110 Alternatives. Alternative 125 would extend off the existing Empire Corridor on the western city limits and passes over several segments of the Baldwinsville Primary Aquifer (MPs QH285 to QH294). The alignment would then extend through Cayuga County, where only small portions (MPs QH304, QH305, and QH306) overlay New York State principal aquifers.

In Wayne County, Alternative 125 would extend across several small segments of New York State principal aquifers primarily along the eastern portion of the county (MPs QH313 to QH315, QH316, QH317.5, QH322, QH323, QH324.5, QH325.5, QH327, QH328.5, QH331.5, QH332.5, QH336 to QH337, QH340 to QH341, and QH342). The Ironodgenesee Primary Aquifer is located at the western county boundary (MP QH342). As the alignment extends through Monroe County, it would pass over the Ironodgenesee Primary Aquifer (MPs QH342 to QH345) until merging with the existing Empire Corridor east of the City of Rochester. The alignment would remain on the existing Empire Corridor to the east of the city; no other aquifers would be encountered in the remainder of Monroe County.

In Genesee County, with the exception of a small segment of New York State principal aquifer (approximately MP QH399), the Alternative 125 alignment would not pass over any aquifers. In Erie County, the alignment would extend over small segregated areas (MPs QH408 and QH409) underlain by New York State principal aquifers. The alignment would then merge with the existing Empire Corridor; no other aquifers would be encountered in either Erie or Niagara Counties.

12. General Ecology and Wildlife Resources

12.1 Existing Conditions

12.1.1 Ecological Zones

Along the 464-mile Empire Corridor 90/110 Study Area and the 450-mile 125 Study Area, the corridor centerlines transition through areas of urban, suburban, and rural habitats. Five ecological zones (Zones B, C, D, F, and H), as documented by the NYSDEC, are identified within each corridor study area (refer to Exhibit G-17). The topography ranges from low-elevation floodplains to steep hills, and vegetation is generally considered part of the north hardwood vegetation zone.⁴

The ecological zones are described below:

- **Zone B—Great Lakes Plain (major habitat):** This ecozone along Empire Corridor West and Niagara Branch comprises almost half of the study area. The two subzones are:
 - **Drumlin:** This zone is situated in the elm-red-maple northern hardwood natural vegetation zone. Structurally, it is a plateau with horizontal rock formations. The Drumlin subgroup has elongated hills that formed from glacial deposits.

⁴ NYSDEC, "EcoZones," Accessed June 2011. <<http://www.nysgis.state.ny.us/gisdata/inventories/details.cfm?DSID=1131>>.

- **Erie Ontario Plain:** This zone is situated in the elm-red-maple northern hardwood natural vegetation zone. Only about one-fifth of the land is forested. Structurally, it is a plateau with horizontal rock formations.
- **Zone C—Mohawk Valley (major/minor habitat):** The Mohawk Valley is in the northern hardwood natural vegetation zone. Nearly all the forest is on farms. Terrain consists of either rolling plains with gentle slopes, or hills with moderate slopes.
- **Zone D—Hudson Valley (major habitat), Central Hudson (minor habitat):** The Hudson Valley is part of the oak-northern hardwood natural vegetation zone. Pitch pines and scrub oaks are found in the sand plains in the Albany vicinity. A complex of hills and terraces are underlain with highly folded sedimentary rock.
- **Zone F—Hudson Highlands (major/minor habitat):** This zone is in the oak natural vegetation zone. Young stands of pioneer hardwoods and oaks are most common. This zone is continuous with the New Jersey Highlands to the south. The terrain is rolling to steep and is rough and stony.
- **Zone H—Manhattan Hills (major/minor habitat):** The Manhattan Hills are considered part of the oak and the oak-northern hardwood natural vegetation zones. Pioneer hardwoods and oaks are most common. The terrain is rolling to hilly.

12.1.2 Threatened and Endangered Species/EFH/Natural Heritage Significant Natural Habitats

Section 4.13 of the Tier 1 Final EIS describes the federally and state listed species occurrences by county. Exhibit G-18 and Exhibit G-19 present the list of federally and state-endangered and threatened species documented or suspected to potentially occur within the one-mile-wide study area for both the 90/110 mph and the 125 mph study areas. These totals include occurrences for species-specific screening distances for NYNHP within the ½ mile study buffer (1 mile around bald eagle nests, 0.81 mile of Blanding's turtle locations, 1.5 miles of timber rattlesnake locations, 2.5 miles from Indiana bat locations, 1.5 miles of non-wintering Northern long-eared bat locations and 5 miles from NLEB hibernacula). The totals also include species last documented before 1980 (historical records), or for which relatively precise locations or recent occurrences are not known or confirmed.

Section 4.13 of the Tier 1 Final EIS describes the thirteen species designated by the National Marine Fisheries Service as Essential Fish Habitats protected under the Magnuson-Stevens Fisheries Conservation and Management Act. Exhibit G-20 presents the life stages of the EFH species in the study area counties.

Section 4.13 discusses the distribution of significant natural communities located in the vicinity of the study area designated by the New York Natural Heritage Program, shown in Exhibit G-21.

Exhibit G-17—New York State Ecological Zones Located Within the Study Area

Zone	Habitat		Location	Acres in Study Area	
	Major	Minor		90/110 Study Area	125 Study Area
Zone B	Great Lakes Plain	Drumlin	Monroe	3,353	3,130
			Wayne	23,732	22,386
			Cayuga	7,344	7,087
			Onondaga	9,403	9,550
		Erie-Ontario Plain	Niagara	8,534	8,534
			Erie	19,870	21,524

Zone H	Manhattan Hills	Manhattan Hills	Rockland	48	48
			Westchester	18,036	18,036
			Bronx	878	878
			New York	4,195	4,195

Note: The 90/110 Study Area is used for analysis of Alternatives 90A, 90B, and 110 and consists of the existing 464-mile long Empire Corridor alignment. The 125 Study Area is used for analysis of Alternative 125 and consists of portions of the existing Empire Corridor and new alignment and is 450 miles long. The study area width is defined as being within a half-mile of the corridor centerline.

12.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.13). The potential effects impacts of the Base Alternative and the other Build Alternatives are described in more detail below.

12.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed. The Base Alternative will maintain weekday service frequencies. The Tier 1 Draft EIS addressed the potential impacts on ecology and wildlife of the eight projects included in the Base Alternative. Work associated with this alternative would not likely have resulted in impacts caused by habitat fragmentation, since track improvements were located largely within the existing rail beds or railroad rights-of-way.

12.2.2 Alternative 90A

New tracks proposed under this alternative would not extend more than 15 feet laterally from the current mainline tracks. As such, habitat fragmentation is not anticipated since work would be conducted within the right-of-way. Additional station improvements proposed under this alternative would be located within existing building and track infrastructure and would not likely impact ecological resources.

Empire Corridor South

Alternative 90A would include construction of four miles of second track through urbanized areas of Manhattan (SRP-1, MPs 9 to 13), and 1.4 miles of new track extending under the Tappan Zee Bridge (SRP-2) for the Tarrytown Pocket Track/Interlocking. There are several records of sensitive species and Essential Fish Habitat within a half-mile of the corridor centerline in the vicinity of these proposed work locations, primarily occurring in the Hudson River. Construction could affect aquatic species if construction work is conducted within or indirectly affects the Hudson River.

Ten miles of new third track (SRP-3, MPs 53 to 63) would be installed within or adjacent to a bird conservation area and areas of known occurrences of significant natural communities and protected plant and wildlife populations. Improvements at the Poughkeepsie Yard/Storage Facility (ES-13, MPs 71 to 75.8) and rock slope stabilization north of the Poughkeepsie station (ES-04, five locations between MPs 105.3 to 130, one location at MP 119, and 4 locations at MPs 128.1-130) would include work in areas where there is a potential for the presence of protected species and significant natural communities to occur within a half-mile of the corridor centerline. In addition, rock slope stabilization near MP 130 would include work near the Shodack Island bird conservation area. Work in the above-mentioned areas that may involve tree clearing or disturbance of terrestrial or aquatic habitats may impact nesting bird habitat, protected species or significant natural communities, and any work conducted over or directly adjacent to the Hudson River would have the potential to impact aquatic resources. However, work in these areas would occur within the existing right-of-way thereby minimizing the potential for ecological impacts.

Alternative 90A would include the replacement of the Livingston Avenue Bridge (ES-15) over the Hudson River. There are records of protected resources at this location, and work there would have the potential to impact EFH, protected aquatic species, or other aquatic habitat through temporary or permanent direct habitat disturbance.

Empire Corridor West/Niagara Branch

Track improvements along the Empire Corridor West/Niagara Branch would include 10 miles of third track between MPs 169 and 179 (EW-14a), and Amsterdam Station improvements along the west end of this segment (EIS-1, MP 177.6). Additionally, installation of a third track and access road at approximately MP 167 would pass through an area that is currently vegetated. There is one known protected resource with a potential for occurrence within a half-mile of the corridor centerline along this stretch of tracks. However, any vegetation removal would have the potential to impact terrestrial habitat, such as nesting birds. Updates to three control points (EW-05, MPs 175, 239 and 248) would not likely impact ecological resources because work would be performed in existing right-of-way thereby minimizing the potential for ecological impacts.

Alternative 90A would include Syracuse Station track improvements (EIS-6, MPs 290 to 294), addition of a third track along 11 miles located largely west of the designated urban area around Rochester (EW-20, MPs 382 to 393), and third track improvements along 11 miles (EW-16, MPs 373 to 382) west of the station. These are primarily urban areas, and there are four known occurrences of state-listed species (including one federally/state endangered species) and one potential/historic (pre-1980) occurrence of a state-endangered species within a half-mile of the corridor centerline at the proposed work locations. Additionally, these sections of railroad would extend in close proximity to Riga Swamp and the Three Rivers Wildlife Management Area/Three Mile Bay WMA.

Station improvements at the Buffalo-Depew Station (EIS-10, MPs 429 to 433) would involve potential disturbance to vegetated areas within the current station footprint. Although there are no known occurrences of protected plant, wildlife or habitats in these areas, this work could impact nesting birds through the removal of vegetation. Double track (EW-17, MPs QDN17 to QDN23.2) along the Niagara Branch and Niagara Falls Maintenance Facility and track improvements (EW-18 and EIS-12, MPs 25 to 28) would not involve work outside of the existing right-of-way, and, therefore, impacts to ecological resources would be unlikely. However, in areas adjoining the right-of-way, sightings of two species of state-listed birds have occurred at one location.

12.2.3 Alternative 110

Due to an increase in Maximum Authorized Speed and an even greater increase in track realignments outside of the right-of-way proposed with Alternative 110, impacts such as habitat encroachment would be more likely to occur than with Alternatives 90A and 90B. The total number of sensitive resources identified as potentially occurring within a half-mile of the proposed physical improvement areas for Alternative 110 would be the same as for Alternative 90B. Alternative 110 would have a higher likelihood of impacts to ecological resources than Alternatives 90B due to the increase in work outside of the right-of-way and existing track bed.

Empire Corridor South

No additional work within Empire Corridor South, other than for Alternative 90A, is proposed, and

there would be no potential for additional impacts to ecological resources in this area for Alternative 110.

Empire Corridor West/Niagara Branch

In areas identified for a dedicated fourth track under Alternative 110 (MPs 174 to 184, 218 to 229, 235 to 239, 249 to 259, 310 to 320, and 388 to 399), there are two records of sensitive natural communities and five records of protected species with a potential for occurrence within a half-mile of the corridor centerline. Within the stretch of tracks identified for a dedicated third track (MP 159 and MP 432) there are an additional 17 species with a potential to occur within a half-mile of the corridor centerline. In addition, Moss Island (a NNL) and Montezuma Marsh (a NNL and bird conservation area), and seven significant natural communities occur within this stretch of tracks. Therefore, construction activities associated with the addition of third and fourth tracks that would result in vegetation clearing or habitat disturbance would have the potential to impact ecological resources.

Of the five stations proposed for upgrades, there is only one record of a sensitive resource within a half-mile of the proposed work areas at the Syracuse station. It would be unlikely that station improvements at this location would result in impacts to sensitive resources unless project designs extend beyond the existing developed lands. There would be 14 locations where realignment of adjoining roadways could result in impacts to ecological resources, but these locations would be better defined in a Tier 2 assessment.

12.2.4 Alternative 125

Ecological resources could be impacted directly by new construction or improvements to existing infrastructure and habitat fragmentation or indirectly through increases in travel speeds and train frequency throughout the Alternative 125 corridor. Impacts would be more likely to occur than with Alternatives 90B, 110, or 90A alone. The total number of protected habitats and sensitive resources identified as having a potential for occurrence within a half-mile of the proposed alignment for Alternative 125 is greater than the other alternatives.

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. This work would have the potential to impact ecological resources such as aquatic species and Essential Fish Habitat in this portion of the Hudson River with construction of a new river bridge.

Empire Corridor West/Niagara Branch

Alternative 125 would involve construction of a total of 236 miles of track on a new alignment. Installation of the tracks proposed for the new alignment would have the potential to impact terrestrial and aquatic habitats. In addition to the ecological resources that may be impacted by implementation of Alternative 90A, Alternative 125 could affect all of the bird conservation areas, NNLs, sensitive natural communities, and protected species identified in the “Existing Conditions” for the 125 Study Area. The impacts could be through habitat conversion and habitat fragmentation.

13. Critical Environmental Areas State Environmental Quality Review Act

13.1 Existing Conditions

The State Environmental Quality Review Act designate protections for Critical Environmental Areas (CEAs). Within a half-mile of the corridor centerline for both the 90/110 and the 125 Study Areas, there are three CEAs in Westchester County, three in Dutchess County, three in Monroe County and four in Erie County. Section 4.14 of the Tier 1 Final EIS describes these CEAs and their occurrences relative to project alternatives.

13.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.14). The potential effects impacts of the Base Alternative and the other Build Alternatives are described in more detail below.

13.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed. The Base Alternative will maintain weekday service frequencies. The Tier 1 Draft EIS addressed the potential impacts on CEAs of the eight projects included in the Base Alternative.

13.2.2 Alternative 90A

Proposed construction work for Alternative 90A (MPs 373 to 393) would be within the existing right-of-way and would be unlikely to directly impact these CEAs.

Empire Corridor South

Alternative 90A would include:

- Construction of 1.4 miles of new track, extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking and signal improvements proposed along 43 miles (MPs 32.8 and 75.8). Both of these projects would occur in the vicinity of the “Hudson River” CEA, designated to extend along the entire length of the Hudson River within Westchester County, from approximately MP 14 to MP 45.
- The “County and State Park Lands” CEA includes lands that intersect or run adjacent to the rail right-of-way at MP 17 (Untermeyer Park), MP 26 (Kingsland Point County Park and Devries Park), MP 27 (Peabody Field), MP 28 (Rockwood Hall State Park) and MP 37 (Oscawana County Park), although the only changes at most these locations would be the additional train trips.
- The “Croton Point Park” CEA intersects the rail right-of-way at approximately MP 33.
- Direct impacts would not be anticipated to the “Hudson River” and “County and State Park Lands” CEAs since work would occur primarily within the existing right-of-way and would only extend north from MP 33, and would be unlikely to change the unique character of these CEAs. Along this section, 10 miles of new third track (MPs 53 to 63) and improvements at the Poughkeepsie

Yard/Storage Facility (MPs 71 to 75.8) will not affect CEAs.

- North of Poughkeepsie and south of Albany-Rensselaer Station (MPs 75.8 to 140), proposed improvements in close proximity to CEAs include rock slope stabilization (MPs 105 to 130) and three new control points (CP 82, CP 99, and CP 136). Since work will be confined to the right-of-way, no changes to these CEAs are anticipated.

Empire Corridor West/Niagara Branch

The “Aquifer Overlay Zone” CEA in Schenectady County is designated “to conserve, improve, and protect natural resources.” There would be no proposed construction work for Alternative 90A in this CEA.

With Alternative 90A, track improvements would include approximately 10 miles of third track between MPs 169 and 178.5, and Amsterdam Station improvements along the west end of this segment. Additionally, upgrades to interlockings and automatic block signals at three control points (CP 175, CP 239, and CP 248) are proposed. These improvements would not occur in the vicinity of or impact CEA areas.

In Onondaga County, a CEA is designated by the Town of Camillus as “Portions of Nine Mile Creek” at approximately MP 297. There would be no proposed construction work for Alternative 90A in this CEA.

There are several designated CEAs that are located in the vicinity of proposed improvements and increased train frequency in Monroe County: “Land within 100 feet of the Genesee River, Erie Canal, Lake Ontario or River Gorge except in manufacturing industrial zone,” “Lands with slopes greater than 15 percent,” “Heavily wooded land,” and “Drainage systems designated on official street map.” In addition, proposed improvements under Alternative 90A would occur in the vicinity of an area meeting the City of Rochester CEA definition of “Areas zoned ‘open space’” at the western city limit.

Station improvements at the Buffalo-Depew Station (MPs 429.5 to 432.5) would occur in the general vicinity of three CEAs designated by the Town of Cheektowaga. All three of the Town of Cheektowaga CEAs are no closer than 3,000 feet from the rail right-of-way at MP 433 and are separated from the railroad by urban lands. Although some work outside of the existing right-of-way at MP 433, these CEAs would not likely be impacted due to their distance from the proposed work.

13.2.3 Alternative 110

Empire Corridor South

No additional work is proposed within Empire Corridor South, other than that proposed for Alternative 90A, and additional CEA impacts would not be anticipated.

Empire Corridor West/Niagara Branch

Third and fourth track improvements and increased train frequency would occur in the vicinity of the same CEAs in Schenectady, Onondaga, Monroe and Erie Counties as mentioned in Alternative 90B. The majority of these CEAs would not cross the proposed improvements; however, the program area would pass directly through “Portions of Nine Mile Creek” and “Land within 100 feet of the

Genesee River, Erie Canal, Lake Ontario or River Gorge except in manufacturing industrial zone”. Work in these areas would occur within the existing right-of-way and would be unlikely to impact these CEAs.

13.2.4 Alternative 125

Empire Corridor South

No additional work is proposed within Empire Corridor South, other than that proposed for the Alternative 90A, and additional CEA impacts would not be anticipated.

Empire Corridor West/Niagara Branch

The new Alternative 125 track alignment would fall within the vicinity of the Town of Rotterdam’s “Aquifer Area Overlay Zone” CEA. However, the CEA and proposed track alignment would be approximately a half-mile away from each other and would be separated by urban lands. No impacts to this CEA would be anticipated. All portions of the Alternative 125 track alignment that would not overlap with Alternatives 90A, 90B, and 110 would not be in the vicinity of any designated CEA, and therefore no additional impacts would be anticipated.

14. Historic and Cultural Resources

14.1 Existing Conditions

14.1.1 Archaeology

Historic Context

The Paleo Indian Period (c. 10,500 B.C. - c. 8000 B.C.) represents the earliest known human occupation of the land area that now known as New York. Approximately 14,000 years ago the Wisconsin Glacier retreated from the area leading to the emergence of a cold dry tundra environment. Sea levels were considerably lower than modern levels during this period.⁵ For many years, archaeologists characterized Paleo Indians as “big game hunters;” however, more recent studies have redefined how we think of these early Americans. The recovery of fish scales, charred nutshells and plant and animal remains, has resulted in a changing picture of the Paleoindian diet, settlement, and subsistence patterns suggesting a complex and flexible lifestyle among the earliest Americans. The highly mobile nomadic bands of this period specialized in hunting large game animals such as mammoth, moose-elk, bison, and caribou and gathering plant foods. It has been theorized that the end of the Paleo-Indian Period arose from the failure of over-specialized, big-game hunting (Snow 1980:150-157). Based on evidence from excavated Paleo-Indian sites in the Northeast, there was a preference for high, well-drained areas in the vicinity of streams or wetlands.⁶ Sites have also been found near lithic sources, rock shelters and lower river terraces.⁷

During the Archaic Period (c. 8000 B.C. - 1000 B.C.) a major shift occurred in the subsistence and settlement patterns of Native Americans. Archaic period peoples still relied on hunting and gathering for subsistence, but the emphasis shifted from hunting large animal species, which were becoming unavailable, to smaller game and collecting plants in a deciduous forest. The settlement pattern of the Archaic people consisted of small bands that occupied larger and relatively more permanent habitations sites along waterways.⁸ Typically such sites are located on high ground overlooking water courses. This large period has been divided up into four smaller periods, the Early, Middle, Late and Terminal Archaic.

The environment during the Early Archaic (c. 8000 B.C. - 6000 B.C.) displayed a trend toward a milder climate and the gradual emergence of a deciduous-coniferous forest.⁹ The large Pleistocene fauna were gradually replaced by modern species such as elk, moose, bear, beaver, and deer. New species of plant material suitable for human consumption became abundant. The increasing diversification of utilized food sources is further demonstrated by a more complex tool kit, including bifurcated or basally notched projectile points and a wide variety of plant processing equipment such as grinding stones, mortars and pestles. A population increase took place during the Middle Archaic Period (c. 6000 - c. 4000 B.C.), which is characterized by a moister and warmer climate and the emergence of an oak-hickory forest. The settlement pattern during this period displays specialized sites and increasing cultural complexity. The exploitation of the diverse range of animal and plant resources continued with an increasing importance of aquatic resources such as mollusks and fish.¹⁰ In addition to projectile points, grinding stones, mortars, and pestles, are found in Middle Archaic period sites.¹¹ Late Archaic people (c. 4000 - c. 1000 B.C.) were specialized hunter-gatherers who seasonally exploited a variety of upland and lowland settings. As the period progressed, the dwindling melt waters from disappearing glaciers and the reduced flow of streams and rivers promoted the formation of swamps and mudflats, congenial environments for migratory waterfowl, edible plants and shellfish. The new mixed hardwood forests of oak, hickory, chestnut, beech and elm attracted white-tailed deer, wild turkey, moose and beaver. The large herbivores of the Pleistocene were rapidly becoming extinct and the Archaic Indians depended increasingly on smaller game and the plants of the deciduous forest. The tool kit of these peoples included new projectile point types as well as milling equipment, stone axes, and adzes.¹² During the Terminal Archaic Period (c. 1700 B.C. - c. 1000 B.C.), native peoples developed new and radically different broad bladed projectile points (Boesch 1994a).

The Woodland Period (c. 1000 B.C. - 1600 A.D.) is generally divided into Early, Middle and Late Woodland on the basis of cultural materials and settlement-subsistence patterns. The Early Woodland was essentially a continuation of the tool design traditions of the Late Archaic. During this period, clay pottery vessels gradually replaced the soapstone bowls. Cord marked vessels became common during the Middle Woodland Period (c. A.D. 1 to c. 1000 A.D.). The Early and Middle Woodland periods display significant evidence for a change in settlement patterns toward a more sedentary lifestyle. The discovery of large storage pits and larger sites in general has fueled this theory. Some horticulture may have been utilized at this point but not to the extent that it was in the Late Woodland period. In the Late Woodland period (c. 1000 A.D. - 1600 A.D.), triangular projectile

points such as the Levanna and Madison types, were common throughout the Northeast.¹³ Made both of local and non-local stones, these artifacts bear witness to the broad sphere of interaction between groups of native peoples in the Northeast. This period saw the emergence of collared ceramic vessels, many with decorations. Horticulture flourished during this period and with it, the appearance of large, permanent or semi-permanent villages. Plant and processing tools became increasingly common, suggesting an extensive harvesting of wild plant foods. Maize cultivation may have begun as early as 800 years ago. The bow and arrow, replacing the spear and javelin, pottery vessels instead of soap stone ones, and pipe smoking, were all introduced at this time. A semi-sedentary culture, the Woodland Indians moved seasonally between villages within palisaded enclosures and campsites, hunting deer, turkey, raccoon, muskrat, ducks and other game and fishing with dug-out boats, bone hooks, harpoons and nets with pebble sinkers. Their shellfish refuse heaps, called "middens," sometimes reached immense proportions.¹⁴

Methodology

As noted in Section 4.15.2, information concerning the location and character of previously-identified archaeological sites in the direct Areas of Potential Effects (APEs) was collected through a review of the site files of SHPO and NYSM. Section 4.15.3 identifies the number and type of sites in each county in the direct APEs for the 90/110 Study Area and the 125 Study Area. To assist in the Tier 1 analysis, the sites were grouped into various basic site type categories developed in coordination with SHPO. NYSM sites have been divided into point and polygon sites. In general, NYSM polygon sites are mapped as polygons and typically denote sites that were identified less recently and whose boundaries are not clearly defined. NYSM point sites were typically identified more recently.

The previously-identified Native American sites in the direct APEs were grouped into the following site type categories:

- Burial Site/Mound,
- Campsite/Workshop,
- Cave/Rockshelter,
- Habitation/Village Site,
- Midden,
- Other,
- Pictograph/Petroglyph,
- Quarry,
- Stray Find/ Traces of Occupation,
- Trail,
- Unknown.

Historic-period sites types located in the direct APEs were fit into the following broad historic site categories:

- Cemetery/Burial/Funerary,
- Domestic,
- Industrial/Commercial,
- Maritime,
- Transportation/ Infrastructure,
- Other,
- Unspecified/Unknown.

Direct APE: 90/110 Study Area

A total of 166 previously-identified archaeological sites have been identified within the direct APE for the 90/110 Study Area that extends along the Empire Corridor South/West and the Niagara

¹⁴ Ritchie, William A. The Archaeology of New York State (Revised Edition). Harrison: Harbor Hill Books. 1980, 80, 267.

Branch (see Exhibit G-22). Of these sites, 47 are SHPO archaeological sites, 117 are NYSM sites (13 point sites and 104 polygon sites), and two are sites identified by the Oneida Nation (Sites 1 and 2). There are a total of 36 burial/habitation sites.

Direct APE: 125 Study Area

A total of 126 previously-identified archaeological sites have been identified within the direct APE for the 125 Study Area that extends along the Empire Corridor South/West and the Niagara Branch. Of these, 27 are SHPO archaeological sites, 96 are NYSM sites (8 point sites and 88 polygon sites), and three are sites identified by the Oneida Nation (Sites 3 through 5). There are a total of 27 burial/habitation sites.

14.1.2 Architectural Resources

Historic Context

The earliest transportation networks in the State of New York consisted of waterways and Native American trails. The Hudson River was a natural highway for the region, and in the 1620s the Dutch established New Amsterdam at its mouth and built Fort Orange at the mouth of its principal tributary, the Mohawk River. Trading posts were defined between these two points and the surrounding area became known as the province of New Netherland. In 1664, New Netherland became the province of New York under British establishment.

Ferries, canals, and railroads have all been important to the development of transportation in New York State. Canals and railroads dominated transportation development in the first half of the 19th century. Efficient transportation was an important means of getting goods to market and a major factor in the value of land in different parts of the state. The Erie Canal, completed in 1825, spurred the westward migration of American settlers, opened the only trade route west of the Appalachians, and secured New York as the preeminent commercial city in the United States.¹⁵ As a result of the increase in trade and traffic, the cities of Albany, Syracuse, Rochester, and Buffalo were formed. During the same period, the first railroad company in New York State, the Mohawk and Hudson, began operation between Albany and Schenectady in 1831.¹⁶ The success of this railroad sparked a rail boom. Money flowed into lines that linked other Erie Canal towns, and within a decade through service was available from Albany to Buffalo.¹⁷ In 1837, the Buffalo & Niagara Falls Railroad also began operations, and the 22-mile stretch became a three-mile journey powered by a wood-stoked steam locomotive. In 1852, the railroad developed tracks west of the Erie Canal, and in December of 1853, the Buffalo & Niagara Falls railroad was leased to the newly founded New York Central Railroad.¹⁸ During the Civil War, the Mississippi River was closed to commercial traffic. As a result, passengers and freight increased on established east-west railroads, such as the Erie and New York Central. The Erie Railroad became the first through line to the Midwest and Great Lakes in 1861, with financial control of lines to Buffalo and Chicago.¹⁹ Following in 1869, Cornelius Vanderbilt, merged the Hudson River Railroad and the New York Central Railroad into the New York Central and Hudson River Railroad.

Resources shown in bold indicate archaeological sites located only in the direct APE for new track proposed for the 125 Alternative

Overview of APE

Previously-identified architectural resources located within the direct and indirect APEs for the 90/110 Study Area and the 125 Study Area are summarized in Exhibit 4-20 in Chapter 4 of the Tier 1 Final EIS and Exhibit G-23 respectively. The NHLs, S/NR-listed- and -eligible historic districts are noted in the text below. Detailed tables listing the S/NR-listed and -eligible individual resources are provided in Exhibit G-24, respectively. The approximate locations of these resources are illustrated in Exhibit G-25, Historic and Cultural Maps (3 of 3), and the counties and municipalities within the APE are shown in Exhibit G-26.

Direct APE: 90/110 Study Area

A total of 79 previously-identified architectural resources are located in the direct APE for the 90/110 Study Area that extends along the Empire Corridor South/West and the Niagara Branch. These resources are summarized by county in Exhibit 4-20 in Chapter 4 of the Tier 1 Final EIS. Of the 79 architectural resources, three resources are NHLs: Fort Klock in St. Johnsville, Montgomery County, the Hudson River Historic District in Dutchess and Columbia Counties, and the New York State Barge Canal Historic District. Fort Klock was designated a National Historic Landmark District by the U.S. Secretary of the Interior in 1973. Fort Klock, a fortified stone homestead built in 1750, is part of a 30-acre complex that includes the historic homestead, a renovated Colonial Dutch Barn, blacksmith shop, and 19th century schoolhouse. The Hudson River National Historic Landmark District was designated by the U.S. Secretary of the Interior in 1990. The 32-square-mile district stretches from Germantown in Columbia County to Hyde Park in Dutchess County. It includes over 40 riverfront estates, two villages, four hamlets, and significant designed landscapes and farmlands. The 450-mile New York State Barge Canal National Historic Landmark District includes four branches of the canal system (Erie, Champlain, Oswego, and Cayuga-Seneca) and encompasses 552 contributing structures. It includes the Erie Canal in the study area and canalized river sections (Tonawanda Creek, Mohawk, and Hudson Rivers).

Seventy-six other S/NR-listed or eligible resources are within the direct APE. Of these, 61 are individual properties, while 15 are historic districts. The individual properties are identified in Exhibit G-24. The 15 historic districts include:

- **Westchester County (1 total)**
 - the Lord Burnham Factory Complex - contains two historic resources.
- **Putnam County (2 total)**
 - Cold Spring Historic District - comprised of 208 contributing buildings and 11 noncontributing buildings, the earliest of which dates from 1780. The majority of the buildings in the district date from the mid-19th century.
 - Garrison Landing Historic District - the 53-acre district contains 15 buildings and one structure consisting mainly of a small commercial and residential area located between what is now the Metro-North Hudson Line and the Hudson River in Garrison, New York. Its buildings were mostly erected in the 1850s, around the time the Hudson River Railroad, later the New York Central, laid the tracks.
- **Dutchess County (2 total)**

- Stone Street Historic District - composed of a one-acre site containing four houses constructed in the mid-19th century in the vernacular Greek Revival and Second Empire styles.
- Wheeler Hill Historic District – composed of 49 contributing buildings, 15 contributing sites, and four contributing structures, and encompasses the estates of Obercreek, Elmhurst, Edge Hill, Henry Suydam, William Crosby, and Carnwarth Farms that were developed between 1740 and 1940.
- **Columbia County (2 total)**
 - Clermont Estates Historic District - composed of 44 contributing buildings, was subsumed into the Hudson River National Historic Landmark District in 1990.
 - Hudson Historic District - consists of 756 contributing properties in a 139-acre area stretching from the Hudson River to the town of Hudson's eastern boundary.
- **Rensselaer County (1 total)**
 - Schodack Landing Historic District - consists of 86 contributing buildings located in the hamlet of Schodack Landing and includes a variety of buildings dated from the 18th through early 20th centuries.
- **Albany County (1 total)**
 - Broadway-Livingston Avenue Historic District - consists of 20 contributing buildings, including a collection of two-and three-story rowhouses built 1829-1876 and a railroad bridge built in 1900.
- **Schenectady County (1 total)**
 - Stockade Historic District - district is located in the northwest corner of Schenectady on the banks of the Mohawk River, and contains a variety of Dutch and English 17th and 18th century buildings.
- **Montgomery County (1 total)**
 - Nelliston Historic District – consists of 56 contributing buildings on three residential streets developed between 1860 and 1890 and a 1902 railroad station.
- **Herkimer County (1 total)**
 - Little Falls Historic District - contains 10 historic resources.
- **Monroe County (1 total)**
 - Brown's Race Historic District - located in Rochester along the Genesee River, the district contains 15 contributing buildings, 2 contributing structures, and 14 contributing sites in a primarily 19th century industrial complex.
- **Genesee County (1 total)**
 - Lake Street Historic District - located in Bergen, the district contains several of Romanesque Revival buildings from the last decades of the late 19th and early 20th centuries.
- **Erie County (1 total)**
 - Seneca Industrial Center - contains seven historic resources.

At least eleven S/NR-listed or eligible resources directly associated with the railroad are located in the direct APE. These include the Bear Mountain Bridge and Toll House and Scarborough Railroad Station in Westchester County; the Croton North Railroad Station and the Philipse Manor Railroad Station in Westchester County; the Poughkeepsie Railroad Station and Hyde Park Railroad Station and the Metro-North Railroad Bridge (BIN 5524010) in Dutchess County; the Stuyvesant Railroad Station in Columbia County; the Livingston Avenue Bridge in Rensselaer County; the Oriskany Railroad Station in Oneida County, and the New York Central Terminal in Buffalo, Erie County.

It should be noted that approximately 350 bridges meeting the 50-year age criterion for S/NR eligibility are located within the existing railroad alignment and thus within the direct APE. Any bridges 50 years old or older to be modified may also be evaluated for potential S/NR eligibility as part of the Tier 2 analysis. In order to evaluate the significance of these bridges, an architectural historian would conduct a field visit and would perform documentary research. The New York State Department of Transportation's Contextual Study of New York State's pre-1961 Bridges (November 1999), Evaluation of National Register Eligibility (January 2002), and Historic Bridge Management Plan (September 2002), would be consulted among other documentary sources.

Direct APE: 125 Study Area

A total of 60 previously-identified architectural resources are located in the direct APE for the 125 Study Area that extends along the Empire Corridor South/West and the Niagara Branch. These resources are summarized by county in Exhibit 4-20 in Chapter 4 of the Tier 1 Final EIS. Of the 60, two are NHLs: the Hudson River Historic District in Dutchess and Columbia counties and the New York State Barge Canal Historic District (described above).

Of the remaining 58 are S/NR-listed or eligible resources within the direct APE, 48 are individual properties and ten are historic districts. The 48 individual properties are identified in Exhibit G-24. Three individually-listed S/NR resources are located within the portion of the direct APE where new track is proposed for this alternative. These include: the Robert Liddle Farmhouse (MP 167) in Schenectady County; the Deferriere House (MP 253) in Madison County; and the Warren Hull House (MP 411) located in Erie County. The ten historic districts include: Lord Burnham Factory Complex; Cold Spring Historic District; Garrison Landing Historic District; Stone Street Historic District; Wheeler Hill Historic District; Clermont Estates Historic District; Hudson Historic District; Schodack Landing Historic District; Brown's Race Historic District; and the Seneca Industrial Center (described above). There are no S/NR-listed or eligible historic districts located in the portion of the direct APE where new track is proposed.

Indirect APE: 90/110 Study Area

A total of 356 previously-identified architectural resources are located in the indirect APE for the 90/110 Study Area that extends along the Empire Corridor South/West and the Niagara Branch. These resources are summarized in Exhibit G-23. Of the 356 architectural resources, five are NHLs. These include the two NHLs described above, the General Electric Research Laboratory in Schenectady County, and Sunnyside in Westchester County. The General Electric Research Laboratory is the first industrial lab research facility established in 1900. Sunnyside, formerly the home of noted early American author Washington Irving, is a historic house set on 10 acres alongside the Hudson River in Tarrytown.

Of the remaining S/NR-listed or eligible architectural resources within the indirect APE for the

90/110 Study Area, 305 are individual properties and 46 are historic districts. The individual resources are identified in Exhibit G-24. The 46 historic districts in the indirect APE include the 15 districts within the direct APE (described above) and the additional 31 described below:

- **New York County (7 total)**
 - Riverside Drive – West 80th-81st Streets Historic District - contains 32 rowhouses and town houses of the 1890s and three turn-of-the-century tenements, exhibiting a variety of architectural influences, and one later neo-Classical style apartment building of the 1920s.
 - Riverside Drive – West 105th Street Historic District - district is an L-shaped area extending along one block of West 105th Street, Riverside Drive and a part of the south side of West 106th Street, comprising 30 buildings on a block and a half.
 - Broadway-Riverside Drive Historic District (contains one resource).
 - Riverside Drive–West 135th-136th Streets Historic District (contains five resources).
 - Riverside–West End Historic District (contains 30 resources).
 - Upper Broadway Historic District (contains one resource).
 - West End Collegiate Historic District (contains 21 resources)
- **Westchester County (2 total)**
 - Scarborough Historic District - district contains 26 contributing buildings, two contributing sites, and one contributing structure. They are associated with three estates, a school complex, a cemetery, and two religious properties.
 - Anaconda Wire & Cable Company (contains three resources).
- **Dutchess County (3 total)**
 - Mill Street-North Clover Street Historic District - district is 27 acres in size, located between downtown Poughkeepsie and the Hudson River. Contains approximately 139 historic buildings dating primarily to the mid-19th century.
 - Union Street Historic District - district is an eight-block area located southwest of downtown Poughkeepsie dating to the late-18th century.
 - Main Street Historic District - the district, composed of six contributing structures including three houses and three commercial buildings, is located just west of the train station. The six buildings located on a single acre are an intact remnant of the hamlet as it developed in the mid-19th century, prior to the Hudson River Railroad's construction, which cut it in half.
- **Albany County (1 total)**
 - Clinton Avenue Historic District - the district is a 70-acre site in Albany composed of approximately 600 contributing buildings consisting primarily of 19th-century row houses in a variety of architectural styles.
- **Schenectady County (1 total)**
 - Union Street Historic District - the 65-acre district area includes 184 buildings built over the course of the 19th century.
- **Montgomery County (2 total)**
 - Amsterdam East Main Street Historic District (contains nine resources); and
 - Fonda Fairgrounds & Speedway Historic District (contains two resources).
- **Oneida County (1 total)**

- Lower Genesee Street Historic District - located in Utica, the district contains 45 contributing buildings dating from 1830 to 1929 north of the city center.
- Madison County (**1 total**)
 - South Peterboro Street Commercial Historic District - The district, located in Canastota, contains 20 contributing primarily two and three-story brick buildings built between 1870 and 1930.
- Onondaga County (**1 total**)
 - New York State Fairgrounds Historic District (contains one resource).
- Wayne County (**1 total**)
 - Village of Clyde Historic District (contains eight resources).
- Monroe County (**8 total**)
 - Bridge Square Historic District - district contains 24 contributing buildings that consist primarily of two-, three-, and four-story brick masonry commercial and industrial buildings dating from 1826 to 1928.
 - East Avenue Historic District - the district, located in Rochester, consists of approximately 700 buildings dating from the 19th and early 20th centuries.
 - Madison Square-West Main Street Historic District - located in Rochester, the district consists of 102 contributing structures and two contributing sites. 65 of the contributing structures are residential, with three contributing dependencies. Also in the district are 24 contributing commercial buildings and nine industrial buildings.
 - St. Paul-North Water Streets Historic District - district consists of a relatively intact cluster of 17 commercial, manufacturing, and warehouse structures in Rochester.
 - State Street Historic District - district consists of the last surviving continuous row of 19th century masonry commercial buildings within Rochester's Inner Loop. They were developed between 1825 and 1900 and the row forms an unpretentious unbroken wall of 12 buildings.
 - Birch Crescent Historic District (contains 12 resources).
 - Prince Alexander Historic District (contains 12 resources).
 - Public Market Historic District (contains ten resources).
- Genesee County (**1 total**)
 - Village of Bergen Historic District (contains five resources).
- Erie County (**2 total**)
 - Joseph Ellicott Downtown Historic District (contains one resource).
 - Wende Correctional Facility Historic District (contains one resource).

At least sixteen S/NR-listed or eligible resources directly associated with the railroad are located within the indirect APE. These include the eleven resources within the direct APE (described above) and the Andrews Street Bridge in Rochester, Monroe County; the Yonkers Railroad Station and the Tarrytown Railroad Station in Westchester County; the Mid-Hudson Bridge in Dutchess County; and the Rip Van Winkle Bridge in Columbia County.

TOTALS	5	3	305	199	46	32	356	235
Note: Counties are listed from south to north, then east to west. Resources that fall within the direct APE are also within the boundaries of the indirect APE. The 90/110 Study Area is used for analysis of Alternatives 90A, 90B, and 110 and consists of the existing 464-mile long Empire Corridor alignment. The 125 Study Area is used for analysis of Alternative 125 and consists of portions of the existing Empire Corridor and new alignment and is 450 miles long.								

Indirect APE: 125 Study Area

A total of 235 previously-identified architectural resources are located in the indirect APE for the 125 Study Area that extends along the Empire Corridor South/West and the Niagara Branch. These resources are summarized by county in Exhibit G-23. Of the 235 resources, three are NHLs, including the Hudson River Historic District in Dutchess and Columbia counties; Sunnyside, located in Westchester County, and the New York State Barge Canal Historic District (described above).

Of the 235 S/NR-listed or eligible resources within the indirect APE, 199 are individual properties

and 32 are historic districts. The individually listed or eligible resources are identified in Exhibit G-24. Five individually-listed or eligible S/NR resources are located within the portion of the indirect APE where new track is proposed for this alternative. These are: Nut Grove (MP 144) and 924 New Scotland Road (MP 147) in Albany County; the Reformed Presbyterian Church Parsonage (MP 169); and U.S. 20 between Knight and Mudge Roads (MP 170.5) and the Halladay House (MP 172) in Schenectady County. The 32 historic districts include the ten districts within the direct APE (described above) and the following additional 11 S/NR listed districts: Riverside Drive – West 80th-81st Streets Historic District; Riverside Drive – West 105th Street Historic District; Mill Street-North Clover Street Historic District; Union Street Historic District; Main Street Historic District; Bridge Square Historic District; East Avenue Historic District; Madison Square-West Main Street Historic District; St. Paul-North Water Streets Historic District; State Street Historic District (described above). There are no S/NR-listed or eligible historic districts located in the portion of the indirect APE where new track is proposed.

14.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.15). Exhibit G-27 compares the total number of resources (archaeological and architectural) affected by alternative.

The potential effects of the Base Alternative and the other Build Alternatives are described in more detail below.

14.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Tier 1 Draft EIS addressed the potential impacts on historic resources of the eight projects included in the Base Alternative.

The Base Alternative will maintain weekday service frequencies and included completion of the eight completed projects.

Categorical Exclusions for the eight Base projects identified no adverse direct, physical or contextual impacts to archaeological sites or architectural resources in the direct APE. The CEs were reviewed to determine the potential for cultural resource effects, and, in addition, the historic assessment performed for this Tier 1 Draft EIS included research on documented cultural resources within the Base projects' APE. Although no identified resources were located within the direct APE, 26 architectural resources have been identified for this analysis within the indirect APE for all the programmed projects.

14.2.2 Alternative 90A

Categorical Exclusions for three of the projects in the 90A Alternative have been prepared and have identified no adverse impacts to architectural resources or archaeological resources in the direct APE for those specific projects.

Exhibit G-27—Comparison of Potential Impacts to Archaeological Sites and Architectural Resources, by Alternative

RESOURCE TYPE	NUMBER OF RESOURCES														
	Base Alternative			90A			90B			110			125		
	Direct	Indirect	TOTAL	Direct	Indirect	TOTAL	Direct	Indirect	TOTAL	Direct	Indirect	TOTAL	Direct	Indirect	TOTAL
Archaeological Sites	N/A	N/A	3	30	N/A	30	88	N/A	110	86	N/A	108	35	N/A	57
NHLs	N/A	N/A	0	1	1	2	1	N/A	2	1	N/A	2	0	N/A	1
S/NR-listed/eligible Historic Districts	N/A	8	8	5	6	11	6	18	33	6	18	33	0	0	9
S/NR-listed / eligible Individual Resources	N/A	15	15	12	45	57	12	99	158	12	100	159	3	5	55
TOTAL	0	24	24	48	52	100	107	117	303*	105	118	302*	38	5	122*

Note: Resources that fall within the direct APE (D) are also located within the boundaries of the (I) indirect APE, as indicated in the Total column.

*The following resources identified in Alternative 90A for the Empire Corridor South are included in the total resource count for Alternatives 90B, 110, and 125: 22 archaeological sites; 1 NHL; 9 S/NR-listed Historic Districts; 47 S/NR-listed or eligible Individual resources

Direct APE: Archaeological Sites

There are 30 previously-identified archaeological sites located in the direct APE for Alternative 90A that could experience direct, physical impacts due to construction-related activities, including 12 burial/habitation sites. These include:

- **New York County** (Manhattan) – Native American habitation and midden site and rock shelter (**2 total**)
- **Bronx County** – Native American midden site (**1 total**)
- **Westchester County**: Native American midden and camp sites and three habitation/burial sites, and three other Native American sites (**8 total**)
- **Putnam County** – Native American burial site and other traces of occupation (**2 total**)
- **Dutchess County** – two Native American habitation sites; two camp/burial sites; two Native American stray find sites; one quarry site (MP 65); and two other sites (**9 total**)
- **Montgomery County** – Native American burial site, a trail site, and two other sites (**4 total**)
- **Onondaga County** – two Native American camp/habitation sites and two other sites (**4 total**)

Direct APE: Architectural Resources

There are a total of 18 previously-identified architectural resources located in the direct APE for Alternative 90A that could experience direct, adverse impacts due to construction-related activities. These are:

- **Westchester County** – Lyndhurst (Individual) (MP 24); and Garrison Landing Historic District (Historic District) (MP 50) (**2 total**)
- **Putnam County** – Cold Spring Historic District (S/NR-listed Historic District) (MP 52.5); *Individual*: U.S. Military Academy (MP 51); and West Point Foundry (MP 52) (**3 total**)
- **Dutchess County** –*Historic District*: Wheeler Historic District (MP 64); Stone Street Historic District (MP 65); *Individual*: National Biscuit Company Carton-Making and Printing Plant (MP 59); Mount Gulian (MP 61.5); Carman, Cornelius House (MP 62); Collyer, Capt. Moses W. House (MP 62); Poughkeepsie Railroad Bridge (MP 74); Poughkeepsie Railroad Station (MP 74); and Innis Dye Works (MP 74) (**9 total**)
- **Dutchess/ Columbia counties** – Hudson River Historic District (NHL) (MP 82-102) (**1 total**)
- **Rensselaer County** – Schodack Landing Historic District (Historic District); Livingston Avenue Bridge (Individual) (MP 143) (**2 total**)
- **Montgomery County** – Dove Creek Culvert (Individual) (MP 177.5) (**1 total**)

Work proposed for Alternative 90A is expected to occur within the existing right-of way. However, these resources are located within 100 feet of work proposed in the right-of-way. Therefore, construction-related activities could result in adverse impacts to these resources. A field survey would be conducted as part of the Tier 2 analysis as appropriate if adverse impacts are anticipated to identify potential architectural resources in the direct APE. Impacts would be assessed for any resources determined to be S/NR-eligible.

Indirect APE: Architectural Resources

There are 51 architectural resources located in the indirect APE for the 90A Alternative. These include:

- **New York County** (Manhattan) – Fort Tryon Park and the Cloisters (Individual) (MP 9) **(1 total)**
- **Bronx County** –*Individual*: Wave Hill (MP 13); Colgate Robert House (MP 13); and the William E. Dodge House (MP 12) **(3 total)**
- **Westchester County** –*Individual*: Croton North Railroad Station (MP 34); Standard House (MP 41); Peekskill Freight Depot (MP 41); Bear Mountain Bridge and Tollhouse (MP 45); Tarrytown Railroad Station (MP 25); Riverside Hose Company (MP 25); and a resource located on the southeast corner of Central Avenue and North Water Street (MP 41.5) **(7 total)**
- **Putnam County** –*Individual*: Wilson House (MP 49.5); Rock Lawn and Carriage House; and Eagle’s Nest (MP 51) **(3 total)**
- **Dutchess County** –*Historic District*: Main Street Historic District (MP 65); Union Street Historic District (MP 73.5); Mill Street-North Clover Street Historic District; *Individual*: Shay’s Warehouse and Stable (MP 65); Shay, William Double House (MP 65); Zion Memorial Chapel (MP 65); Brower, Abraham House (MP 65); Brower, Adolph House (MP 65); Bannerman’s Island Arsenal (MP 55.5); Chelsea Grammar School (MP 62); Church of the Holy Comforter (MP 73.5); Pelton Mill (MP 74); Old St. Peter’s Roman Catholic Church and Rectory (MP 74); Hoffman House (MP 74); Roosevelt Point Cottage and Boathouse (MP 76); Rhinecliff Hotel (MP 89); O’Brien General Store and Post Office (MP 89); Riverside Methodist Church and Parsonage (MP 89); Metro-North Railroad Bridge (MP 58); Mid-Hudson Bridge (MP 73); Johnson Plumbing Complex (MP 73); and Cornell Boathouse (MP 74.5) **(22 total)**
- **Columbia County** – Hudson Historic District (MP 114.5) (Historic District); *Individual*: Wiswall, Oliver House (MP 113.8); Requa House (MP 129); and Hudson and Boston Railroad Shop (MP 114.5) **(4 total)**
- **Montgomery County** –*Historic District*: Amsterdam East Main Street Historic District (MP 176); New York Barge Canal System Historic District (NHL) (MP 159-358.5); *Individual*: Guy Park Manor (MP 176.5); 6-8 Voorhees Street (MP 175.5); 366, 399, 401 West Main Street (MP 176.5); Guy Park (MP 177); resource on West Main Street (MP 177); and World War I Memorial (MP 177.5) **(10 total)**
- **Onondaga County** – New York State Fairgrounds Historic District (MP 294) (Historic District) **(1 total)**

Although adverse indirect, contextual effects to resources within the indirect APE are not anticipated, a field survey of potentially affected resources may be conducted as part of the Tier 2 analysis, if necessary to assess potential adverse effects to these resources and to identify potential architectural resources in the APE.

14.2.3 Alternative 110

Direct APE: Archaeological Sites

A majority of the previously-identified archaeological sites that have the potential to be adversely impacted by the Alternative 110 are the same as those that could be adversely impacted by the similar projects proposed for Alternative 90B, including 18 burial/habitation sites. There are three exceptions, which will result in Alternative 110 impacting two fewer sites than Alternative 90B:

- Two Native American unspecified sites located in the direct APE for Alternative 90B in Schenectady County are not located in the direct APE for Alternative 110.
- One Native American stray find site located in the direct APE for Alternative 90B in Montgomery County would not be located in the direct APE for Alternative 110. Conversely, one Native American habitation site in Montgomery County located in the direct APE for Alternative 110 is not located in the direct APE for Alternative 90B.

Direct APE: Architectural Resources

The number of historic resources located in the direct APE for Alternative 110 are the same as the number of resources located in the direct APE for Alternative 90B. Therefore, the number of previously identified architectural resources that could experience adverse, direct impacts due to construction-related activities in Alternative 110 is the same as those for Alternative 90B, the Preferred Alternative.

As with Alternative 90B, there are seven existing stations along Empire Corridor West where improvements are proposed for Alternative 110—one of which has been identified as a known architectural resource: Utica Station, located in Oneida County. Additionally, as with Alternative 90B, there are a number of rail bridges located within the right-of-way, which could be adversely impacted by work proposed for this alternative.

Certain elements of Alternative 110, including the proposed realignment of sections of Route 5, could potentially impact residential and commercial buildings outside the right-of-way at the following locations: MPs 164.5-165.4; 172.6; 173.6; 183.2; 184.5; 185; 186.8; 187.3; 189; 191.7; 192.5-192.8; 196.4; 196.7; 196.9; 198; 200.6; 210.8; 226.4-227; 228; 230.4-230.9; 360.6; 361.2; and 402.4.

The exact area of the proposed property acquisitions at MPs 168.3, 184.6, 186.3, 191.7, 198.1, 200.6, 207.5, 210.8, 215.1, 226.9, 228.0, 230.8, 237.2, 286.4, 341.1, 361.4, 377.6, and 389.1 has not yet been determined. This assessment assumes that the property to be acquired would be directly adjacent to the existing right-of-way. Although there are no previously identified architectural resources located in close proximity to these mile markers, there could be adverse impacts to potential architectural resources as a result of the property acquisitions proposed for Alternative 110.

Indirect APE: Architectural Resources

As with the direct APE, the number of historic resources located in the indirect APE for Alternative 110 are the same as the number of resources located in the indirect APE for Alternative 90B, with the addition of the Walrath-Van Horne House (MP 201.5), an S/NR-listed individual resource in Montgomery County. Although direct, adverse impacts to architectural resources are not anticipated

for resources located within the indirect APE, it is possible that this alternative could have indirect, contextual effects to these resources.

14.2.4 Alternative 125

Alternative 125 would also include the projects proposed for Alternative 90A in the direct and indirect APEs for Empire Corridor South (MP 1 to MP 143) and the Niagara Branch.

Direct APE: Archaeological Resources

There are 35 previously identified archaeological sites located in the direct APE of proposed new track for Alternative 125 (see Exhibit G-27) that could experience direct, physical impacts due to construction-related activities, including six burial/habitation sites. These are:

- **Albany County** – two Native American camp sites; and one historic industrial site (**3 total**)
- **Schenectady County** – Native American camp site (**1 total**)
- **Schoharie County** – Native American unspecified site (**1 total**)
- **Montgomery County** – Native American stray find and historic unspecified site (**2 total**)
- **Herkimer County** – Historic burial site (**1 total**)
- **Oneida County** – Native American camp site, burial, and habitation sites; and Site 3 identified by the Oneida Nation (**4 total**)
- **Madison County** – two Native American stray find sites and one camp site and Sites 4 and 5 identified by the Oneida Nation (**5 total**)
- **Onondaga County** – one Native American camp site, two Native American habitation sites; two Native American stray find sites; and two historic domestic sites (**7 total**)
- **Cayuga County** – Native American burial and stray find sites (**2 total**)
- **Wayne County** – Native American camp and stray find sites (**2 total**)
- **Genesee County** – two Native American camp sites and one Native American stray find site (**3 total**)
- **Erie County** – two Native American camp sites; one Native American camp/stray find site; and one Native American stray find site (**4 total**)

Direct APE: Architectural Resources

Work proposed for the Alternative 125—which mainly consists of the construction of new track—could have adverse impacts on architectural resources located within the direct APE due to construction-related activities.

There are three architectural resources located in the direct APE for Alternative 125 that could experience direct, adverse impacts due to construction-related activities. These include:

- **Schenectady County** – Liddle, Robert Farmhouse (Individual) (MP 167) (**1 total**)
- **Madison County** – Deferriere House (Individual) (MP 252.8) (**1 total**)

- **Erie County** – Hull, Warren House (Individual) (MP 411) **(1 total)**

Indirect APE: Architectural Resources

There are five architectural resources located in the indirect APE for the Alternative 125. These include:

- **Albany County** – *Individual*: Nut Grove (MP 144); and 924 New Scotland Road (MP 147) **(2 total)**
- **Schenectady County** – *Individual*: Reformed Presbyterian Church Parsonage (MP 169); Halladay House (MP 172); and US 20 between Knight and Mudge Roads (MP 170.5) **(3 total)**

Although direct, adverse impacts to architectural resources due to construction-related activities are not anticipated for resources located within the indirect APE, it is possible that this alternative could have indirect, contextual impacts to these resources.

15. Parks and Recreational Areas

15.1 Existing Conditions

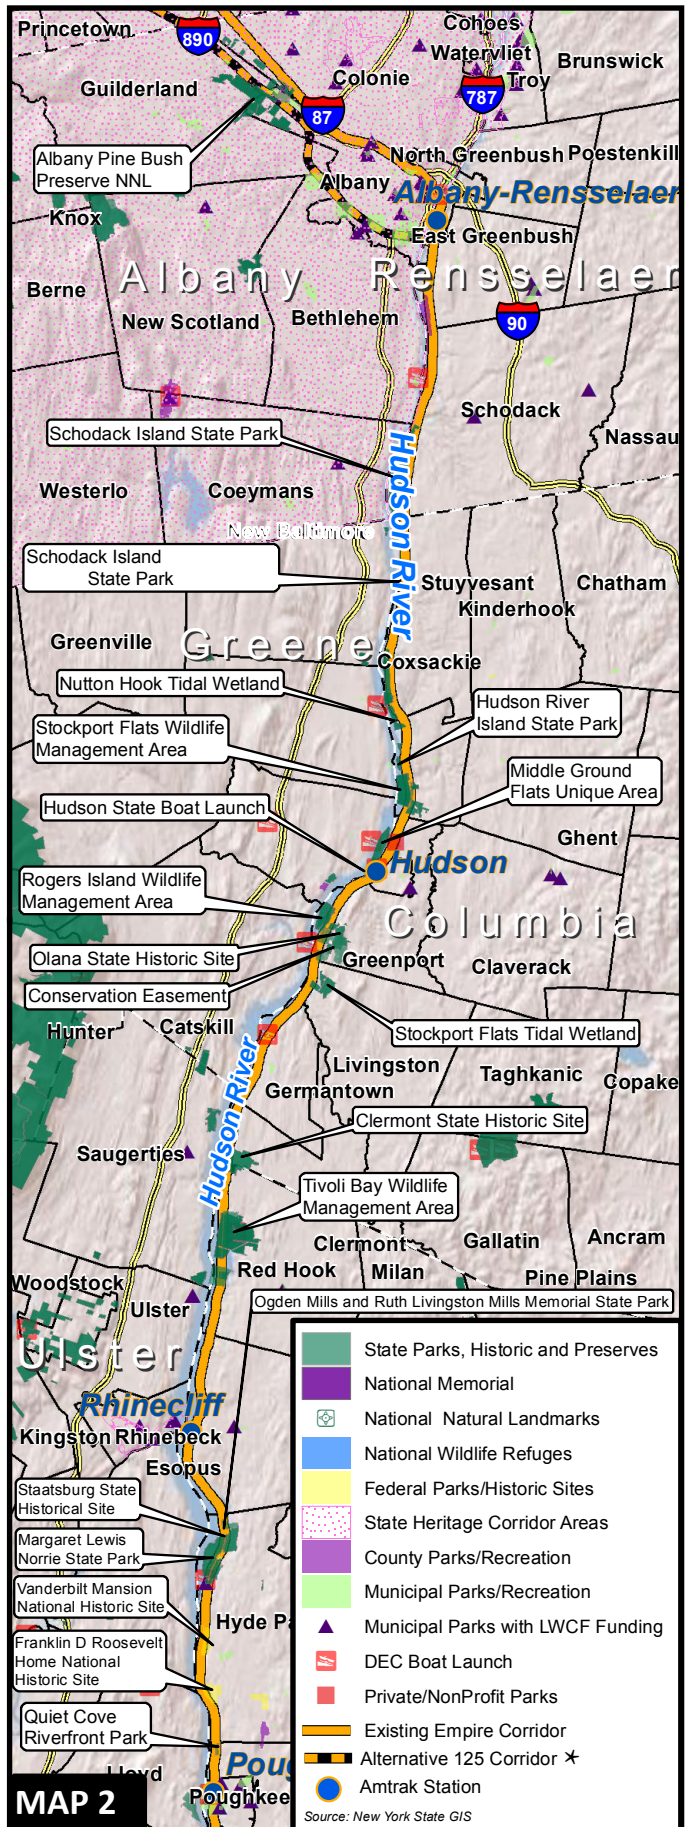

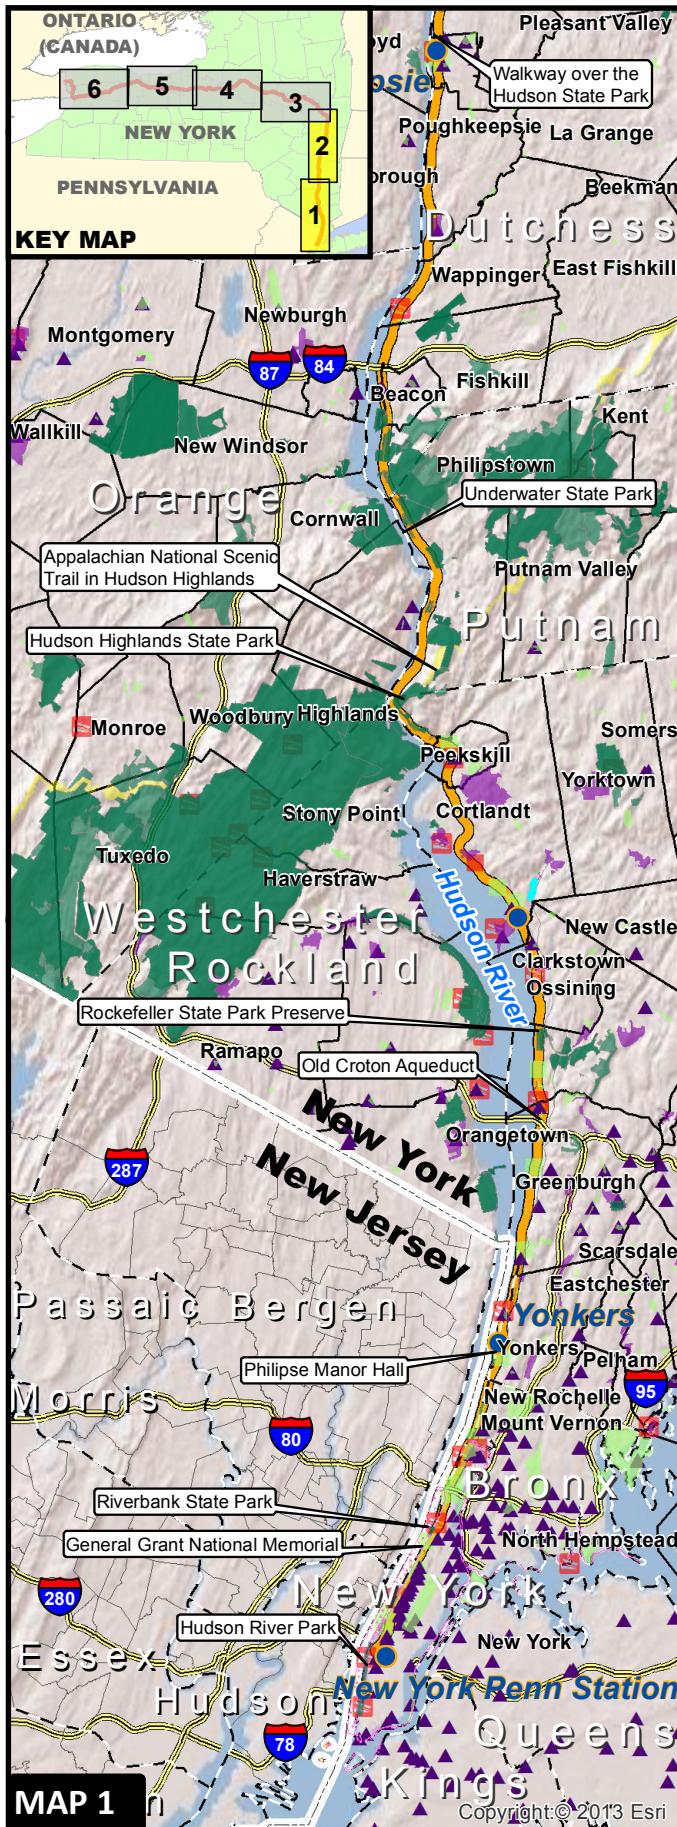

The federal, state, regional, and local parks in the study area are shown in the following exhibits. There are several types of federally designated parks or recreation areas in the study area, including National Heritage Areas, a National Memorial, several National Natural Landmarks, a National Wildlife Refuge, National Historic Sites, and National Scenic/Recreational Trails. Exhibits 4-36 through 4-40 provides a detailed listing of federal, state, county, and local parks and recreation areas within 1,000 feet of the corridor centerline. Exhibit 4-36 summarizes the publicly owned acreage of these federally-protected potential Section 4(f) or 6(f) parkland resources within 1,000 feet of the corridor centerline for the 90/110 and the 125 Study Areas.

New York State has designated state parks, areas of cultural and historic significance, state historic parks, and state historic sites that are administered by the NYSOPRHP, as shown in Exhibit 4-37.

New York state forests and state-owned Wildlife Management Areas are administered by the New York State Department of Environmental Conservation. The NYSDEC state forests preserves and unique areas, and Wildlife Management Areas within 1,000 feet of the corridor centerline for both the 90/110 and the 125 Study Areas are shown in Exhibit 4-38, one of which has received Section 6(f) funding.

There are roughly 100 county, municipal and non-profit parks identified within the study area. Exhibit 4-39 and Exhibit 4-40 show these parks within the 90/110 and 125 Study Areas and potential protections under Section 6(f) and Section 4(f).

Exhibit G-28 shows the locations of the parks and recreation areas in the study area.

*Alt. 125 as shown is a potential corridor used to analyze the potential operating characteristics, environmental impacts and cost for this speed (125 mph) threshold.

Tier 1 EIS
High Speed Rail
Empire Corridor Program

15.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.16). The potential effects of the Base Alternative and the other Build Alternatives are described in more detail below.

15.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Tier 1 Draft EIS addressed the potential impacts on parks and recreation areas of the eight projects included in the Base Alternative. The Base Alternative will maintain weekday service frequencies. Because proposed work with this alternative was anticipated to be located entirely within the right-of-way, no land acquisitions were anticipated, and no impacts to parklands were anticipated.

15.2.2 Alternative 90A

It is anticipated that work could be contained within the right-of-way, and no direct impacts on parklands are anticipated. Increased frequency of service could have the potential to incur additional visual and noise impacts from train passbys, however the additional trips represent a minimal increase.

15.2.3 Alternative 110

Empire Corridor South

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, is proposed, and additional direct parkland impacts are not anticipated to occur. Increased frequency of service could have the potential to incur additional visual and noise impacts from train passbys, however the additional trips represent a minimal increase over current rail traffic that includes frequent MetroNorth commuter rail.

Empire Corridor West/Niagara Branch

With Alternative 110, trackwork would start at MP 159 and extend west from here, crossing over the Mohawk River/Erie Canal on an existing bridge. In the City of Schenectady, Front Street Park and Pool adjoins the south side of the railroad on the south river bank, and the Glenville Bike Trail extends under the bridge on the north river bank. Further set back on the southwest side are Riverside Park in Schenectady and Collins Park and Lake in Scotia. At MP 167, the railroad extends north of the Lock 9 Canal Park, which is on the opposite (southwest side) of Route 5, but will not directly impact the park.

Work that may extend outside of the right-of-way may occur at Amsterdam Station and at other locations in Montgomery County. Proposed track and station improvements at Amsterdam Station and trackwork at MP 179 are located in the vicinity of the Erie Canal, but should not affect the canal.

In Monroe County, the addition of a fourth track around the Rochester Station could also involve

right-of-way impacts. This work will extend in the vicinity of facilities such as Upper Falls Park in the City of Rochester and will cross the Erie Canal and the Erie Canalway Heritage Trail at MP 374.5, but are not anticipated to directly affect parklands. If Alternative 110 had been selected as the Preferred Alternative, the potential for impacts at the canal crossing will be evaluated as designs are advanced in Tier 2.

In Genesee County, Alternative 110 may impact a county park at MP 402. The proposed track alignment passes through the Dewitt County Recreational Facility in the Town of Batavia.

15.2.4 Alternative 125

Alternative 125 would include Alternative 90A improvements along the Hudson Line and Niagara Branch. Alternative 90A would largely be situated within the right-of-way and therefore would not involve substantial parkland impacts.

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. Since there are no parklands within this one-mile section of rail corridor, there are no additional direct impacts to parklands within Empire Corridor South. Increased frequency of service could have the potential to incur additional visual and noise impacts from train passbys, however the additional trips represent a minimal increase over current rail traffic that includes frequent MetroNorth commuter rail.

Empire Corridor West/Niagara Branch

At MP QH152, the New York State Thruway and Alternative 125 enter the Albany Pine Bush Preserve. At MP QH153, Alternative 125 transitions off of the Thruway median and may impact the Albany Pine Bush Preserve at this location. At MP QH155, Alternative 125 may impact Fusco Town Park located directly to the south of the Thruway and the rail corridor.

In Herkimer County, between MPs QH217 and QH218, Alternative 125 passes through a wooded area in Russell Park within the Town of German Flatts.

Between MPs QH244 and QH245, Alternative 125 also passes through Atunyote Golf Club, owned by the Oneida Nation, within the Town of Vernon.

Alternative 125 crosses Erie Canal State Park at three locations before meeting up with the existing rail corridor at MP 283 (just before MP QH269 in the 125 Study Area). The three Erie Canal State Park crossings are located between MPs QH260 and QH261; between MPs QH262 and QH263, both in Madison County; and between MPs QH265 and QH266 in Onondaga County.

In Onondaga County, west of the Syracuse station at MP QH278.5, Alternative 125 passes by Onondaga Lake County Park. The tracks would be on elevated structure above the existing tracks at this location, so right-of-way should be minimized.

In Monroe County, close to the Genesee border, Alternative 125 passes near Churchville County Park

at MP QH371. No additional impacts to parklands are anticipated for the remainder of the 125 Study Area from MP QH371 to where it merges back to the existing corridor at MP QH413 in Erie County.

In Erie County, just past MP QH408, Alternative 125 passes near Clarence Town Park, which may be impacted by this alternative. Between MPs QH408 and QH409, this alternative passes through the Tillman Road Swamp State Wildlife Management Area that may be impacted.

16. Visual

16.1 Existing Conditions

16.1.1 Empire Corridor South

Views from the Railroad

In **Manhattan** (MPs 0 to 11.5), the railroad runs primarily in a tunnel from Pennsylvania Station to 123rd Street. However, there are some sections that are daylighted: 36th Street to 39th Street, 43rd Street to 46th Street, 48th Street to 49th Street and 60th Street to 61st Street. Where the railroad runs aboveground, the viewshed in Manhattan is entirely urban and the landform is flat.

After the railroad daylights north of 123rd Street, the railroad is bracketed by the Henry Hudson Parkway (Route 9A) on the west and Riverside Drive on the east. The railroad passes underneath elevated Riverside Drive from 153rd Street to 155th Street, and underneath the Henry Hudson Parkway just past MP 7. North of where the railroad crosses under the parkway, the railroad extends through the greenway along the Hudson River and continues under the George Washington Bridge (I-95) at MP 8, closely following the river's edge north of I-95. The tracks again pass underneath the elevated Henry Hudson Parkway interchange ramps between MP 9 and MP 10.

The views at the crossing of the Spuyten-Duyvil swing span bridge into Bronx County are primarily of the Harlem River and Hudson River to the west. In **Bronx County** (MPs 11.5 to 14), the railroad closely follows the edge of the Hudson River. Views to the west are of the Hudson River, and a forested buffer, including Riverdale Park on the south (MPs 11.5 and 13), dominates the views to the east. The northernmost section in the county includes the Metro-North Riverdale Station (MP 13) and the campus of the College of Mount Saint Vincent to the east of the railroad is buffered by forested vegetation.

In **Westchester County** (MPs 14 to 45), the railroad continues to closely follow the east river bank, but transitions from a primarily urban landscape on the south at the Yonkers Station MP 15, to more rural forested landscapes with coves and high bluffs to the north. The viewshed consists of the Hudson River to the west, and includes urban development along the more urban waterfronts, and views to the east are generally buffered by vegetation along the tracks. The viewshed in the northern part of the county is a mix of urban and forest land along the corridor. The landscape becomes more rural north of Yonkers, and the railroad extends under the Tappan Zee Bridge (MP 25) and north through more urban areas of Tarrytown, Ossining, Croton-on-Hudson, and Peekskill.

With but a few exceptions, the railroad closely follows the east bank of the Hudson River through most of Westchester County, particularly to the south. South of Peekskill there are several long, fairly sharp curves that bring the railroad well inland. The rail corridor is within the Hudson Highlands Scenic Area of Statewide Significance (SASS) between MP 40.5 to the Westchester County line. This

segment is especially scenic, passing through the Hudson Highlands, requiring several short tunnels where the Hudson River narrows and the landscape on both sides rises precipitously from zero to 1,000 feet in several locations. At the northern end of the county, the railroad passes under the Bear Mountain Bridge (MP 45) and through four tunnels along this section of the railroad, which temporarily obstruct views to and from the train:

- Osca Tunnel (MP 36.80), approximately 250 feet long
- Little Tunnel (MP 43.62), approximately 75 feet long
- Middle Tunnel (MP 44.40), approximately 300 feet long
- Route 6 Tunnel (MP 45.07), approximately 175 feet long

There are also a number of bays that intrude inland where the railroad is built on causeways that include a small bridge to drain Peekskill Bay and associated streams and small rivers. In areas where the railroad heads inland the views from the railroad are generally of forest or marsh areas from both sides of the train.

Upon crossing into **Putnam County** (MPs 45 to 54.5) the railroad continues to closely follow the east bank of the river, and the primary viewshed is dominated by the river and high forested bluffs and several coves and marshlands along this section. Near MP 50 to 52, there are scenic views of the West Point Military Academy high on the banks of the west river bank. The entire county is located within the Hudson Highlands SASS, and at the northern end of the county, the railroad passes through Hudson Highlands State Park. The railroad passes through two tunnels, Garrison Tunnel (MP 50.06), approximately 450 feet long, and Breakneck Tunnel (MP 54.52), approximately 550 feet long, before continuing into Dutchess County.

In **Dutchess County** (MPs 54.5 to 100.5), the railroad continues to closely border the east river bank. The railroad passes north through the Hudson Highlands State Park, before entering urban areas in Beacon and passing under the Newburgh-Beacon Bridge (I-84) (MP 60). The railroad extends through Scenic Areas of Scenic Significance (SASSs) throughout the length of the county, with the exception of the section of railroad between the state park (the Hudson Highlands District SASS at MPs 54.5 to 58) and just south of Poughkeepsie. The railroad extends along the river bank, continuing on causeway across several coves, before passing through Poughkeepsie, and extending under the Mid-Hudson Bridge (U.S. Route 44 and State Route 55) and the Walkway over the Hudson State Park Bridge, just south of the Poughkeepsie Station. North of Poughkeepsie, the railroad extends through the Estates District SASS (MPs 70 to 100.5), adjoins Esopus/Lloyd SASS (MPs 70 to 87), and extends in the vicinity of a number of historic estates and parks between Hyde Park and Staatsburg. The railroad does move inland away from the Hudson River at Staatsburg.

To maintain a relatively straight alignment, the railroad constructed a large number of causeways where bays and marsh areas intrude inward from a straight path. One of two causeways in Dutchess County that are notable for their length includes the 0.8 mile-long Vanderburgh Cove. To the north, the railroad closely follows the river's edge, passing through the Rhinecliff-Kingston Station before passing through the approximately 230-foot-long Rhinecliff Tunnel (MP 91.33) and under the Kingston-Rhinecliff Bridge (MP 93). To the north, the railroad passes over the other notable causeway, the 1.5-mile-long Tivoli Bay at Annadale, and passes through the Tivoli Bays State Wildlife Management Area between MPs 95.5 and 98.5. The Tivoli Bays is also included in the Mid-Hudson Historic Shorelands Scenic District designated under Article 49 of the Environmental Conservation Law.

In **Columbia County** (MPs 100.5 to 129.5), the railroad continues to closely follow the eastern river

bank, particularly on the southern half of the county. Views from the railroad are dominated by forested vegetation, open space, and the Hudson River and its islands and marshes on the southern half of the county. The railroad extends through either designated scenic areas or parks through the majority of the county. The corridor runs through Estates SASS District from the Dutchess County line (MP 100) to MP 103.5. The other SASS districts that the corridor runs through in Columbia County are the Catskill Olana District (MPs 107 to 112) and the Columbia/Greene North District (MPs 115 to 129.5), which extends into Rensselaer County. The railroad extends past several islands where it extends along the shoreline. The railroad adjoins Roger's Island where it passes under the Rip Van Winkle Bridge at MP 111.5. To the north, the railroad passes another island (Middle Ground Flats), north of the Hudson Station, where the railroad extends across a long, 1.6-mile-long causeway over North Bay. To the north, the railroad extends past the Hudson River Islands where it extends on causeway over several coves. To the north, the railroad moves further inland in sections and away from the Hudson River shoreline, roughly parallel to New York State Bicycle Route 9/Route 9J. The railroad extends along the edge of Muitzes Kill, a branch of the river that adjoins Houghtaling Island at the north end of the county, where it extends into Rensselaer County.

The viewshed in the **Rensselaer County** (MPs 129.5 to 143) section varies from forested and agricultural to urban, with the urban areas clustered in and around the city of Rensselaer at the north end of the county. The Columbia-Greene SASS extends on the southernmost part of the county, from the county line (MP 129.5) to MP 131.5. The southern third of Rensselaer County continues alongside the island in the Hudson River (Schodack Island/Castleton Island State Park), bracketed by Muitzes Kill on the west and New York State Bicycle Route 9/Route 9J on the east. The railroad extends under the Castleton Bridge (Berkshire Connector of the New York State Thruway) and continues along the bank of the Hudson River past the north end of Schodack Island, passing through the village of Castleton-on-Hudson. North of the village, the railroad extends inland, passing between Moordener Kill on the west and Route 9J on the east, and continuing north through forested and agricultural lands and alongside the east side of the Papscaene Island Nature Preserve (MPs 137.5 to 139). Where the railroad rejoins Route 9J, just outside the city of Rensselaer, the adjoining uses along the river and extending into the city include industrialized uses and fuel tank farms. Approaching the Albany-Rensselaer Station, there are views of the Albany skyline across the river, and adjoining urbanized areas also include residential neighborhoods and office buildings. After leaving the Albany-Rensselaer Amtrak station (MP 142) the railroad continues north through urban/industrial areas. The railroad crosses the Hudson River at the Livingston Avenue Bridge, a swing-span bridge, (west of MP 143) where the river is fronted by parks and greenways.

16.1.2 Empire Corridor West/Niagara Branch (90/110 Study Area/125 Study Area)

Views from the Railroad: 90/110 Study Area

After crossing the Livingston Avenue Bridge into **Albany County** (MPs 143 to 155), the viewshed includes parks/greenways along the river and industrialized waterfront development in the city of Albany. The eastern half of the county includes views of industrial urban development, and views from the railroad are screened by forest vegetation and include views of adjoining or overpassing highways and interchange ramps where the railroad roughly parallels I-90 (New York State Thruway) and crosses under the Adirondack Northway (I-87), just past the city limits. The views along the western half of the county are dominated by screening by forest vegetation within a patchwork of parklands (including the Albany Pine Bush State Unique Area) and undeveloped lands.

In **Schenectady County** (MPs 155 to 170), even though the tracks pass through urbanized areas that include residential neighborhoods on the southern half of the county, the tracks are adjoined by trees in many locations that screen views of adjacent areas. In the city of Schenectady, the views from the train include views of institutional uses and the downtown business district. The railroad extends along a 0.2-mile section of Erie Boulevard, the western end of the Mohawk Towpath Scenic Byway, a New York State scenic byway. The views north of the downtown area include the Mohawk River/Erie Canal at the river crossing, and the railroad extends through increasingly more rural forested areas with pockets of farmlands to the north where views are buffered in many locations by trees. North of the river crossing, the middle third of the county extends through more developed and residential areas in and north of the village of Scotia, although trees shield views of adjoining properties in many locations. The northern third of the county, views includes intermittent views of Route 5 and the Mohawk River/Erie Canal where the railroad parallels these features.

The Revolutionary Trail Scenic Byway (Route 5/29) extends alongside the length of the Empire Corridor and the Mohawk River/Erie Canal from Route 5 in Schenectady County to Herkimer, then follows Route 5S and the Erie Canal to Utica and continues northwest along Route 49 and the Erie Canal to Rome in Oneida County. The eastern half of the Empire Corridor West is quite scenic as the railroad closely follows the Mohawk River/Erie Canal to Herkimer where West Canada Creek flows into the Mohawk River to drain part of the Adirondack Highlands. The east-west passage of the Mohawk River follows a natural divide between the southern Adirondack uplands to the north and the northern fringes of the Catskills to the south. Both of these uplands bordering the Mohawk River can be described as a peneplain; an eroded plateau with a rolling surface. The Mohawk River is considerably less than straight and in places plateaus rise steeply over 800 feet. West of Herkimer, the railroad follows the New York State Canal System and follows the natural lower path to the west exploited by the builders of the Erie Canal. The landscape becomes less vertical approaching Utica.

In **Montgomery County** (MPs 170 to 210), the railroad closely parallels and extends between Route 5, on the north, and the Mohawk River/Erie Canal on the south, throughout much of the county. Views throughout the county are dominated by Route 5 and adjoining uses, which are predominantly rural agricultural, forested, and residential, with views of the river where it closely adjoins and is not screened by forest vegetation. In the eastern sections of the county, rock ledges adjoin Route 5, and the slopes adjoining the railroad steepen, and generally flatten throughout the rest of the county. Where the railroad closely adjoins the riverbanks, views include uses on the opposing river bank where the river narrows, and there are several islands in the river. In some locations, the railroad is set back from Route 5, and views of the highway are obscured by trees. Urban viewsheds are largely limited to the city of Amsterdam, with the Amsterdam Amtrak Station (MP 177.5); the village of Fonda; and the village of St. Johnsville. In the villages of Palatine Bridge and Nelliston, where the railroad follows the riverbank, it is set back from the village centers and screened by forest vegetation.

The railroad continues to parallel Route 5 and the Mohawk River/Erie Canal throughout much of **Herkimer County** (MPs 210 to 235). The viewshed along the railroad consists of forest, agricultural, and rural residential uses outside the cities of Little Falls and Herkimer. In many locations, where the railroad does not closely adjoin Route 5 or the river, views of these features are obscured by trees. A majority of the landform along the rail corridor is flat with the exception of moderate to severe slopes near Little Falls and Herkimer. The railroad passes through the southern outskirts of both cities, and views from the tracks are screened from view to varying extents by trees and limited by steeper slopes. Scenic islands in the river/canal include the Moss Island National Natural Landmark in Little Falls (near MP 216), where intermittent views of the rock ledges may be visible through trees adjoining the tracks, and Plantation Island State Wildlife Management Area south of the city of

Herkimer (MP 222). The New York State Thruway (I-90) crosses over the railroad in the southwest part of the city of Herkimer (MP 225). At MP 231.5, the railroad crosses the Erie Canal just south of Lock 19, which is visible at the canal crossing.

In **Oneida County** (MPs 235 to 264), west of the county line, the railroad is shielded by trees and surrounded by forested areas where it extends past industrialized areas. The railroad closely adjoins a section of Route 5S to the west, passing into industrialized areas surrounding the Utica Boehlert Transportation Center (MP 237.5) at the northern edge of city. The railroad extends through flat open and industrial areas adjoining the station area, then extends west under the I-790 interchange ramps. West of these ramps, the views from the railroad are screened by forested areas, which occupy the majority of area north of the tracks where there are large expanses of marshland, forestland, and farmland and scattered industrial uses. At MP 241.8, the tracks cross under the New York State Thruway (I-90). The south side of the tracks are bordered by residential neighborhoods, many of which are screened by trees, and industrial/commercial uses. Further west, the railroad extends through the Oriskany Flats State Wildlife Management Area at MPs 244.8 to 246.6 and other undeveloped lands and continues through the southern, less developed half of the city of Rome, including the Rome Station (MP 251.3). The railroad is set back from the Erie Canal in Rome, and views of the canal are screened by trees. Further west, the railroad continues through farmlands, wetlands, forestlands, and the Rome State Wildlife Management Area (MPs 253.6 to 255.8).

In **Madison County** (MPs 264 to 278), the viewshed is predominantly forest land and agricultural land with urban development concentrated in the middle of the county in the village of Canastota. The corridor is almost entirely flat. West of the Oneida county line, the railroad extends through the northern, less developed areas of the city of Oneida, where views of adjoining areas are screened to a large extent by trees that either adjoin the right-of-way or are part of extensive areas of forest along the railroad. The Old Erie Canal State Park/Erie Canalway Trail extends north of or alongside the railroad between MPs 266.5 to 269, and the Old Erie Canal and adjoining areas of swamp adjoins the tracks in several locations, continuing north of, and further from, the railroad through Canastota. In Canastota, the views from the tracks are of more densely developed residential neighborhoods, businesses, and industrial uses. West of Canastota, the Old Erie Canal rejoins the north side of the railroad, north of Barlow Street, at MP 270.5, eventually crossing the railroad at MP 272. Agricultural lands are a more prominent feature of the surrounding landscape in the western part of the county, where the railroad continues through rural, partially forested landscape.

Crossing into **Onondaga County** (MPs 278 to 309), the viewshed continues to be primarily agricultural and forested, paralleling Saintsville Road and adjoining residences and businesses to the north, before crossing on the south side of Dewitt Yard (MPs 282.5 to 286) in and west of the village of Minoa. Views south of the tracks are of forested and residential areas through forested buffers alongside the railroad, transitioning to industrial uses approaching the I-481 Bridge in East Syracuse. West of this area, the railroad extends through increasingly urbanized and industrial/commercial areas in and around the city of Syracuse, with some views from the railroad screened by forest vegetation. In downtown Syracuse, the railroad is buffered by trees where it extends between Ley Creek on the west and the Alliance Bank Stadium and the Syracuse Regional Transportation Center (MP 291.5) on the east. Past the station, the railroad extends under the I-81 bridge and interchange ramps, and between Onondaga Lake and park on the west, and the Carousel Place shopping mall on the east. The railroad extends over the Erie Canal outlet along the lakefront and is buffered by trees to the south where it extends past industrial uses on the east, under I-690, and continues through industrial urban development (including the State Fairgrounds) west of the city of Syracuse. West of the fairgrounds, the railroad is buffered by trees where it extends through increasingly rural forested and agricultural areas and scattered industrial and residential areas. Although sections of the

railroad closely parallel the New York State Thruway (I-90) and the Erie Canalway Trail, views are largely obscured by forested vegetation.

Leaving Onondaga County, the railroad extends west following a broad, level valley generally drained by the west to east flowing Seneca River/Erie Canal. In **Cayuga County** (MPs 309 to 320), the primary viewshed consists of agricultural and forest lands with rural, low-density development, and no viewsheds in major urban centers. The landform is generally flat with some small areas of mild to moderate slopes along either side of the rail corridor, which limits views. The Canalway Trail – Erie Section is located along the corridor between MPs 311 and 312. The railroad extends under the New York State Thruway (I-90) at MP 315. Approaching the Wayne County line, the railroad crosses the Seneca River/Erie Canal at MP 319.30 and then the extensive marshes within the wide floodplain of the now narrow Seneca River, adjoining the south side of Howland Island within the Northern Montezuma State Wildlife Management Area. The crossing of the Seneca River, on the other (west) side of Howland Island, forms the Wayne County line at MP 320.2.

The predominant viewshed in **Wayne County** (MPs 320 to 357) is mostly agricultural with large areas of forestland and wetlands. On the eastern end of the county, the railroad adjoins the Northern Montezuma State Wildlife Management Area (MPs 320 to 321.5). Views from the railroad include Route 31, which roughly parallels sections of the railroad, after crossing it in the village of Savannah (MP 322.5), through the eastern half of the county. The railroad also extends across the Montezuma National Wildlife Refuge (MPs 323.3 to 325.6), where views of adjoining Route 31 and, to some extent, surrounding swamp and marsh areas, are obscured by heavy forest and shrub vegetation. The landform along the railroad in the county is generally flat with some areas of moderate to steep slopes. Approaching Clyde at MP 328 and continuing west through the county (around these major drainages), the railroad encounters a region of prominent north-south oriented drumlins. These rounded, elongated ridges were formed during periods of glaciation that eroded the Allegheny Plateau – Finger Lakes Region to the south. Viewsheds include the Erie Canal, which extends in close proximity to the railroad in portions of the county, where it closely adjoins the railroad through Clyde, crosses the railroad in Lyons and again near Newark. Urban views in the villages of Savannah, Clyde, Lyons, and Newark are limited by screening by trees and the location of the railroad in the outskirts of these villages. However, views of urbanized areas along the track include the business and agricultural industrial district in and around Clyde, the rail yard and businesses and neighborhoods in Lyons, and industrial areas in Newark. Although the canal runs parallel to the railroad and alongside the Canalway Trail-Erie Canal Heritage Trail (between MPs 354.5 and 357) approaching the Monroe County line, the canal is offset by a forested buffer, which largely obscures views from the railroad.

Entering **Monroe County** (MPs 357 to 388), the railroad closely parallels the bank of the Erie Canal, to the south, extending through largely forested, undeveloped areas. Forested buffers, including several park areas, adjoin the railroad through the eastern part of the county. The railroad extends further from the canal as it continues west through increasingly urbanized areas, extending close to the canal before the two diverge. The railroad passes under the I-590 Bridge and I-490 interchange ramps near the city limits. West of the interchange, entering the city of Rochester, the viewshed becomes increasingly urban and dominated by hardscape, with parking lots, businesses, and industries closely adjoining the railroad and limited or no screening by trees. The railroad adjoins the south side of the Rochester railyard (MP 369) and continues alongside commercial and industrial areas, and south of the Rochester public market. To the west, approaching the Rochester Station (MP 371), the railroad continues above the grade of underpassing roadways and includes a tree buffer that partially screens views of the adjoining commercial/industrial areas. To the west, the railroad extends over the Genesee River (MP 371.3) just upstream (south) of the High Falls, or Upper Falls,

and downstream (north) of the Inner Loop bridge. The railroad continues through the downtown business district adjacent to the Inner Loop, passing by Frontier Field just east before passing over the I-490/Inner Loop Interchange bridges (MP 371.85), with views to the north screened to some extent by trees. The viewshed through the remainder of the city is screened to some extent by trees, but views consist of commercial and residential buildings, before crossing at the Erie Canal and the Canalway Trail-Erie Canal Heritage Trail (MP 374.5). To the west, the viewshed includes increasing areas of forested/undeveloped areas with lower density development outside of the city, continuing through industrialized areas and crossing under I-390 at MP 374.75 and under I-490 at MP 377. The viewshed in the remainder of the county is rural and forested, with low density residential uses and farmlands closer to the county line.

In **Genesee County** (MPs 388 to 418) the viewshed is primarily agricultural with smaller areas of forest and views of residential and scattered commercial/industrial uses. The eastern half has views largely of agricultural fields, although forested buffers screen views in many locations. Urban views in the county are limited as the railroad extends through the outskirts of the city of Batavia in the middle of the county, passing through several parks and recreational areas in and just outside the city limits. The railroad crosses over the New York State Thruway (I-90) at MP 399.3. The western half of the county provides viewsheds of forest and farmlands, with scattered residential and commercial buildings, and parallels Route 33 to the north, which is offset and largely screened by vegetation or buildings.

Entering **Erie County** (MPs 418 to 439/QDN1 to QDN13), the viewshed from the railroad consists primarily of agricultural and forested lands. The viewshed becomes increasingly urban in the village areas approaching the Buffalo-Depew Station (MP 431.6) and the town of Cheektowaga, where views from the railroad include adjoining Ellicott Road/Route 130, to the south, and an overhead crossing of I-90 (Governor Thomas Dewey Thruway). Approaching and passing into the city of Buffalo, the views from the railroad include industrialized areas (including the Frontier railyard and the Buffalo Terminal) and higher density neighborhoods. In the downtown area, views include commercial buildings, to the north, and the elevated Niagara Thruway (I-190) structure, on the south. At the Buffalo Exchange Street Station, interchange ramps and elevated I-190 extend overhead, and the Buffalo skyline, including Coca Cola Field and parking facilities, are visible to the north. The railroad passes under the I-190/Route 5 Interchange through a 500-foot tunnel and a 565-foot tunnel. Route 5 in this location is part of the Great Lakes Seaway Trail, a National Scenic Byway and 518-mile driving route, which extends along the Lake Erie and Niagara River waterfront. The railroad borders I-190 to the west, and views of the Black Rock Canal (segregated from Lake Erie by Bird Island Pier) are obstructed by landscaping and developments. To the north, views to the west include Lasalle Park and industrial/waterfront uses, including a Frank Lloyd Wright boathouse and marinas/boat clubs. The railroad extends northeast under the elevated I-190 highway and continues north under the Peace Bridge (MP QDN4.6), between I-190, at the edge of Black Rock Canal, and Route 266. The Great Lakes Seaway Trail follows Route 266 where it is set back from the railroad along the canal from MPs QDN4.8 to QDN6.3. Steep slopes and vegetation obscure views from the railroad in some locations of Route 266 businesses. Where slopes flatten, views from the railroad include the nearby canal, adjoining Squaw Island, and businesses on Route 266. The railroad extends inland under the I-190/Route 198 Interchange (MP QDN6.2), between a transmission line right-of-way (that extends north to MP QDN8), on the west, and industrial uses on the east. The viewshed includes industrial uses along the railroad through the remainder of the city of Buffalo and town of Tonawanda. The railroad crosses I-290 at MP QDN10.75, and extends through flat industrial areas/institutional areas at-grade passing into the outskirts of the city of Tonawanda. The railroad continues north on elevated, forested embankment through the remainder of the city, where the views consist of more densely developed residential and commercial buildings and institutions in neighborhoods adjoining

the railroad. The railroad passes over the Erie Canal/Ellicott Creek at MP QDN12.7 and the Erie Canal at a swing span bridge (MP QDN13.4).

Entering **Niagara County** (MPs QDN13 to QDN28), the railroad passes through the Gateway Park on the Erie Canal and continues on a raised forested embankment through densely developed neighborhoods in the city of North Tonawanda, and continues at-grade through less densely developed industrial areas approaching the riverfront to the north. Although the railroad extends close to the riverfront off Tonawanda Island, views of the Little River are obstructed by industrial buildings. Continuing north, the views from the railroad include industries and more densely developed neighborhoods on the east. Where the railroad extends alongside Routes 265/384 (River Road) and Gratwick Riverside Park (MP QDN15.7), the Niagara River is visible, and lands on the east side become more sparsely developed, transitioning to farmlands and forestlands at the outskirts of the city. The Great Lakes Seaway Trail follows River Road where it closely adjoins the railroad in this area (MPs QDN15.5 to QDN16.8). To the north, outside the city limits, views of the riverfront are obscured by forest vegetation and residences, and the railroad turns north, with viewsheds predominantly consisting of agricultural and forestlands, with scattered residences and businesses visible from the tracks, as the railroad extends north through the rural/suburban areas between the major metropolitan areas. Approaching the city of Niagara Falls, the viewshed becomes more urban. The railroad crosses under I-190 near a transmission line right-of-way in the vicinity of a tow lot and trailer/industrial storage yard, and then extends north of the Niagara Falls yard to the Niagara Falls Station (MP QDN27).

Views from the Railroad: 125 Study Area

In **Rensselaer County** (MPs QH142 to QH143), Alternative 125 would follow along the existing the Empire Corridor north to the Albany-Rensselaer Station, then would continue south to a new crossing of the Hudson River. The views along this mile would be largely residential and industrial, along with the views of the Hudson River to the west.

In **Albany County** (MPs QH143 to QH157), the 125 Study Area extends through industrialized waterfront, then would follow interstate highways between MP QH144, at the I-787 convergence with the New York State Thruway (I-87) (to MP QH145), and MP QH157 at the Schenectady County line. The majority of the areas adjoining the highway consist of forested, undeveloped areas, particularly south of the interstate highway, with urban development clustered at interchanges. The New York State Thruway and I-787 extend through the outskirts of the city of Albany, forming a dividing line between the urban areas of the city, on the north, and largely undeveloped areas and parks on the south, including Albany Pine Bush State Unique Area and a golf course. The viewshed along the highway is heavily buffered by forest along the majority of the highway right-of-way, and the median along the New York State Thruway consists of grass and becomes wide and forested in many locations, particularly on the west end of the county. Views of adjoining properties are limited, but adjoining buildings and urban areas are more visible within the city of Albany, on the east end of the county.

Entering **Schenectady County** (MPs QH157 to QH174), the 125 Study Area continues to follow the New York State Thruway (I-90) to MP QH159. The corridor extends north of I-90 alongside industrial and residential areas, passing along the outskirts of the more urbanized area in the town of Rotterdam, crossing west again across I-90 and I-88 between MPs QH161 and QH162. To the west, the 125 Study Area extends through primarily undeveloped forested or farmlands, extending across only six low-density development roads in the seven miles until the corridor approaches and extends

across U.S. Route 20. The corridor parallels the highway to the south, and extending across crossroads that intersect the highway to the north, crossing into Schoharie County at Schoharie Creek.

In **Schoharie County** (MPs QH174 to QH180.7), the corridor continues adjacent to, and south of, U.S. Route 20, a New York State scenic byway, over a distance of approximately 8.5 miles, crossing northwest across the highway at MP QH177.5. The corridor extends through primarily forested and agricultural lands, with scattered developments close to crossing roads. West of MP QH178, where the corridor crosses Routes 162/30A and an intersecting road, north of U.S. Route 20, the corridor crosses only two more crossroads where it extends west to the county line, passing primarily through forested, undeveloped lands.

In **Montgomery County** (MPs QH180.7 to QH202), the 125 Study Area extends through predominantly rural agricultural and forested areas that bypass urban areas and villages. The corridor crosses 19 through roads, of which only five are state highway routes, and viewsheds of buildings are largely restricted to development along these crossroads. However, many buildings may be shielded from view by forest and vegetated buffers. Forested areas are more prominent on the eastern part of the county, and the viewsheds in the western half consist primarily of farmlands.

In **Herkimer County** (MPs QH202 to QH227.3), the viewsheds consist predominantly of rural agricultural and forestlands, where the corridor crosses the northernmost portion of the county. The majority of urban views (cross streets and buildings) are in the central portion of the county, where the corridor crosses the southern outskirts of the village of Ilion. The corridor crosses approximately 23 through roads, of which seven are numbered state routes.

The 125 Study Area would provide views of primarily rural agricultural and forested lands in **Oneida County** (MPs QH227.3 to QH249.3). The corridor would cross 28 through roads, of which nine are state routes. The corridor extends through the outskirts of the city of Sherrill on the western end of the county.

In **Madison County** (MPs QH249.3 to QH264), the corridor would provide views of largely rural forested and agricultural lands, passing through relatively undeveloped lands on the outskirts of the city of Oneida. The buildings and developments are largely restricted to the seventeen through roads, including two state routes, that the corridor would cross. The corridor would also cross through the Old Erie Canal/Erie Canal State Park at MPs QH 260.1 and QH262.3.

In **Onondaga County** (MPs QH264 to QH295.6), the 125 Study Area provides views of primarily agricultural and forested areas where it extends through the eastern part of the county, rejoining the 90/110 Study Area (MP 283) at MP QH268.7, on the south side of the rail yard. Views of buildings and development are limited largely to the five through streets crossed by the corridor. The corridor passes over the Old Erie Canal/Erie Canal State Park at MP QH265.8. The 125 Study Area follows the 90/110 Study Area through downtown Syracuse, as described in the previous section. Just east of the Camillus Airport, the 125 Study Area deviates from the 90/110 Study Area (MP 297.5) to the northwest (at MP QH284), extending through primarily rural agricultural and forested lands, with development largely restricted to the 14 through roads and one state highway that the corridor would cross. The corridor would also cross the New York State Thruway (I-90) at MP QH286.2.

In **Cayuga County** (MPs QH295.6 to QH306.6), the viewshed consists primarily of rural agricultural and forested lands, with development largely limited to buildings on the 13 through roads and two state highways.

In **Wayne County** (MPs QH306.6 to QH342), the corridor crosses the Erie Canal/Seneca River at the eastern county line. The viewsheds in the county consist largely of farm or forestlands through this rural landscape. Development is very low-density, and views of buildings would largely be restricted to the 47 local roads and 7 state highways crossed by the corridor.

In **Monroe County** (MPs QH342 to QH371.6), the 125 Study Area extends through primarily residential neighborhoods, crossing Route 31F, which is fronted by commercial uses before rejoining the 90/110 Study Area (MP 360.8) at MP QH345.25 near the Fairport Village line and following the railroad to MP QH361. The viewsheds consist largely of rural agricultural or forestland, with buildings primarily located along the 15 roads, and 2 state highways along the corridor. The 125 Study Area diverges from the 90/110 Study Area (MP 376.5) just east of the I-490 crossing west of the city of Rochester. The corridor crosses through more urban/industrial viewsheds closer to the interstate, but extends through largely forested viewsheds, with more rural agricultural lands to the west. Residential developments and buildings are more visible along the five state highways and the six through roads, although the corridor extends through or near other residential developments.

In **Genesee County** (MPs QH371.6 to QH401.4), the viewsheds consist primarily of rural agricultural and forested rural landscapes. Views of buildings and development are largely restricted to the 23 through roads crossed by the corridor and the five state highways.

In **Erie County** (MPs QH401.4 to QH426), the viewsheds consist of rural agricultural and forested landscape, extending through one trailer park and becoming more residential to the west. Where the 125 Study Area turns south, crossing the New York State Thruway at MP QH410.5, views of more urban, commercial/industrial areas are more prominent along Route 31 and where the corridor merges with the 90/110 Study Area (MP 427) at MP QH413.

16.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.17). The potential effects of the Base Alternative and the other Build Alternatives are described in more detail below.

16.2.1 Base Alternative

The Base Alternative will maintain weekday service frequencies. Because proposed work with this alternative were anticipated to be located entirely within the right-of-way, no substantial changes to views from or to the railroad were anticipated. The Tier 1 Draft EIS addressed the potential visual impacts of the eight projects included in the Base Alternative.

16.2.2 Alternative 90A

It is anticipated that work will be contained within the right-of-way, and, for the most part, for track and signal improvements, no significant changes in the visual appearance of railroad facilities, or views from the railroad, are anticipated. There are six Scenic Areas of Statewide Significance in the vicinity of Alternative 90A improvements. As described in detail under Section 4.11.4 (“Coastal Resources”), no changes in the visual quality of these SASSs would occur as a result of Alternative 90A.

New station buildings would be constructed at Amsterdam and Buffalo-Depew stations. These station improvements proposed under Alternative 90A are anticipated to improve the appearance of these facilities. Replacement of the Livingston Avenue Bridge may also change the appearance of this crossing, depending on the configuration of the improved historic rail bridge.

16.2.3 Alternative 110

Empire Corridor South

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, are proposed, and additional parkland impacts are not anticipated to occur.

Empire Corridor West/Niagara Branch

Similar to Alternative 90B, the additional track improvements would involve a nominal change in the appearance of the railroad, where areas of third and fourth tracks are proposed to be added, as an additional third or fourth track will likely not be highly visible. In many locations, the tracks are not visible from adjoining properties or vantage points, unless the trains are running on them, or the right-of-way is screened by vegetation, buildings, or slopes. The views from the tracks should not change markedly with the proposed improvements. However, the additional tracks may involve clearing of forest, or property changes/impacts, which may change views to and from the tracks. Compared to Alternative 90A, Alternative 110 would involve third tracks that would be offset an additional 15 feet from the existing tracks, for a total offset of 30 feet, so Alternative 110 may involve additional clearing and property impacts and may be more visible than Alternative 90B. There would also be more frequent service than for the Base Alternative (although the same frequency of service as Alternative 90B) and trains running on the new tracks would be closer to adjoining properties. Alternative 110 would also involve a greater length of fourth track, compared to Alternative 90A. In addition, Alternative 110 would involve more modifications to some bridges than Alternative 90A, which could involve nominal changes in the appearance of the affected crossings.

The Revolutionary Trail Scenic Byway (Route 5/29) extends alongside the length of the Empire Corridor and the Mohawk River/Erie Canal from Route 5 in Schenectady County to Herkimer, then follows Route 5S and the Erie Canal to Utica and continues northwest along Route 49 and the Erie Canal to Rome in Oneida County. Portions of Route 5 would need to be relocated, however, the scenic qualities of the byway would not be affected by Alternative 110.

Alternative 110 proposes two flyovers along the corridor, at MP 279 and MP 366 (same as the ones proposed in 90B). The first flyover (MP 279) would extend through lightly forested and rural agricultural land, with scattered residences set back at least 500 feet and an at-grade road crossing set back 700 feet. Currently it is not known how tall or extensive the flyovers will be, but this would introduce a new visual element that may not be visible from the closest houses, depending on the lateral and vertical extent of the structure.

Lightly forested land surrounds the proposed location for the second flyover (MP 366), with residential areas just a few hundred feet southwest of the existing railroad and parkland to the north. This flyover will be situated north of the I-490 & 441 interchange. Depending on the height of the flyover, the flyover may be visible from residential areas and the adjoining parkland, and would introduce a new visual element that would be more prominent than the at-grade railroad.

16.2.4 Alternative 125

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River. This would introduce a new visual element and a new crossing of the Hudson River, but the area affected is primarily industrial or undeveloped.

Empire Corridor West/Niagara Branch

Alternative 125 also would include new right-of-way in most areas, but would merge back with the Empire Corridor over two 15- and 16-mile segments centered on Syracuse and Rochester, respectively, and along the section approaching Buffalo Exchange Street. In these sections, the track would be elevated. Alternative 125 would be an electrified corridor between Albany and Buffalo, with overhead catenary, which may be more visible from adjoining properties and roads.

This route covers 126 miles on new alignment between Rensselaer County and a point 8.5 miles east of Syracuse Station. Alternative 125 extends through urban areas in Albany and Schenectady Counties over a distance of 20 miles, following the New York State Thruway (I-87/I-90) over most of this distance. Along five areas of Alternative 125, covering a total of 66 miles, it is assumed that grade separation will be achieved by elevating the tracks above the existing grade on a combination of embankment and elevated structures. For estimating purposes, it is assumed that 37.5 miles of viaduct structure will be required to achieve grade separation. Included in the five areas is a stretch of corridor that will likely have grade separated structures to traverse the local terrain, but it is not yet known where, only that they will exist. These elevated portions of the corridor would likely represent new visual elements that would be more prominent to adjoining uses.

Alternative 125 would introduce a new visual element where the route would extend on a new alignment. In these locations, it would have a more substantial visual effect than Alternatives 90B and 110, which would involve improvements to the existing railroad. However, the majority of the areas traversed are rural and agricultural, and the views of the new facility would be limited largely to adjoining properties or crossroads, which are described under “Existing Conditions.” As is the case for the existing railroad, views of and from the tracks may be screened to some degree by trees and vegetated buffers. Although the tracks themselves may not be visible from adjoining properties, depending on the degree of screening and slopes and adjoining development, unless trains are running on the tracks, the overhead catenary may be more visually prominent.

As described under “Existing Conditions,” the new alignment for the Alternative 125 would involve far fewer crossings of interstate highways and the New York State Canal System or urban areas than the existing railroad. New bridges that may be required to carry the railroad over/under roadways may be more prominent visually, and new bridges over rivers/canals would introduce a new river crossing that may be more visible than the tracks at-grade.

Alternative 125 mph would cross and extend alongside an 8.5-mile section of the U.S. Route 20 Scenic Byway, a National Scenic Byway, in Schenectady and Schoharie Counties. This would introduce a new visual element to the byway, but would affect a very small proportion of the entire 108-mile driving route.

The following section describes the five general locations where elevated sections would be required for Alternative 125. Where the alignment rejoins the Empire Corridor, most of the areas consist of more densely populated and urban areas, and Alternative 125 would be elevated above the existing tracks. Overhead catenary along this electrified corridor will be particularly visible in these sections.

The easternmost elevated section along the Alternative 125 extends between the City of Rensselaer (MP QH142) and MP QH162 in Schenectady County. Along this 20-mile section, it is assumed that grade separation will be achieved by elevating the tracks above the existing grade on a combination of embankment and elevated structures. For estimating purposes, it is assumed that ten miles of viaduct structure will be required to achieve grade separation. These viaduct sections are assumed to be about 20 feet above existing grade. The heights of the non-structurally elevated sections are currently unknown, but the elevated section will be more visible from adjoining areas. In Rensselaer County (MPs QH42 to QH143), Alternative 125 would follow along the existing corridor centerline, but would be elevated. The elevated section along this mile would extend adjacent to residential and industrial uses, and Alternative 125 would cross industrial lands, where it extends towards the Hudson River on a new alignment. In Albany County (MPs QH143 to QH157), Alternative 125 would extend through industrialized waterfront, then would follow interstate highways between MP QH144, at the I-787 convergence with the New York State Thruway (I-87) (to MP QH145), and QH157 at the Schenectady county line.

The elevated section of Alternative 125 will introduce a new visual element, however, most of the section extends along the median of the New York State Thruway (I-90/I-87), which is buffered by trees and has a wide median and right-of-way through the majority of this area. The last five miles extend into Schenectady County and outside the highway right-of-way, extending alongside I-90 to just west of the I-90 and I-88 interchange. Over the last three miles, the railroad will cross over and extend outside of the Thruway right-of-way, crossing through or adjacent to several residential neighborhoods, but also extending through undeveloped or commercial land uses.

Between Schenectady County (MP 165) and Syracuse, because of grade differences of the terrain, intermittent viaduct or elevated structures may be required, although these have not been identified in Tier 1. Since these structures are to span over local terrain, it is likely that they will not be in urban areas and are likely to be in more undeveloped or even industrial and residential areas.

The third elevated section is between MPs QH268 to QH288 in Onondaga County and primarily runs along the existing Empire Corridor, where it extends through the City of Syracuse. This entire distance will likely be completely grade separated on viaduct or column structures, with 10 miles of elevated sections assumed on either side of the Syracuse Station. The railroad extends through rural agricultural and residential areas outside of the city and extends through increasingly urbanized and industrial/commercial areas in and around the City of Syracuse. The views along this section are largely residential and commercial, and would likely be more visible from the grade separated corridor than the current at-grade centerline. This would introduce a new visual element that would be more prominent in this urban area.

The fourth elevated section is where Alternative 125 rejoins the Empire Corridor and extends through the City of Rochester in Monroe County between MPs QH345 to QH361. Approximately ten miles around the Rochester station-stop were assumed to be completely grade separated on viaduct or column structures, about 20 feet above existing grade. The other six miles were assumed to be on embankment, the heights of which are currently unknown. The elevated section starts where Alternative 125 rejoins the Empire Corridor (90/110 Study Area) at MP QH345.25 near the Fairport

Village line. This elevated section would extend through increasingly urban areas entering the City of Rochester, where the viewshed is dominated by built up areas, and the railroad adjoins parking lots, businesses, and industries with limited or no screening by trees. Alternative 125 will be more visible on the elevated tracks than the existing at-grade corridor, but adjoining areas are predominantly commercial or industrial uses or institutional uses.

The fifth elevated section is between MPs QH420 to QH425, entirely along the last five miles of the Empire Corridor where it approaches the Buffalo Exchange Street Station. This section will be elevated on completely grade separated viaduct or column structures and will introduce a new visual element that will be more visible than the current at-grade railroad. This section extends through heavily urbanized, industrialized areas (including the Frontier railyard and the Buffalo Terminal) that include higher density neighborhoods. In the downtown area, this elevated section would extend between commercial buildings on Exchange Street, to the north, and the elevated Niagara Thruway (I-190) structure, on the south. In this area, the elevated structure would mirror the adjoining Thruway bridge and would be less prominent.

17. Farmlands

17.1 Existing Conditions

17.1.1 Empire Corridor South

The Empire Corridor South extending north from (and including) New York through the Hudson Valley to Rensselaer County includes three urbanized counties. All of the Build Alternatives follow the existing Empire Corridor South for the majority of its length, deviating only in Rensselaer County, where Alternative 125 splits off 1.6 miles south of where the existing Empire Corridor turns to the west. The study area within the seven counties of Empire Corridor South contains 405 acres of prime farmland (31 additional acres of prime farmland if drained), 393 acres of farmland of statewide importance, and 387 acres of Agricultural Districts.

The study area within New York, Bronx, and Westchester Counties is urbanized as defined by the U.S. Census Bureau and therefore, by definition does not contain federally protected prime farmland. There are also no prime farmland soils mapped in New York and the Bronx, and there are 59 acres mapped in **Westchester County**, but these do not meet the federal definition of protected prime farmland since Westchester County is within a Census-defined urbanized area. There are no Agricultural Districts within these three urbanized counties.

Putnam County is not defined as an urbanized area, but the portion of the county within the study area contains only 9 acres of prime farmland, one acre of prime farmland if drained, and one acre of farmland of statewide importance. There are no Agricultural Districts in the study area in Putnam County.

More than half of **Dutchess County** in the study area is within a Census-defined urbanized area, and the remaining areas contain 120 acres of prime farmland, 21 acres of prime farmland if drained, and 233 acres of farmland of statewide importance. Dutchess County also has 112 acres within state-designated Agricultural Districts. About one-third of Columbia County within the study area is an urbanized area, and most of the mapped farmland soils are situated outside the urbanized area. In **Columbia County**, there are 69 acres of prime farmland (7 acres of prime farmland if drained), 102 acres of farmland of statewide importance, and 148 acres within Agricultural Districts.

Roughly half of the study area in **Rensselaer County** is within an urbanized area where the 90/110 and 125 Study Areas diverge, and the remaining area contains 148 acres of prime farmland, and 17 acres of farmland of statewide importance. There are 126 acres within Agricultural Districts in Rensselaer County.

17.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

The Empire Corridor West and Niagara Branch extending west of (and including) Albany to Niagara Falls includes large tracts of agricultural land within the 600-foot-wide study area. The study area in the thirteen counties contains a total of 3,610 acres of prime farmland, an additional 1,952 acres of prime farmland if drained, and 1,647 acres of farmland of statewide importance. Approximately 3,280 acres of the study area between (and including) Albany County and Niagara County are within state-designated Agricultural Districts.

Albany County is within an urbanized area; however, there are 8 acres of prime farmland and 26 acres of farmland of statewide importance within this county. There are no Agricultural Districts in the study area within Albany County.

Most of **Schenectady County** lies within an urbanized area, and the remaining areas contain 163 acres of prime farmland, and 39 acres of farmland of statewide importance. There are 12 acres within Agricultural Districts in the study area in Schenectady County. The study area in **Montgomery County** is primarily rural and contains 484 acres of prime farmland (an additional 6 acres if drained) and 88 acres of farmland of statewide importance. Within Montgomery County, approximately 610 acres are within Agricultural Districts. **Herkimer County** has urbanized areas that follow the rail corridor, and contains 328 acres of prime farmland, 4 acres of prime farmland if drained, 19 acres of farmland of statewide importance, and 159 acres are within Agricultural Districts.

More than two-thirds of the rail corridor in **Oneida County** consists of urbanized areas around the cities of Utica and Rome. The remainder of the Oneida County within the study area contains 295 acres of prime farmland, 270 acres of prime farmland if drained, and 87 acres of farmland of statewide importance. The area within 300 feet of the corridor centerline in Oneida County contains 24 acres within Agricultural Districts. Approximately half of the rail corridor in **Madison County** consists of urbanized areas within the city of Oneida, but the remainder contains 133 acres of prime farmland (an additional 193 acres of prime farmland if drained), and 154 acres of farmland of statewide importance. The study area in Madison County contains 132 acres within Agricultural Districts.

Almost half of the study area in **Onondaga County** consists of urbanized areas surrounding the city of Syracuse, but the remaining area contains 351 acres of prime farmland, 256 acres of prime farmland if drained, and 169 acres of farmland of statewide importance, for a total of 776 acres of farmland. There are 39 acres within Agricultural Districts within the county. **Cayuga County** is predominantly rural and agricultural. The study area within Cayuga County contains 266 acres of prime farmland, 24 acres of prime farmland if drained, 284 acres of farmland of statewide importance, and 223 acres within Agricultural Districts.

Wayne County is primarily rural and agricultural, with 609 acres of prime farmland, 138 acres of prime farmland if drained, and 268 acres of farmland of statewide importance. The county contains

1,004 acres within Agricultural Districts.

Most of **Monroe County** within the study area consists of urbanized areas surrounding the city of Rochester, but the remaining area contain 155 acres of prime farmland, 214 acres of prime farmland if drained, and 33 acres of farmland of statewide importance. The areas within 300 feet of the corridor centerline in Monroe County include 118 acres within Agricultural Districts.

Genesee County within the study area is primarily rural and agricultural and areas within 300 feet of the corridor centerline contain 755 acres of prime farmland, 463 acres of prime farmland if drained, and 338 acres of farmland of statewide importance. There are 650 acres within Agricultural Districts within the study area in Genesee County.

Most of **Erie County** within the study area consists of urban areas surrounding the cities of Buffalo, Tonawanda, and Niagara Falls, but the remainder of the study area within the county contains 60 acres of prime farmland, 332 acres of prime farmland if drained, and 133 acres of farmland of statewide importance. There are 225 acres within Agricultural Districts within the study area in Erie County. All of **Niagara County** along the remainder of the Niagara Branch consists of urbanized area, although there are 3 acres of prime farmland, 52 acres of prime farmland if drained, and 9 acres of farmland of statewide importance within the 600-foot wide study area. There are also 84 acres within Agricultural Districts in Niagara County.

17.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

The 125 Study Area follows a more direct route between Rensselaer and Buffalo, which bypasses several of the major metropolitan areas and stations sites (Schenectady, Amsterdam, Utica, and Rome) along the Empire Corridor West and extends through more rural and agricultural areas. Within the 600-foot wide study area of the 125 Study Area in the Empire Corridor West/Niagara Branch, there are fourteen counties containing a total of 5,139 acres of prime farmland, an additional 3,346 acres of prime farmland if drained, and 3,076 acres of farmland of statewide importance. Approximately 7,779 acres of the study area between (and including) Albany County and Niagara County are within state-designated Agricultural Districts.

As noted above, **Albany County** is within an urbanized area. However, there are 64 acres of prime farmland and 89 acres of farmland of statewide importance in this county within the 125 Study Area. Albany County does not include any Agricultural Districts within the 125 Study Area.

The 125 Study Area follows a more southerly, rural route through **Schenectady County**, with the exception of the eastern third of the route, which lies within an urbanized area. The remaining areas contain 56 acres of prime farmland (an additional 403 acres if drained), and 263 acres of farmland of statewide importance. There are 159 acres within Agricultural Districts within the 125 Study Area in Schenectady County.

The 125 Study Area passes through **Schoharie County**. The study area in the county contains 132 acres of prime farmland (an additional 104 acres if drained), and 79 acres of farmland of statewide importance. Within Schoharie County, approximately 25 acres are within agricultural districts.

The study area in Montgomery and Herkimer counties bypasses urban areas along the Empire Corridor in Amsterdam and Herkimer and other communities that developed along the railroad. The study area in **Montgomery County** is primarily rural and contains 56 acres of prime farmland (an additional 770 acres if drained) and 488 acres of farmland of statewide importance. Within

Montgomery County, approximately 1,078 acres are within Agricultural Districts. **Herkimer County** along the 125 mph rail corridor is predominantly rural, and contains 216 acres of prime farmland (an additional 286 acres if drained), 460 acres of farmland of statewide importance, and 82 acres of Agricultural Districts.

The 125 Study Area bypasses the cities of Utica and Rome, although the eastern half of the study area extends through urbanized areas to the south of these cities. The remainder of **Oneida County** within the study area contains 827 acres of prime farmland, 357 acres of prime farmland if drained, and 111 acres of farmland of statewide importance. The area within 300 feet of the 125 Study Area corridor centerline in Oneida County contains 374 acres within Agricultural Districts.

Although the 125 Study Area bypasses the city of Oneida, almost half of the rail corridor in **Madison County** consists of urbanized areas surrounding the city. The remainder of the county contains 244 acres of prime farmland (an additional 60 acres of prime farmland if drained), and 335 acres of farmland of statewide importance. The study area in Madison County contains 366 acres within Agricultural Districts.

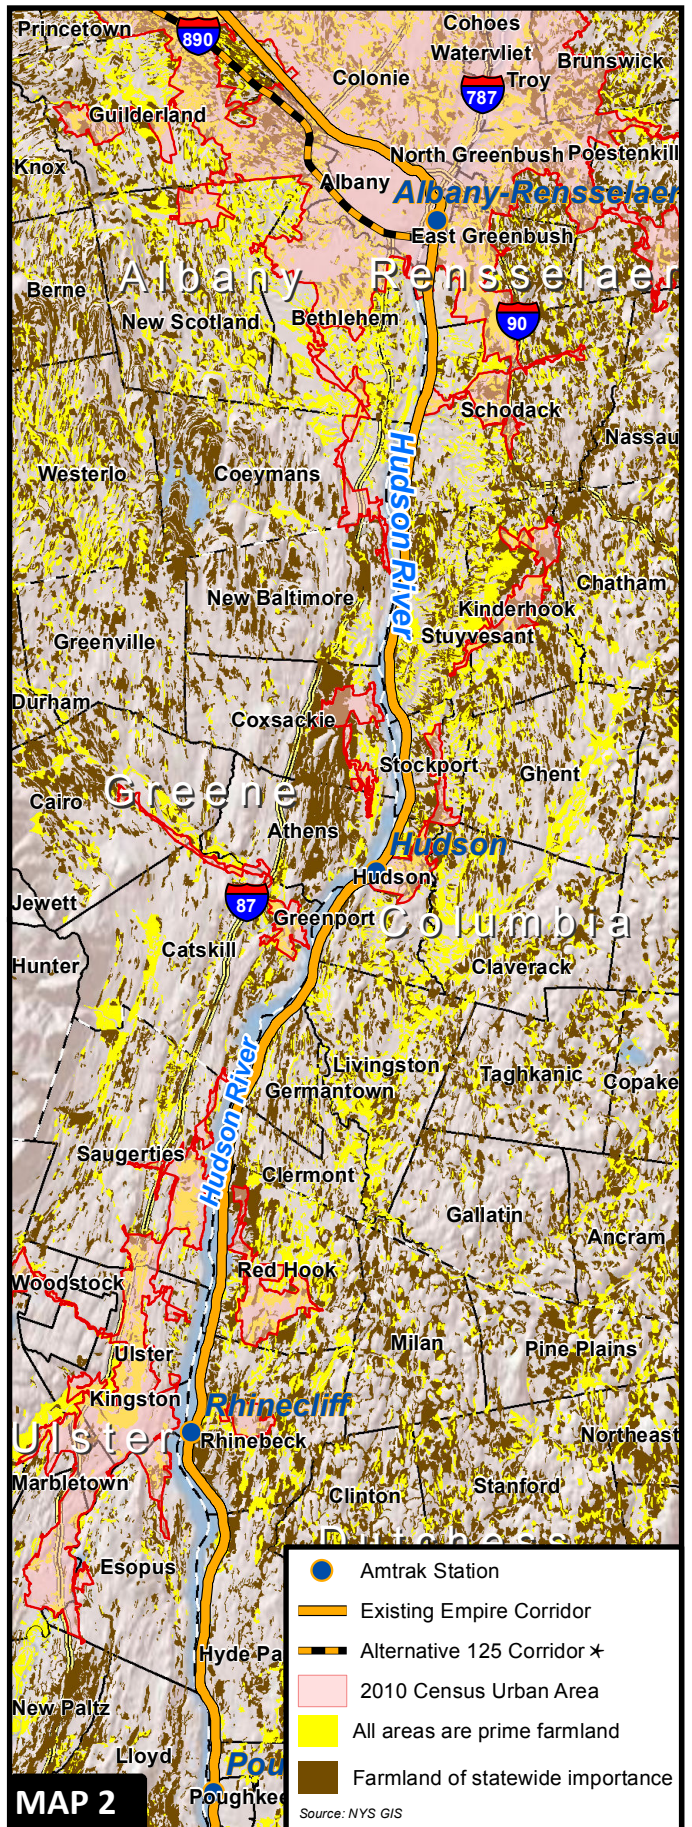

The 125 Study Area parallels and merges with the Empire Corridor West in **Onondaga County** through the Syracuse area. Almost half of the study area in Onondaga County consists of urbanized areas surrounding the city of Syracuse, but the remaining area contains 473 acres of prime farmland, 140 acres of prime farmland if drained, and 319 acres of farmland of statewide importance, for a total of 932 acres of farmland. There are 464 acres within Agricultural Districts within the county.

The 125 Study Area takes a more northerly route bypassing the existing railroad corridor through Cayuga and Wayne counties. Cayuga and Wayne counties are predominantly rural and agricultural. The 125 mph study area within the **Cayuga County** contains 362 acres of prime farmland, 90 acres of prime farmland if drained, 160 acres of farmland of statewide importance, and 806 acres within Agricultural Districts. The study area in **Wayne County** contains 1,246 acres of prime farmland, 298 acres of prime farmland if drained, and 271 acres of farmland of statewide importance. The county contains 2,214 acres within Agricultural Districts.

The 125 Study Area bypasses the Empire Corridor West to the north and merges with the existing rail corridor through the Rochester area, before splitting off to the north again on the west end of the county. Most of **Monroe County** within the study area consists of urbanized areas surrounding the city of Rochester, but the remaining area contains 215 acres of prime farmland, 76 acres of prime farmland if drained, and 43 acres of farmland of statewide importance. The areas within 300 feet of the 125 mph corridor centerline in Monroe County include 267 acres within Agricultural Districts.

The 125 Study Area extends on a more northerly route through **Genesee County**, bypassing an urban area in Batavia. Genesee County within the 125 mph study area is primarily rural and agricultural and areas within 300 feet of the 125 mph corridor centerline contain 1,002 acres of prime farmland, 427 acres of prime farmland if drained, and 369 acres of farmland of statewide importance. There are 1,476 acres within Agricultural Districts within the 125 mph study area in Genesee County.

The 125 Study Area turns south to merge with the Empire Corridor West five miles east of the Buffalo-Depew Station in eastern Erie County. Most of **Erie County** within the study area consists of urban areas surrounding the cities of Buffalo, Tonawanda, and Niagara Falls, but the remainder of the 125 mph study area within the county contains 243 acres of prime farmland, 283 acres of prime farmland if drained, and 80 acres of farmland of statewide importance. There are 384 acres within

Agricultural Districts within the study area in Erie County. All of **Niagara County** along the remainder of the Niagara Branch consists of urbanized areas, although there are 3 acres of prime farmland, 52 acres of prime farmland if drained, and 9 acres of farmland of statewide importance in the 125 Study Area. There are also 84 acres within Agricultural Districts in Niagara County.

17.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.18). The potential effects of the Base Alternative and the other Build Alternatives are described in more detail below.

17.2.1 Base Alternative

The Base Alternative will maintain weekday service frequencies. The work for the Base Alternative were largely contained within the former track bed and the existing right-of-way. The Tier 1 Draft EIS addressed the potential farmland impacts of the eight projects included in the Base Alternative.

17.2.2 Alternative 90A

Empire Corridor South

Alternative 90A includes construction of 4 miles of second track through urbanized areas of Manhattan (MPs 9 to 13), and 1.4 miles of new track, extending under the Tappan Zee Bridge, for the Tarrytown Pocket Track/Interlocking. Both of these are located within designated urban areas and would not impact protected farmland.

With Alternative 90A, signal improvements proposed along 43 miles (MPs 32.8 and 75.8) extend through urban areas (Westchester and Dutchess Counties) or limited areas of prime farmland (Putnam County). There is only one location close to an Agricultural District, but work will be contained within the right-of-way and no protected farmland impacts are expected. Along this section, 10 miles of new third track (MPs 53 to 63) and improvements at the Poughkeepsie Yard/Storage Facility (MPs 71 to 75.8) would be located within urban areas in Dutchess County.

North of Poughkeepsie and south of Albany-Rensselaer Station (MPs 75.8 to 140), proposed improvements would include rock slope stabilization (MPs 105 to 130) and three new control points (CP 82, CP 99, and CP 136), as well as station improvements at Rhinecliff Station (high-level platforms) and Hudson Station (new Ferry Street Bridge and track realignments). These improvements would occur largely within the right-of-way and would not impact protected farmland. Alternative 90A includes replacement of the Livingston Avenue Bridge, which is in an urban area on both sides of the Albany County Line and would not impact protected farmland.

Empire Corridor West/Niagara Branch

With Alternative 90A, track improvements include approximately 10 miles of third track between MPs 169 and 178.5, and Amsterdam Station improvements along the west end of this segment. The western five miles of this segment extends through a designated urban area. The remaining five miles in eastern Montgomery County and extending into Schenectady County includes areas of prime farmland and extends close to Agricultural Districts in a few locations. However, this work could be contained within the existing right-of-way. Upgrades to interlockings and automatic block signals at three control points (CP 175, CP 239, and CP 248) will not affect prime farmlands or Agricultural Districts, as these are all located within urban areas.

Alternative 90A includes Syracuse Station track improvements (MPs 290 to 294) and third track improvements along 11 miles (MPs 373 to 382) west of the station. These work areas in Syracuse and Rochester are entirely within designated urban areas and do not adjoin Agricultural Districts. These Alternative 90A improvements would not impact protected farmland. Further to the west, the addition of a third track along 11 miles located largely west of the designated urban area around Rochester, and work outside of the right-of-way may affect prime farmlands and Agricultural Districts. However, the majority of the work would be located within the right-of-way.

Station improvements at the Buffalo-Depew Station would be located within an urban area, and no Agricultural Districts are located in this area. Although the proposed double track (MPs QDN17 to QDN23.2) along the Niagara Branch is located within an urban area, work outside the right-of-way in this area may affect Agricultural Districts.

17.2.3 Alternative 110**Empire Corridor South**

No additional work within Empire Corridor South, other than that proposed for Alternative 90A, is proposed, and farmland impacts are not anticipated to occur.

Empire Corridor West/Niagara Branch

With Alternative 110, track realignments outside of the right-of-way would be required near MP 165 in Schenectady County, but this would be located within an urban area and would not impact protected farmland. The connection of the third track to Selkirk Branch at MP 168 may affect mapped areas of prime farmlands and borders on an urban area, south of the railroad. There are no Agricultural Districts that would be affected.

Work extending outside of the right-of-way for construction of the third and fourth tracks and a maintenance service road at MP 182 in Montgomery County may affect prime farmlands and Agricultural Districts. West of the urban area around Fonda (west of MP 186.85) to MP 189.5, work outside of the right-of-way (maintenance service road and relocated freight track west to turnout at MP 187.8 and third track west of this point) may involve impacts to protected farmland and Agricultural Districts. However, most of the prime farmlands along this section are situated on the opposite (south) side of the tracks. Realignment of the third track at MP 192.5 and a maintenance service road (MPs 194 to 197) may affect prime farmland and Agricultural Districts. Relocation of Route 5, which closely borders this section of the Empire Corridor West, may indirectly affect farmland areas in this and other areas of Montgomery and Herkimer Counties. A maintenance service

road that may extend outside of the right-of-way in certain areas between MPs 197 and 201 and track realignments at MPs 198 and 199.3 are situated within a designated urban area. However, the track realignment at MP 199.3 may affect Agricultural Districts. Track realignment of the new/relocated freight tracks and the third track at MPs 205 and 206 may impact prime farmlands and Agricultural Districts in Montgomery County.

In Herkimer County, the third track and maintenance service road may also affect prime farmlands at MPs 208.3 to 208.5 and between MPs 210 to 213. There are no Agricultural Districts in these areas that would be affected. West of MP 215, the remainder of the tracks in Herkimer County is located within an urban area. In this section, there are areas where the maintenance service road and in some locations, the proposed third track, may extend outside of the right-of-way (MP 215.5, where fourth track will be added, impacts could occur at MPs 218.5 to 219, MP 222, MPs 226.4 to 228, and MPs 229 to 229.8). There are no Agricultural Districts along most of these areas, with the exception of the westernmost area. A maintenance service road in this last section (MPs 229 to 229.8) that may extend along the edge of and outside the right-of-way may affect an Agricultural District and actively farmed fields. A maintenance service road and the proposed third track between MPs 230.4 to 230.9 may involve property takings and relocation of Route 5, indirectly or directly affecting an Agricultural District. Between MPs 231 and 235.3, near the Oneida County line, the addition of a maintenance road and the third track may cross out of the right-of-way in a number of locations, potentially affecting Agricultural Districts.

In Oneida County, the addition of third and fourth tracks and relocated freight track may extend outside of the right-of-way in the section between the county line and Utica Station, but this is within an urban area, and no Agricultural Districts abut the railroad.

In Wayne County, the addition of a third track and maintenance service road may involve right-of-way impacts near MP 341, but this is in an urban area and will not affect Agricultural Districts.

In Genesee County, the new/relocated freight mains north of the existing railroad and a maintenance service road may potentially affect farmlands. Prime farmlands, active farmfields, and structures, and Agricultural Districts may potentially be affected in the area between MPs 389 and 395.

The proposed work in the vicinity of passenger stations at Rome, Syracuse, Rochester, and Buffalo-Depew and addition of tracks near these sites are situated within urban areas and will not affect farmlands.

17.2.4 Alternative 125

Alternative 125 would include a “sealed” corridor with minimal crossings and therefore there may be potential accessibility impacts to active farming operations. Alternative 90A would be situated within the right-of-way and also would involve work within urban areas in many locations, and therefore is not anticipated to impact farmland.

Empire Corridor South

No new improvements, beyond what is proposed for Alternative 90A, would be proposed for Alternative 125 along the majority of Empire Corridor South. However, roughly one mile of the proposed 125 mph track would extend south from Albany-Rensselaer Station to cross the Hudson River, but this is located entirely within designated urban area and would not impact farmland.

Empire Corridor West/Niagara Branch

Alternative 125 would include new right-of-way in most areas, but would merge back with the Empire Corridor over two 15- and 16-mile segments centered on Syracuse and Rochester, respectively. This route covers 126 miles on new alignment between Rensselaer County and a point 8.5 miles east of Syracuse Station. Alternative 125 extends through urban areas in Albany and Schenectady Counties over a distance of 20 miles, following the New York State Thruway (I-87/I-90) over most of this distance. As the area is urban, there are no prime farmlands in this section, although the corridor extends close to or through Agricultural Districts in two isolated locations.

West of the urban area, Alternative 125 extends through or close to eight Agricultural Districts in Schenectady County and one in Schoharie County. Alternative 125 in this area passes through farmlands of statewide significance, and prime farmlands are more limited and dispersed.

Alternative 125 extends through Montgomery County, where Agricultural Districts cover most of the county along the corridor. The distribution of farmlands of statewide importance is much more dispersed, and there are limited occurrences of prime farmlands along the corridor in the county.

In Herkimer County, Alternative 125 crosses three Agricultural Districts, as well as two urban areas surrounding Herkimer and Utica on the west. The distribution of farmlands of statewide importance is dispersed, with even fewer occurrences of prime farmland along the corridor.

In Oneida County, Alternative 125 crosses prime farmland in a number of locations in the county. Alternative 125 also extends through 16 agricultural districts.

In Madison County, Alternative 125 extends through prime farmlands and farmlands of statewide significance in this county. This alternative also crosses five larger Agricultural Districts, which encompass roughly 4 miles of the corridor.

In Onondaga County, the alignment merges with the existing Empire Corridor. West of the Syracuse urban area, Alternative 125 passes through areas of prime farmland, and also crosses or adjoins at least 13 Agricultural Districts in the county,

In Cayuga and Wayne Counties, Agricultural Districts extend along almost the entire length of Alternative 125. Two large Agricultural Districts, and one or two smaller districts, cover the entire length of the corridor of Cayuga County. At least 47 Agricultural Districts coincide with the corridor in Wayne County. The corridor also passes through areas of prime farmlands in both counties, although the western 2.5 miles in Wayne County extends through an urban area.

Alternative 125 extends almost entirely through urban areas in Monroe County (along 16 miles surrounding in the City of Rochester), where it merges with the existing Empire Corridor, diverging again 5.5 miles west of Rochester Station to continue on new alignment 52 miles west to Buffalo. West of the urban area, Alternative 125 passes through farmland on the remaining three miles on the west end of the county, passing through three Agricultural Districts and areas of prime farmland

Alternative 125 extends through or adjacent to at least 25 Agricultural Districts and areas of prime farmland in Genesee County. In Erie County, Alternative 125 extends through one large Agricultural District that covers much of the 6 miles before the corridor enters the urban area.

Alternative 125 continues 5.5 miles past the eastern edge of the urban area to merges back with the existing Empire Corridor/Niagara Branch. This urban area continues along the remainder of the corridor through Buffalo and Niagara Falls, so no farmland impacts are anticipated along this segment of the program.

18. Air Quality

For air quality, the current regulatory standards (NAAQS) and attainment areas are presented in Section 4.19.1 and 4.19.2, and impact assessments for the Preferred Alternative are presented in Section 4.19.4 of the Tier 1 Final EIS.

18.1 Existing Conditions

18.1.1 Monitoring Data

Existing conditions, presented as context for the analyses, are presented based on existing ambient air quality information collected by NYSDEC. The concentrations of all criteria pollutants measured at ambient air quality monitoring stations in areas near the Empire Corridor at the nearest stations available in the various regions, as presented in the Tier 1 Draft EIS, are presented in Exhibit G-31. HAP concentrations in ambient air are not routinely monitored, and existing data is largely relevant only to highly localized sources, and, therefore, is not presented here.

18.1.2 Methodology

Local (Microscale) Air Quality Assessment

On a local scale, the potential effect of the program on air quality is limited to increases in locomotive emissions, and both increases and decreases in on-road emissions. Decreases in on-road emissions could have a beneficial impact on local air quality if large numbers of vehicle trips are shifted to rail, occurring along roadways where those trips would otherwise occur. Since the details of that shift are not known at this time, this potential benefit has not been analyzed; however, the regional analysis includes a more meaningful analysis of the region-wide benefits of this mode shift. Since these trips may have the potential to adversely affect air quality, this effect will be analyzed in subsequent environmental analyses. Therefore, the remainder of this section focuses on the potential local effect associated with increases in locomotive emissions.

In order to assess the need for local air quality analysis, a screening analysis was first performed with the objective of identifying any potential for significant impacts on air quality resulting from rail operations, including all program alternatives (including the Base Alternative). A simplified pollutant dispersion model was created, using AERSCREEN²⁰—U.S. EPA's recommended screening-level air quality model based on the AMS/EPA Regulatory Model Improvement Committee Model (AERMOD). The model produces estimates of worst-case 1-hour concentrations for a single source, without the need for hourly meteorological data, and also includes conversion factors to estimate worst-case 3-hour, 8-hour, 24-hour, and annual concentrations. AERSCREEN is intended to produce concentration estimates that are equal to or greater than the estimates produced by AERMOD with a

²⁰ U.S. EPA, AERSCREEN User's Guide, EPA-454/B-11-001, March 2011, <http://www.epa.gov/ttn/scram/dispersion_screening.htm#aerscreen>.

fully developed set of meteorological and terrain data. The modeling followed the general procedures outlined in the Guideline on Air Quality Models (referred to as Appendix W).²¹ The model was run for both rural and urban conditions.

Notes:			
1. NYS DEC, New York State Ambient Air Quality Report (2013, 2017).			
NA Not Available			
Concentrations are presented in the statistical form defined in the NAAQS: Short-term average PM ₁₀ , CO, and SO ₂ 3-hour concentrations are the second-highest of the year. SO ₂ 1-hour is the 3-year average of the annual 99th percentile daily maximum 1-hour average concentration. NO ₂ 1-hour is the 3-year average of the annual 98th percentile daily maximum 1-hour average concentration. PM _{2.5} annual concentrations are the average of 2009-2011, and the 24-hour average concentration is the average of the annual 98th percentiles in 2009-2011. 8-hour average ozone concentrations are the average of the 4th highest-daily values from 2009-2011.			
Source: NYSDEC, New York State Ambient Air Quality Data for 2019.			

The dispersion analysis evaluated the total locomotive emissions associated with the full implementation of the program, in 2035, assuming the highest number of daily trips from any alternative—17 and 8 round-trips per day on the southern and western portions of the corridor, respectively. Since the increment is the same on both legs, and the total is almost double on the Empire Corridor South, the analysis focuses on the worst case—the Empire Corridor South. All locomotives associated with program would be newly manufactured model-year 2015 at the earliest, and would therefore be U.S. EPA Tier 4 certified (Tier 4 is the lowest emissions certification available to date, with considerably lower PM and NO_x emissions as compared to lower-tier locomotives). U.S. EPA's in-use Tier 4 locomotive emissions factors were used to calculate emissions.²² Annual NO_x concentrations were conservatively assessed assuming that 75 percent of all NO_x is converted to NO₂ (Appendix W Tier 2 method); this assumption may overestimate NO₂ concentrations by a factor of 6

²² U.S. EPA OTAQ, Emission Factors for Locomotives, EPA-420-F-09-025, April 2009.

or more, in addition to the high level of conservatism built in to the screening procedure, because the maximum concentrations predicted are immediately adjacent to the source, and would therefore not have time to be converted from NO to NO₂ (roughly 90 percent of NO_x emitted from diesel engines is in the form of NO).

Emissions estimates assumed the highest emissions, under two scenarios:

- **Line-Haul**—Emissions along the track, assumes locomotives operating at 100 percent load; and
- **Station**—Emissions immediately adjacent to the station, nearest to the locomotive stopping point. Assumes deceleration into and acceleration out of the station, in addition to idle emissions.

The results of the dispersion analysis are discussed in the context of background concentrations and the NAAQS.

Regional (Mesoscale) Analysis

Criteria Pollutants

The regional (mesoscale) emissions analysis estimates the net change in emissions associated with the program, including the change in both on-road and locomotive emissions. The analysis does not include the vehicle miles traveled (VMT) decrease associated with trips that may be reduced but that do not use the New York State Thruway system. Since these trips would likely not increase rail trips, the analysis is somewhat conservative (i.e., shows lower reductions and higher net emissions).

The local (microscale) analysis section above includes a description of the locomotive emission factors used. Analysts estimated power input using LTK Engineering Services' TrainOps simulation model. The model includes proposed grades, curves, station locations, speed restrictions and switch-related diverging movements specific to the proposed program alternatives. Analysts then calculated emissions for each non-attainment area by multiplying the total power input in horsepower-hour (hp-hr) within the area by the locomotive emission factor for each pollutant.

Analysts obtained on-road emission factors in grams per mile from the New York State Department of Transportation's Environmental Procedures Manual,²³ applying the factors for 2035, based on the representative speeds for each roadway class in each county from New York State Department of Environmental Protection's speed analysis prepared for the 2003 SIP motor vehicle emissions budget update.²⁴ Analysts estimated total vehicle miles-traveled (VMT) for each county and roadway class using the Cube Voyager model—an intercity travel demand model studying the mode share of travel (primary auto, bus, air, and rail) along the Empire Corridor. The mode share is driven primarily by a combination of the total travel time and the associated costs. The VMT were then multiplied by the corresponding emission factor and summed for each non-attainment area.

²⁴ NYSDEC, Motor Vehicle Emissions Budget Update, June 2003, Attachment 17, "Speed Tables".

Hazardous Air Pollutants

The Clean Air Act Amendments of 1990 listed 188 Hazardous Air Pollutants (HAPs) and addressed the need to control toxic emissions from transportation. EPA's 2007 Mobile Source Air Toxics (MSAT) rule identified a subset of seven HAPs as having significant contributions from mobile sources: benzene, 1,3-butadiene, formaldehyde, acrolein, naphthalene, polycyclic organic matter, and diesel particulate matter (DPM). The Federal Highway Administration (FHWA) also considers these the priority MSATs for analysis.²⁵ Analysts assessed MSATs using criteria in the Interim Guidance on Air Toxic Analysis in NEPA Documents, issued February 2006 by FHWA and the September 2009 update. Based on the FHWA guidance, the proposed alternatives do not require a detailed quantitative analysis. Nonetheless, in accordance with the program scope, analysts prepared an estimate of the net change in statewide MSAT emissions.

Since detailed MSAT emission factors for vehicles and locomotives were not available, analysts estimated emissions based on the ratio of the emissions of each pollutant to NO_x emissions from light duty gasoline vehicles and locomotives in New York State. Analysts obtained emissions data for New York State in 2008 for both sources from EPA's National Emissions Inventory.²⁶ The ratio of NO_x to each MSAT pollutant was calculated, and then multiplied by the projected statewide NO_x emission calculated using the above criteria pollutant methodology. Since these ratios are based on statewide locomotive emissions and on 2008 data, they do not reflect Tier 4 locomotives and future (2035) vehicle emissions, and therefore overestimate the emissions benefits (see discussion with results).

18.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered, including the Base Alternative (refer to Sections 4.19). The potential effects of the other Build Alternatives are described in more detail below.

18.2.1 Local (Microscale) Air Quality Assessment

Screening Results

The results of the screening analysis, representing the effect of locomotive emissions along the track and at stations, is presented in Exhibit G-32. This assessment includes both urban and rural dispersion and background concentrations, and are presented separately for the western and the southern sections. As described above, this analysis includes many layers of conservative assumptions, resulting in high-end estimate of potential concentrations. The resulting concentrations are lower than the NAAQS for both annual-average NO₂ and PM_{2.5}—the two critical pollutants for this analysis, indicating that operations of the Preferred Alternative (Alternative 90B) would not result in a significant adverse impact with respect to these standards. Since particulate matter emitted from locomotives is almost entirely PM_{2.5} (and that was the assumption made for the analysis), and since the PM₁₀ standard is higher, with relatively lower background levels, locomotive operations would also not be expected to result in a significant adverse impact on PM₁₀ concentrations.

1-Hour NO₂ National Ambient Air Quality Standard

The U.S. EPA established a new 1-hour average NO₂ standard of 100 parts per billion (ppb), effective April 12, 2010, in addition to the current annual standard. The statistical form is the 3-year average of the 98th percentile of daily maximum 1-hour average concentrations in a year. In 2018, the U.S. EPA reviewed and retained the Primary NAAQS mentioned above and Secondary NAAQS for NO₂ of 53 ppb, annualized mean.

By promulgating the 1-hour NO₂ standard, the U.S. EPA has initiated a process under the CAA that will ultimately result in the adoption of strategies designed to attain and maintain ambient NO₂ concentrations at levels below the standard. This process will first involve installation of additional ambient NO₂ monitoring stations near roadways. With respect to those areas that are identified as in non-attainment, states will be required to develop SIPs designed to meet the standard by specified time frames. In 2010, the U.S. EPA issued new regulations and guidance to address methodologies and criteria for performing assessments of 1-hour NO₂ concentrations from program-level emission sources and for evaluating their impacts.

Uncertainty exists as to 1-hour NO₂ background concentrations at ground level, especially near roadways, since these concentrations have not been measured within the current monitoring network. In addition, there are no clear methods to predict the rate of transformation of NO to NO₂ at ground-level given the level of existing data and models. The U.S. EPA, in promulgating the standard, has expressed specific concern regarding mobile source impacts, and estimated that ambient concentrations of NO₂ adjacent to roadways could be 30 to 100 percent higher than the concentrations measured at community scale (rooftop) monitoring stations.²⁷ Similar concerns may exist regarding areas adjacent to railways.

Therefore, predicted impacts cannot be based on comparison with the new 1-hour NO₂ NAAQS since total 98th percentile values, including local area roadway contributions, cannot be estimated. In addition, methods for accurately predicting 1-hour NO₂ concentrations from railways have not been developed. Given the scale of the NO_x emissions associated with the locomotives, exceedances of the 1-hour NO₂ standard resulting from locomotive operations cannot be ruled out; however, as discussed above, locomotives rated Tier 4 would be used, achieving the lowest practicable NO₂ emissions.

18.2.2 Regional (Mesoscale) Air Quality Assessment

Although the changes are small in the regional context, the net result is a reduction in all pollutants other than NO_x. The minor increase in NO_x emissions is lower than the *de minimis* levels defined in the conformity regulations and would, therefore, be presumed to conform to the applicable SIPs, and would not require a conformity determination. Reduction in emissions would conform to all SIPs and maintenance plans by definition, and would result in a small net air quality benefit on a regional scale. Overall, ozone is relatively insensitive to minor changes in VOC and NO_x, therefore the minor increase in NO_x and decrease in VOC offset each other in this project. VOC and NO_x are two main components of ozone, and their emissions in the atmosphere undergo reactions in the presence of sunlight to form ground-level ozone regulated under NAAQS for public health protection and general welfare. Because ozone creation is formed from both VOC and NO_x, the rate of ozone production can be VOC- or NO_x-limited depending on geographic characteristics and population concentrations. In rural areas, ozone is NO_x-limited in which increases in NO_x would increase ozone. Urban areas with higher population concentrations are VOC-limited, increases in NO_x would not increase ozone. However, the effect of VOC is somewhat smaller than NO_x in most regions, leading to a very minor overall change in air quality with respect to ozone.

To present these emission changes in context, the emissions were compared with the emissions

²⁷ U.S. EPA, Final Regulatory Impact Analysis for the NO₂ National Ambient Air Quality Standards (NAAQS), January 2010;

projected to occur in each analysis area in 2035 from the on-road sector.^{28, 29} The projected increase in NO_x emissions and decrease in VOC emissions represent less than 0.3 percent of emissions in each area (varies by region and alternative). Changes in all pollutants in the New York Metropolitan Area are projected to be approximately 0.02 percent or less, and changes in CO in the Syracuse area would be less than 0.2 percent. Under Alternative 125, the VOC benefits are somewhat higher, mostly in the Rochester and Buffalo-Niagara Falls analysis areas, and NO_x shows a benefit in those areas but shows a larger increase in the Poughkeepsie area. Changes in particulate matter would be negligible. Overall, in all cases these changes range from very small to negligible.

Alternatives

The total net change in criteria pollutant emissions from Alternative 90B (the Preferred Alternative), are presented in Exhibit G-33 and emissions from Alternatives 90A, 110, and 125 are presented in Exhibit G-34, Exhibit G-35, and Exhibit G-36, respectively. The Preferred Alternative will result in a net reduction of 61 tons per year of CO in the New York-New Jersey-Long Island non-attainment area (for 8-hour ozone) and 44 tons in the Syracuse area, with smaller reductions on VOCs (between 1.8 to 4 tons in the five cities analyzed).

Exhibit G-33—Criteria Pollutant Emissions Net Reduction, 2035, Alternative 90B, Preferred Alternative (tons per year)

Exhibit G-37 identifies the net statewide reduction in MSAT emissions. Since the estimate is based on 2008 data and represents a mix for all locomotive types, this analysis does not capture the benefits

of the Tier 4 locomotives, but also does not capture the benefits of future cleaner light duty gasoline vehicles. U.S. EPA regulations for vehicle engines and fuels will cause overall MSAT emissions to decline significantly over the next several decades in three ways: (1) by lowering the benzene content in gasoline; (2) by reducing exhaust emissions from passenger vehicles operated at cold temperatures; and (3) by reducing emissions that evaporate from, and permeate through, portable fuel containers. In June 2008, the U.S. EPA finalized regulations to reduce emissions from diesel-powered rail. The new regulations would reduce PM emissions by as much as 90 percent and NO_x up to 80 percent. Other federal regulations for both on-road and non-road vehicles are severely reducing diesel emissions, with the expectation for diesel PM and NO_x to diminish over time.

Note that these reductions do not necessarily translate into health or environmental benefits, which would depend on local concentrations at specific locations, rather than statewide emissions. Along roadways, if there would be any noticeable change it would be a reduction, on the order of the local VMT reduction; along rail lines, if there were to be any noticeable change it would not occur along the electrified portion of Alternative 125. A more detailed analysis of local effects may be undertaken during subsequent environmental analysis.

Exhibit G-37—State-Wide Hazardous Air Pollutant Emissions (net reduction tons per year)

Pollutant	Alternative			
	90A	90B	110	125*

Notes: * Net emissions do not include increased electricity consumption. No data is available to describe where electricity would come from and what the HAP emissions would be from each source.				

19. Energy, and Climate Change

The greenhouse gas assessment for the Preferred Alternative is presented in Section 4.20.4 of the Tier 1 Final EIS. The Tier 1 Draft EIS energy and climate change inventory and impact assessments for the other Build Alternatives are presented in the following sections.

19.1 Existing Conditions

19.1.1 Regulatory Context

Greenhouse Gas Policy, Regulations, Standards, and Benchmarks

The energy and GHG analysis was prepared in accordance with the *Draft Air Quality, Energy and Greenhouse Gas Emission Analysis Procedures for Plans and TIPs and Draft Energy and Greenhouse Gas Emission Analysis Procedures for Projects*, February 12, 2003, and subsequent guidance and methods

provided by NYSDOT. In addition to the NYSDOT methodology, the general approach follows the New York State Department of Environmental Conservation (NYSDEC) policy document entitled *Assessing Energy Use and Greenhouse Gas Emissions in Environmental Impact Statements*, July 15, 2009 (NYSDEC policy). The Council on Environmental Quality's (CEQ) final guidance entitled *Final NEPA Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews*, August 1, 2016, was consulted as well.

The global climate is changing as a result of increased concentrations of GHGs in the atmosphere, associated with anthropogenic (from human sources) emissions. GHGs emitted from anthropogenic sources include primarily emissions from combustion of fossil fuels, as well as various other processes. Atmospheric concentrations of GHGs are increasing because the chemical removal processes are limited, and the rate of emission exceeds the rate of the natural removal processes. The increase in GHG concentrations, since the beginning of the industrial age, has led to a measurable warming of the Earth's atmosphere, surface, and oceans, which, in turn, has and will result in myriad of complex climatic changes that will vary by geographic location, substantially affecting human and natural systems.

While the contribution of any single program to climate change is infinitesimal, the combined GHG emissions from all human activity have a severe adverse impact on global climate. The nature of the impact dictates that all sectors address GHG emissions by identifying GHG sources and practicable means to reduce them.

Understanding that human activity resulting in GHG emissions has potential to impact the earth's climate negatively, countries around the world have undertaken efforts to reduce emissions by implementing measures addressing energy consumption and production, land use, and other sectors. Although the U.S. has not ratified the international agreements, which set emissions targets for GHGs, in a step toward the development of national climate change regulation, the U.S. has agreed that deep cuts are necessary and has agreed to take action to meet this objective, with a stated goal of reducing emissions to 17 percent lower than 2005 levels by 2020 and to 83 percent lower than 2005 levels by 2050 (pending legislation) via the Copenhagen Accord.³⁰ Without legislation focused on this goal, the U.S. EPA is required to regulate GHG under the U.S. Clean Air Act, and has already begun preparing regulations. The U.S. EPA has established various voluntary programs to reduce emissions and increase energy efficiency and has recently embarked on regulatory initiatives related to GHG emissions. In 2011, total U.S. greenhouse gas emissions were 6,702.3 teragrams (Tg), or million metric tons, of CO₂e. Total U.S. emissions have increased by 8.4 percent from 1990 to 2011, and emissions decreased from 2010 to 2011 by 1.6 percent (108.0 Tg CO₂e).³¹

In March 2009, the U.S.DOT set combined corporate average fuel economy (CAFE) standards for light duty vehicles for the 2011 model year. In June 2009, the U.S. EPA granted California a previously-denied waiver to regulate vehicular GHG emissions, allowing 19 other states (representing 40 percent of the light-duty vehicle market, including New York) to adopt the California mobile source GHG emissions standards. In April 2010, the U.S. EPA and the U.S. DOT established the first GHG emission standards and more stringent CAFE standards for model year 2012 through 2016 light-duty vehicles. The agencies also proposed the first-ever program to reduce GHG emissions and improve fuel efficiency of medium- and

³⁰ UNFCCC Conference of the Parties, Copenhagen Accord, March 30, 2010; Todd Stern, U.S. Special Envoy for Climate Change, letter to Mr. Yvo de Boer, UNFCCC, January 28, 2010.

³¹ The decrease from 2010 to 2011 was due to a decrease in the carbon intensity of fuels consumed to generate electricity due to a decrease in coal consumption, with increased natural gas consumption and a significant increase in hydropower used. Additionally, relatively mild winter conditions, especially in the South Atlantic Region of the United States where electricity is an important heating fuel, resulted in an overall decrease in electricity demand in most sectors. Since 1990, U.S. emissions have increased at an average annual rate of 0.4 percent.

heavy-duty vehicles, such as large pickup trucks and vans, semi-trucks, and vocational vehicles. These regulations will all serve to reduce vehicular GHG emissions over time.

There are also regional, state, and local efforts to reduce GHG emissions. In 2009, Governor Paterson issued Executive Order No. 24, establishing a goal of reducing GHG emissions in New York by 80 percent, compared to 1990 levels, by 2050, and creating a Climate Action Council tasked with preparing a climate action plan outlining the policies required to attain the GHG reduction goal—that effort is currently under way, and an interim draft plan has been published.³²

The 2009 New York State Energy Plan³³ outlines the state's energy goals and provides strategies and recommendations for meeting those goals. The state's goals include, among other measures, reducing vehicle miles traveled by expanding alternative transportation options.

In July 2019, New York State passed the Climate Leadership and Community Protection Act (Climate Act)³⁴ to adopt measures towards two main goals, to achieve 100 percent zero-emission electricity by 2040 and reduce emissions to at least 85 percent below 1990 levels by 2050. The scoping plan will create enforceable emissions limits to reduce greenhouse gas emissions from oil, gas and diesel combustion based on performance-based standards for emissions and electrification in the transportation sector. Further, scoping will also include land-use and transportation planning aimed at reducing greenhouse gas emissions from motor vehicles.

In January 2021, the new Presidential Administration signed a series of executive orders to promote climate action. One Executive Order proposes the U.S. EPA create a Federal Implementation Plan to control ozone for several states including New York.³⁵ The newly established Working Group will determine and publish interim and final social cost determinations for carbon, nitrous oxide and methane. The social costs will be used to calculate value changes for greenhouse gas emission regulations.

Another Executive Order contained several climate-related goals to build resilience to mitigate the impacts of climate change for current future intensities. The U.S. will pursue efforts that align with the main objectives of the Paris Agreement, clean energy, decarbonization and financial alignment. This executive order established the National Climate Task Force for policy planning and implementation to increase climate change and reduce climate pollution. The Executive Order removes fossil fuel subsidies from the Federal budget, ensures Federal infrastructure investment reduces climate pollution and that Federal permitting considers greenhouse gas emissions and climate change.

Greenhouse Gas Emissions

Potential Impacts of Climate Change

The analysis of impacts of climate change on the proposed program focuses on potential changes in sea level and storm surge particularly as they relate to the Hudson River. Existing scientific studies

³⁵ WhiteHouse.Gov. Presidential Actions. 2021, January 20. *Executive Order on Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis*. <https://www.whitehouse.gov/briefing-room/presidential-actions/2021/01/20/executive-order-protecting-public-health-and-environment-and-restoring-science-to-tackle-climate-crisis/>

and information available from New York State sources were reviewed, and relevant information is presented. Due to the uncertain nature of predictions for future climate change impacts on the Hudson River, a range of possible effects is presented. Although changes in precipitation may occur in future years, affecting flood levels in other areas, the level of detail and certainty regarding those types of effects is currently insufficient for planning purposes.

Extent of Analysis

Since the impact of GHGs emitted in the troposphere is generally the same regardless of where they are emitted, the analysis of GHGs addresses emissions resulting from the proposed program, regardless of their location. Direct emissions include emissions from sources located on-site, such as construction equipment during the construction period and locomotive emissions during long-term operation of the program. Indirect emissions include emissions from, vehicle trips associated with the program (both increased and reduced) and emissions associated with electricity consumption. In addition, there are emissions preceding and following the proposed program, referred to as upstream and downstream emissions, such as emissions associated with the transport and production of fuels and construction materials, and emissions associated with disposal of materials after their use. The GHG analysis addresses both direct and indirect emissions, and, where practicable and significant, upstream and downstream emissions as well, including fuel and materials production.

Pollutants of Concern

GHGs are those gaseous constituents of the atmosphere, both natural and anthropogenic, that absorb and emit infrared radiation (heat) emitted by the Earth's surface, the atmosphere, and clouds. This property causes the general warming of the Earth's atmosphere, or the "greenhouse effect." Water vapor, carbon dioxide (CO₂), nitrous oxide, methane, and ozone are the primary greenhouse gases in the Earth's atmosphere.

There are also a number of entirely human-made GHGs—mainly halocarbons and other chlorine- and bromine-containing substances—which also damage the stratospheric ozone layer (contributing to the "ozone hole"). Since these compounds are being replaced and phased out due to the 1987 Montreal Protocol and are not associated with most projects, there is generally no need to address them in program-related GHG assessments. Although ozone is considered to be the third most important greenhouse gas, after CO₂ and methane, it does not need to be assessed as such at the program level since it is a rapidly-reacting chemical and efforts are ongoing to reduce ozone concentrations as a criteria pollutant (see Section 4.19, "Air Quality"). Similarly, water vapor is of great importance to global climate change, but is not directly of concern as an emitted GHG since the negligible quantities emitted from anthropogenic sources are not of concern.

Carbon dioxide (CO₂) is the primary pollutant of concern from anthropogenic sources. Although not the GHG with the strongest effect per molecule, CO₂ is by far the most abundant and, therefore, the most influential GHG. CO₂ is emitted from any combustion process (both natural and anthropogenic), from some industrial processes such as the manufacture of cement, mineral production, metal production, and the use of petroleum-based products, from volcanic eruptions, and from the decay of organic matter. CO₂ is removed ("sequestered") from the lower atmosphere by natural processes such as photosynthesis and uptake by the oceans.

Methane and nitrous oxide (N₂O) also play an important role since they have limited removal processes and a relatively high impact on global climate change as compared to an equal quantity of

CO₂. Emissions of these compounds, therefore, are included in GHG emissions analyses as appropriate.

The NYSDEC and CEQ guidance list six GHGs that could potentially be included in the scope of an EIS: CO₂, N₂O, methane, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆). This analysis focuses mostly on CO₂, N₂O, and methane resulting from combustion sources such as locomotives and vehicles, as well as sources associated with production of construction materials. There are no significant direct or indirect sources of HFCs, PFCs, or SF₆ associated with the proposed program.

To present a complete inventory of all GHGs, component emissions are added together and presented as CO₂ equivalent (CO₂e)—a unit representing the quantity of each GHG weighted by its effectiveness using CO₂ as a reference. This is achieved by multiplying the quantity of each GHG emitted by a factor called global warming potential (GWP). GWPs account for the lifetime and the radiative forcing of each chemical over a period of 100 years (e.g., CO₂ has a much shorter atmospheric lifetime than SF₆, and therefore has a much lower GWP). The GWPs for the main GHGs discussed here are presented in Exhibit G-38.

Exhibit G-38—Global Warming Potential (GWP) for Major GHGs

Greenhouse Gas	100-year Horizon GWP
Carbon Dioxide (CO ₂)	1
Methane (CH ₄)	25
Nitrous Oxide (N ₂ O)	298
Hydrofluorocarbons (HFCs)	124 to 14,800
Perfluorocarbons (PFCs)	7,390 to 12,200
Sulfur Hexafluoride (SF ₆)	22,800

19.1.2 Methodology

This section describes the parameters used for the GHG assessment and describes the methodology used to calculate the GHG emissions from each included source.

Time Scales for Analysis

Operational emissions are presented for a single year, 2035, which would be representative of a reasonable worst-case scenario. Operational emissions may be lower in more distant years if the carbon content of fuels improve (or is replaced by electric power) and later if locomotives are replaced with more efficient models or rebuilt; the reduction in vehicular emissions may also be reduced in far-future years as vehicular emissions and fuels also improve. Emissions related to construction activity and embodied materials would occur over a period prior to and during

construction, and are presented both as total emissions and annualized over an estimated 80-year lifetime of the proposed program.

Emission Calculations

Section 4.20 of the Tier 1 Final EIS provide a summary of the GHG assessment and the operational emissions included in the impact assessment (locomotive and on-road fuel consumption, energy use (rail only), fuel use for construction material delivery, and building materials production). These calculations are described further below.

A minimal change in the amount of solid waste would be generated as a result of the proposed program. Therefore, emissions from solid waste decomposition were not included.

Generally, the elimination of vegetation on a site would accelerate the release of CO₂ sequestered in any vegetation found on the site back to the atmosphere. This would mostly be relevant only for the 125 mph alternative, where a new alignment is expected. For other alternatives, it is unknown at this time if any tree removal would be required. However, detailed information on this is not available at this time, and therefore sequestration has not been included in this analysis.

Locomotive and On-Road Fuel Consumption

Emissions associated with the locomotive operations and on-road vehicle trips were calculated using the methods in NYSDOT's MOVES Roadway and Rail Energy and Greenhouse Gas Analysis Extension (MOVES-RREGGAE). This program enables analysis of rail operations and on-road trips, using EPA's MOVES-HVI model for on-road emissions and the analysis procedures in NYSDOT's *Draft Energy Analysis Guidelines for Project-Level Analysis*, November 25, 2003 (NYSDOT guidance).

The locomotive emissions were refined outside of the model to account for the fact that operation on the line is not represented by the national averages used in MOVES-RREGGAE for Amtrak service, and since more detailed data was available. Fuel consumption was estimated using LTK Engineering Services' TrainOps simulation model. The model includes proposed grades, curves, station locations, speed restrictions and switch-related diverging movements specific to the proposed program alternatives. Locomotive emissions were calculated by multiplying the fuel consumption by emission and energy factors for diesel fuel, assuming 10.15 kilograms of CO₂ per gallon of diesel and 138,756 British thermal units (Btu) per gallon of diesel.³⁶ These were adjusted to account for well-to-pump emissions by the same ratio used for all diesel, consistent with the method used throughout the analysis.

Electricity Use

Analysts estimated electricity consumption for the electrified portion of the line (Albany to Buffalo) under the 125 Alternative using the TrainOps simulation model. The electricity consumption was estimated to be 258,198 kilowatt-hours per day, and would be constant throughout the year. This includes system losses within the Amtrak system, but does not include any incremental electricity use for facilities or stations, which is unknown at this time.

³⁶ EIA, Fuel Emission Coefficients, Table 2: Carbon Dioxide Emission Factors for Transportation Fuels, <<http://205.254.135.7/oiaf/1605/coefficients.html#tbl2>>, updated January 31, 2011.

GHG emissions associated with the electricity were estimated based on the above consumption rate and a factor of 686.7 pounds CO₂e per megawatt-hour of electricity delivered.³⁷ This represents the latest intensity of electricity production for upstate New York. The emissions intensity of future electricity production is expected to be lower due to various current and future policies aimed at increasing the production of electricity from renewable resources and improved energy efficiency in the utility sector. Therefore, this estimate represents a conservatively high estimate of emissions associated with the operation of electric locomotives.

Construction and Materials

Analysts used the procedures in MOVES-RREGGAE for rail construction to calculate estimated GHG emissions associated with direct construction emissions. In addition, analysts used the “Roadway Construction,” module for roadway construction segments associated with the construction, and for elements such as bridge construction not included in the “Railway Construction” module. Analysts calculated emissions associated with materials as part of the analysis (the methodology for estimating “placement energy” is based on energy estimated for materials, as detailed in the NYSDOT guidance—both were included here).

Summary of Emissions Analysis

Operational emissions are presented for a single year, 2035, which would be representative of a reasonable worst-case scenario. Emissions related to construction activity and embodied materials would occur over a period prior to and during construction, and are presented both as total emissions and annualized over an estimated 80-year lifetime of the proposed program.

The GHG emissions analysis includes the following sources:

- Locomotives fuel consumption,
- On-road fuel consumption,
- Electricity use (rail only),
- Fuel use for construction material delivery, and
- Building materials production.

Some additional emissions associated with stations and other operations would occur, but are not included at this time since detailed data is not yet available.

Annual emissions that would occur as a result of program operation were conservatively calculated based on the 2035 ridership scenario, representing the maximum emissions associated with the proposed program at full operation. This section describes the methodology used to calculate the GHG emissions from each included source.

19.2 Environmental Consequences

19.2.1 Greenhouse Gas Emissions for Program Alternatives

The long-term impact of the Build Alternatives on energy and greenhouse gas emissions is ultimately always positive, as the on-road benefits persist year after year and eventually offset the initial construction impacts (see Exhibit G-39, Exhibit G-40, and Exhibit G-41). As discussed in Section 4.20

³⁷ U.S. EPA, eGRID1010 Version 1.1, Year 2007 Summary Tables, <<http://www.epa.gov/cleanenergy/energy-resources/egrid>>.

of the Tier 1 Final EIS, the Preferred Alternative would result in an annual reduction of energy use (of approximately 391,000 million BTu) and greenhouse gas emissions (approximately 33,000 metric tons of CO₂ equivalent [CO₂e]) over the Base Alternative. This reduction in energy use and GHG emissions would be 20 percent greater than Alternative 90A and roughly equivalent to that for Alternative 110 (2% less). Compared to the Preferred Alternative, Alternative 125 has the greatest potential for decrease in annual energy use (44%) and GHG emissions (by 30%).

For the non-electric alternatives, rail energy and emissions slightly increase from Alternative 90A to Alternative 90B (the Preferred Alternative) to Alternative 110. Alternative 125 would have substantially more rail energy and emissions associated with added train trips, including both diesel and indirect electricity emissions. The benefits from removing vehicle trips from the road trend in the opposite direction with ridership and the ensuing energy and emissions benefits increase from Alternative 90A to Alternative 90B (the Preferred Alternative) to Alternative 110, and are substantially higher for Alternative 125.

However, Alternative 125 is likely to require the greatest quantity of energy and materials for construction. Thus, it has the greatest potential to adversely affect net energy and greenhouse gases (accounting for the difference between energy and GHG emissions from construction and from permanently reduced annual on-road energy use and emissions as auto and bus riders switch to more energy-efficient and less polluting rail). Other alternatives have lesser adverse initial energy and emissions impacts in proportion to their lesser construction emissions impacts. Alternative 90A would demonstrate a potential beneficial impact starting approximately 20 to 23 years after construction as the permanent emissions reduction due to auto/bus diversions to rail continues and eventually exceeds (in total over many years) the emissions increases recorded during construction.

As discussed in Section 4.20 of the Tier 1 Final EIS, Alternative 90B would have a potential beneficial impact starting approximately 47 to 50 years after construction, with Alternatives 110 and 125 demonstrating net positive energy and emissions impacts still further into the future, 78 to 92 years and 303 to 317 years, respectively.

Exhibit G-39—Net Energy Use and GHG Emissions as Compared with Base Alternative, Alternative 90A

	Energy Use (million Btu)	GHG Emissions (metric tons CO ₂ e)
Rail Operation (per year)	335,567	24,641
Rail Maintenance (per year)	47,827	3,501
On-Road Maintenance (per year)	-22,348	-1,636
On-Road Operation (per year)	-684,691	-54,230

Construction (total)	7,496,478	548,762
Offset Period (years)	23	20
Notes: Negative numbers indicate reduction as compared to Base Alternative. Includes well-to-pump emissions for both on-road and rail components.		

Exhibit G-40—Net Energy Use and GHG Emissions as Compared with Base Alternative, Alternative 110

	Energy Use (million Btu)	GHG Emissions (metric tons CO ₂ e)
Rail Operation (per year)	404,035	29,669
Rail Maintenance (per year)	47,827	3,501
On-Road Maintenance (per year)	-26,962	-1,974
On-Road Operation (per year)	-823,256	-65,204
<i>Net (per year)</i>	-398,355	-34,008
Construction (total)	36,468,799	2,669,614
Offset Period (years)	92	78
Notes: Negative numbers indicate reduction as compared to Base Alternative. Includes well-to-pump emissions for both on-road and rail components.		

Exhibit G-41—Net Energy Use and GHG Emissions as Compared with Base Alternative, Alternative 125

	Energy Use (million Btu)	GHG Emissions (metric tons CO ₂ e)
Rail Operation (per year)	635,672	52,398
Rail Maintenance (per year)	133,071	9,741
On-Road Maintenance (per year)	-42,464	-3,109
On-Road Operation (per year)	-1,290,655	-102,221
<i>Net (per year)</i>	-564,376	-43,191
Construction (total)	178,996,609	13,103,131
Offset Period (years)	317	303
Notes: Negative numbers indicate reduction as compared to Base Alternative. Includes well-to-pump emissions for both on-road and rail components.		

19.2.2 Preferred Alternative

The long-term impact of the Preferred Alternative (Alternative 90B) on energy and greenhouse gas emissions is ultimately always positive, as the on-road benefits persist year after year and eventually offset the initial construction impacts (see Exhibit 4-27). Alternative 90B would result in an annual reduction of energy use (of approximately 391,000 million BTu) and greenhouse gas emissions (approximately 33,000 metric tons of CO₂ equivalent [CO₂e]) over the Base Alternative. The net annual operational benefits for the Preferred Alternative would total approximately 391 billion Btu per year and 28,000 to 33,000 metric tons CO₂e per year. This is roughly equivalent to eliminating the emissions associated with the energy and electricity consumption of 2,500 to 4,200 average U.S.

single family homes every year.³⁸

Alternative 90B would have a potential beneficial impact starting approximately 47 to 50 years after construction. Note that the method for estimating the construction emissions has a large level of uncertainty associated with it, and the Congressional Budget Office has suggested that this method substantially overestimates the impact of construction.³⁹ If, for example, this conservative estimate is overestimated by a factor of five, the time required to offset construction emissions could range from 4 to 60 years, which may be considered a reasonable payback period.

19.2.3 Discussion

Potential Impacts of Climate Change

The analysis of impacts of climate change on the program focuses on potential changes in sea level in the context of flooding. Existing scientific studies and information available from New York City and State sources were reviewed, and relevant information is presented. Due to the uncertain nature of predictions for future climate change impacts, a range of possible effects is presented. While future changes in other climate parameters such as temperature, storm frequency, and precipitation may have some effect on rail operations, the projections for these parameters are much less certain at this time and are therefore not addressed here.

In 2016, DEC established sea-level rise projections for three specified geographic regions over various time intervals as part of Part 490 in Environmental Conservation Law⁴⁰, recently added in 2014 by New York State's Community Risk and Resiliency Act. In the lower Hudson Valley, sea levels are likely to increase by 15 to 75 inches by the end of the century, and in the Mid-Hudson Valley, sea levels are likely to increase by 11 to 71 inches by the end of the century. In general, the probability of sea levels increasing is characterized as "extremely likely." Intense hurricanes are characterized as 'more likely than not' to increase in intensity and/or frequency, and the likelihood of changes in other large storms ("Nor'easters") are characterized as unknown. Therefore, the projections for future 1-in-100 coastal storm surge levels for the area include only sea level rise at this time and do not account for changes in storm frequency.

Note that in light of more recent scientific analyses, as reported by the Intergovernmental Panel on Climate Change (IPCC) and as reviewed by the New York City Panel on Climate Change (NPCC), it is reasonable to assume that sea level and floodplains would rise by up to 2.0 feet by the end of the century, with a chance of increases up to 4.5 feet at the upper estimate of the middle range scenario. The best available data would be reviewed when planning to specific elevations occurs.

Most of the rail line from New York City to Albany runs along the eastern shore of the Hudson Estuary, much of that within current floodplains or immediately adjacent to the 1-in-100 floodplain (the area with a flooding probability of 1-in-100 in any given year). Some of these areas are already vulnerable to flooding in the current condition, and by the end of the century, all areas along the shore would be within the floodplain.

³⁹ U.S. Congress—Congressional Budget Office, Urban Transportation and Energy: The Potential Savings of Different Modes, December 1977.

⁴⁰ New York State Department of Environmental Conservation. *Part 490, Projected Sea-level Rise*.
<https://www.dec.ny.gov/regulations/119069.html>

The current program does not propose rebuilding this existing rail line, but rather adjusting and upgrading various small sections along the existing line, and therefore, cannot accomplish major changes such as raising the elevation of the track or relocating track to areas outside of the future floodplain. However, NYSDOT will coordinate with state and federal agencies regarding potential actions for adapting to future climate conditions in order to avoid repeated construction work. Potential mitigation strategies to address sea level rise/flooding are addressed under Section 4.20.5 of the Tier 1 Final EIS.

For the non-electric alternatives, rail energy and emissions slightly increase from Alternative 90A to Alternative 90B (the Preferred Alternative) to Alternative 110 due to the slight increase in train trips and the increased acceleration and deceleration for the 110 Alternative in locations where the track is not capable of supporting the 110-miles per hour speed. Alternative 125 would have substantially more rail energy and emissions associated with added train trips, including both diesel and indirect electricity emissions.

The benefits from removing vehicle trips from the road trend in the opposite direction with ridership and the ensuing energy and emissions benefits increase from Alternative 90A to Alternative 90B (the Preferred Alternative) to Alternative 110, and are substantially higher for Alternative 125. The net annual operational benefits range from approximately 323 to nearly 564 billion Btu per year and 28,000 to 43,000 metric tons CO₂e per year. This is roughly equivalent to eliminating the emissions associated with the energy and electricity consumption of 2,500 to 4,200 average U.S. single family homes every year.⁴¹

The total potential annual operational emissions savings, the initial investment of energy and associated emissions from construction activity and the production and delivery of materials used for construction, and the net energy and emissions payback period are presented in Exhibit G-39 through Exhibit G-41, above. Alternative 90A has the smallest annual benefit but would also require the shortest period to offset the emissions, 20 years, while Alternative 125 with the largest annual benefit would require the longest period to offset those emissions—317 years.

The differences between the alternatives are mostly based on the construction emissions since the ridership differences are comparatively small. Given the potential for other future changes aimed at reducing the footprint of energy use such as renewable electricity and fuels, it is unlikely that the construction emissions from Alternative 90B (the Preferred Alternative) or Alternatives 110, or 125 would ever actually be offset, given potential future changes in on-road technology. Regardless, from a global climate perspective, if it did require 50 years or more to payback the emissions, no real benefit would be shown this century, which is the main focus of current climate analyses.

Note that the method for estimating the construction emissions has a large level of uncertainty associated with it, and the Congressional Budget Office has suggested that this method substantially overestimates the impact of construction.⁴² If, for example, this conservative estimate is overestimated by a factor of five, the time required to offset construction emissions could range from 4 to 60 years, which may be considered a reasonable payback period.

20. Contaminated and Hazardous Material

20.1 Existing Conditions

20.1.1 Empire Corridor South

All of the Build Alternatives follow the existing Empire Corridor South for the majority of its length, deviating only in Rensselaer County, where Alternative 125 splits off 1.6 miles south of where the existing Empire Corridor turns to the west. The 90/110 Study Area has a total of 4,140 sites, of which 3,748 are in Manhattan (New York County). The 125 Study Area has a total of 4,135 sites, of which the same 3,748 are in Manhattan (New York County). The major feature along the Empire Corridor South is the Hudson River.

The Hudson River PCBs (polychlorinated biphenyl) Superfund Site is located in all of the counties along the 142-mile Empire Corridor South. This site encompasses a nearly 200-mile stretch of the Hudson River extending from Hudson Falls to Battery Park in New York City.⁴³ From approximately 1947 to 1977, General Electric Company (GE) discharged as much as 1.3 million pounds of PCBs from its capacitor manufacturing plants at the Hudson Falls and Fort Edward facilities into the Hudson River. As a result, the primary health risk associated with the site is the accumulation of PCBs in the human body through eating contaminated fish. PCBs are considered probable human carcinogens and are linked to other adverse health effects such as low birth weight, thyroid disease, and learning, memory, and immune system disorders. PCBs in the river sediment also affect fish and wildlife.

In February 2002, the U.S. EPA issued a Record of Decision (ROD) for the Hudson River PCBs Superfund Site that calls for targeted environmental dredging of approximately 2.65 million cubic yards of PCB-contaminated sediment from a 40-mile section of the Upper Hudson River extending north of Troy, upstream of the study area. The cleanup will occur in two phases. Phase 1 of the project was conducted by GE with oversight by the U.S. EPA from May to November 2009. During this phase, approximately 283,000 cubic yards of PCB-contaminated sediment was removed from a six-mile stretch of the Upper Hudson River near Fort Edward, New York. In the study area, removal of PCB and lead in contaminated soils was also performed on Rogers Island in Columbia County. The U.S. EPA determined it was necessary to remove contaminated soils on the north side of the island. Phase 2 will remove the remainder of the contaminated river sediment targeted for dredging and it will take five to seven years to complete.

Exhibit G-42 summarizes the contaminated and hazardous materials sites within the Empire Corridor. **New York County** has the most contaminated and hazardous material sites of any county in the Empire Corridor South Segment. The majority of these, 3,667, are Petroleum Bulk Storage (PBS) sites. In addition, there are 64 RCRA sites, six TRIS sites and 11 Chemical Bulk Storage (CBS) sites.

Bronx County has a total of 116 sites, mostly PBS (115) and RCRA (one).

Westchester County has 52 contaminated and hazardous material sites with 16 RCRA sites, 15 TRIS sites, 12 CBS sites, five MOSF sites, three PBS sites and one Superfund site. The majority of these sites are located near the cities of Yonkers, Tarrytown, Ossining and Peekskill.

Putnam County has the fewest contaminated and hazardous material sites in Empire Corridor South with 12 PBS sites, one NPL and one Superfund site. The majority of these sites are located in the town of Cold Spring.

Dutchess County has 106 contaminated and hazardous material sites, the majority of which are located in the city of Beacon, Crown Heights and in/around the city of Poughkeepsie. There are 87 PBS sites, five RCRA sites, five TRIS and CBS sites, three MOSF sites and one Superfund site.

Columbia County has 13 contaminated and hazardous material sites with 11 PBS sites and two TRIS sites. The majority of these sites are located in the city of Hudson.

In **Rensselaer County** the 90/110 Study Area has 91 contaminated and hazardous material sites with 51 PBS sites, nine RCRA sites, 10 TRIS and CBS sites, nine MOSF sites and two Superfund sites. The 125 Study Area has 86 contaminated and hazardous material sites with 47 PBS sites, nine RCRA sites, 10 TRIS and CBS sites, eight MOSF sites and two Superfund sites. The majority of these are located in the city of Rensselaer.

20.1.2 Empire Corridor West/Niagara Branch: 90/110 Study Area

The Empire Corridor West/Niagara Branch 90/110 Study Area has a total of 2,271 sites, less than the Empire Corridor South. The majority are located in the more urbanized counties in: Erie County (447 sites), Monroe County (373 sites), Oneida County (281 sites), and Onondaga County (238 sites).

Albany County has 188 contaminated and hazardous material sites, the majority of which are located in the city of Albany. There are 155 PBS sites, 13 RCRA sites, nine TRIS and CBS Sites, one NPL and one Superfund site.

Schenectady County has 114 contaminated and hazardous material sites with 106 PBS sites, one RCRA site, three TRIS sites, two CBS and two MOSF sites. The majority of these sites are located in and around the city of Schenectady.

Montgomery County has 139 contaminated and hazardous material sites with 119 PBS sites, 10 RCRA sites, five CBS sites, four TRIS sites and one Superfund site. The sites are generally located in the larger cities/towns such as the city of Amsterdam, Fonda, the town of Canajoharie, Fort Plain and the town of St. Johnsville.

Herkimer County has 127 contaminated and hazardous material sites, mostly located in the city of Little Falls and Ilion. There are 110 PBS sites, seven RCRA sites, six TRIS sites and four CBS sites.

Oneida County has 281 contaminated and hazardous material sites with 244 PBS sites, 11 RCRA sites, 12 TRIS sites, eight CBS sites, three Superfund sites, two MOSF sites and one NPL site. The majority of these sites are located in and around the city of Utica and the city of Rome.

Madison County has 18 contaminated and hazardous material sites with 12 PBS sites, four CBS sites and two TRIS sites. The majority of these sites are located in the city of Oneida and the village of Canastota.

Onondaga County has 238 contaminated and hazardous material sites, the majority of which are located in and around the city of Syracuse. There are 178 PBS sites, 17 RCRA sites, 23 TRIS sites, 17 CBS sites, two Superfund sites and one MOSF site.

Cayuga County has 11 contaminated and hazardous material sites, the fewest in the Empire Corridor West/Niagara Branch segment including one RCRA site, nine PBS sites and one CBS site. The majority of these sites are located in the village of Weedsport.

Wayne County has 80 contaminated and hazardous material sites, the majority of which are located in the town of Savannah, village of Clyde, village of Lyons and the town of Palmyra. There are 59 PBS sites, seven RCRA sites, eight TRIS sites, five CBS sites and one MOSF site.

Monroe County has 373 contaminated and hazardous material sites with 41 RCRA sites, 265 PBS sites, 43 TRIS sites, 17 CBS sites, six Superfund sites and one MOSF site. The majority of these sites are located in and around the city of Rochester.

Genesee County has 164 contaminated and hazardous material sites with 148 PBS sites, two RCRA sites, eight CBS sites and six TRIS sites. The majority of these sites are located in the town of Bergen and the city of Batavia.

Erie County has 447 contaminated and hazardous material sites, the most in the Empire Corridor West/Niagara Branch segment. The majority of these sites are located in the city of Buffalo and the city of Tonawanda. There are 35 RCRA sites, 334 PBS sites, 54 TRIS sites, 13 CBS sites, 10 Superfund sites and one MOSF site.

Niagara County has 91 contaminated and hazardous material sites in the Empire Corridor West/Niagara Branch segment with eight RCRA sites, 56 PBS sites, seven CBS sites, 12 TRIS sites, five Superfund sites, two NPL sites and one MOSF site. The majority of these sites are located in the city of North Tonawanda and the city of Niagara Falls.

20.1.3 Empire Corridor West/Niagara Branch: 125 Study Area

The 125 Study Area follows a more direct route between Rensselaer and Buffalo, which bypasses several of the major metropolitan areas and stations sites (Schenectady, Amsterdam, Utica, and Rome). The Empire Corridor West/Niagara Branch 125 Study Area has a total of 1,347 sites. The majority are located in the more urbanized counties in: Erie County (435 sites), Monroe County (365 sites), and Onondaga County (239 sites).

Albany County has 68 contaminated and hazardous material sites, the majority of which are located in the city of Albany. There are 51 PBS sites, 10 RCRA, two TRIS, four CBS, one MOSF site.

Schenectady County has 36 contaminated and hazardous material sites with 34 PBS sites and two TRIS sites. The majority of these sites are located in and around the city of Rotterdam.

Schoharie, Montgomery and Herkimer counties have very few contaminated and hazardous material sites. There is a single PBS site in the study area within **Schoharie County** and only three total sites in **Montgomery County**: two TRIS sites and one PBS site. The study area within **Herkimer County** has a total of four contaminated and hazardous materials sites: three PBS and one CBS site. The corridor passes through primarily rural land in these three counties, which likely accounts for the low number of contaminated and hazardous materials sites.

Oneida and Madison counties both have 29 contaminated and hazardous material sites. In **Oneida County**, there are 20 PBS sites, three RCRA, two TRIS, two CBS, and two Superfund sites. The majority of these sites are located in and around the towns of Clinton and Sherrill. In **Madison County**, there are 23 PBS sites, three TRIS and three CBS sites. The majority of these sites are located in and around the cities of Oneida and Canastota.

Onondaga County has 239 contaminated and hazardous material sites, the majority of which are located in and around the city of Syracuse. There are 180 PBS sites, 17 RCRA, 22 TRIS, 17 CBS, two Superfund sites and one MOSF site.

Cayuga County only has a single contaminated and hazardous material site, a PBS site. Along with Schoharie County, this has the fewest sites in the Empire Corridor West/Niagara Branch 125 Study Area.

Wayne County has 25 contaminated and hazardous material sites scattered along the corridor. There are 23 PBS sites, one TRIS and one Superfund site.

Monroe County has 365 contaminated and hazardous material sites with 38 RCRA sites, 262 PBS sites, 42 TRIS sites, 16 CBS sites, six Superfund sites and one MOSF site. The majority of these sites are located in and around the city of Rochester.

Genesee County has 21 contaminated and hazardous material sites scattered along the corridor, all of which are PBS sites.

Erie County has 435 contaminated and hazardous material sites, the most in the Empire Corridor West/Niagara Branch 125 Study Area, the majority of which are located in the city of Buffalo and the city of Tonawanda. There are 35 RCRA sites, 322 PBS, 53 TRIS, 14 CBS, 10 Superfund sites and one MOSF site.

Niagara County has 91 contaminated and hazardous material sites in the Empire Corridor West/Niagara Branch segment with eight RCRA sites, 56 PBS sites, seven CBS sites, 12 TRIS sites, five Superfund sites, two NPL sites and one MOSF site. The majority of these sites are located the city of North Tonawanda and the city of Niagara Falls.

20.2 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered (refer to Section 4.22). The potential effects of the Base Alternative and the other Build Alternatives are described in more detail below.

20.2.1 Base Alternative

The Base Alternative represents the baseline condition against which the alternatives are measured and incorporates improvements that have already been programmed and have been constructed. The Tier 1 Draft EIS addressed the potential impacts of the eight projects included in the Base Alternative. The Base Alternative will maintain weekday service frequencies. Because proposed work with this alternative was anticipated to be located entirely within the right-of-way, no land acquisitions were anticipated, minimizing the potential for liability since NYSDOT would not have acquired additional property. In general, signal and grade crossing work would have a low potential for encountering contaminated materials. The track improvements were to be completed within the existing right-of-way. However, any subsurface work activities (e.g. excavation, trenching etc.) would have the potential to encounter contaminated materials that could require special handling and disposal requirements.

20.2.2 Alternative 90A

NYSDOT anticipates that work will be contained within the right-of-way, and thus no land acquisitions are expected; therefore, impacts would be similar to those described in the Base Alternative with the potential for encountering contaminated materials increasing with subsurface work.

In addition, Alternative 90A would include replacement of the Livingston Avenue Bridge, which extends over the Hudson River between the urbanized cities of Rensselaer and Albany (Rensselaer and Albany counties, respectively). The replacement of the bridge would include extensive subsurface activities (i.e. installation of footings and piers) and therefore the potential to encounter contaminated soils and groundwater would be high. In addition, given the presence of the Hudson River polychlorinated biphenyl (PCB) site, there would be a higher likelihood that PCB-impacted sediment and surface water will be encountered during bridge construction activities.

20.2.3 Alternative 110

Similar to the Alternative 90B, the majority of work for Alternative 110 would be completed within the existing right-of-way. There would be 18 locations where new right-of-way would need to be acquired (MPs 168.3, 184.6, 186.3, 191.7, 198.1, 200.6, 207.5, 210.8, 215.1, 226.9, 228.0, 230.8, 237.2, 286.4, 341.1, 361.4, 377.7 and 389.1). As with Alternative 90B, the acquisition of property would include a potential liability for NYSDOT if the properties currently or historically used, stored or disposed of hazardous materials or petroleum products. Property acquisition would also include the acquisition of two current structures, which would require asbestos, lead and hazardous material surveys prior to demolition activities.

Two grade separated flyovers would be located at MPs 279 and 366. As with Alternative 90B, the flyover at MP 279 would be located in a more rural area, and no mapped hazardous materials facilities are in the vicinity of the alignment. The flyover at MP 366 is located in the more urban area of Rochester, and there would be mapped PBS facilities located in the vicinity of the improvements. These structures would have a higher likelihood to encounter contaminated soil and groundwater as a result of caisson and abutment construction.

As with Alternative 90B, Alternative 110 would also include station improvements at the Schenectady, Amsterdam, Utica, Rome, Syracuse, Rochester and Buffalo-Depew stations. Station improvements may entail a greater potential for subsurface excavations that could encounter contaminated soils and groundwater.

20.2.4 Alternative 125

Construction of new track and alignment would have the potential to encounter contaminated soils and/or groundwater since subsurface work would be more likely for this new alignment than for additional track within the existing railroad right-of-way. Alternative 125 would generally parallel the New York State Thruway through the cities of Albany and Schenectady. After leaving the City of Schenectady, the alignment would generally cross rural lands, with the exception of urban sections of Syracuse, Rochester, and Buffalo, where the 125 alignment rejoins to extend alongside the Empire Corridor. Mapped hazardous materials facilities would be located sporadically in the vicinity of the new alignment throughout the rural land, with more densely mapped hazardous materials facilities located in Albany and Schenectady.

Through the cities of Syracuse and Rochester, Alternative 125 would be within the existing Empire Corridor right-of-way; however, there would be numerous mapped hazardous materials facilities adjacent to the alignment in Syracuse, and there would be potential to encounter contaminated materials with the construction of new track depending on requirements for subsurface activities.

Since Alternative 125 would involve 236 miles of construction of new right-of-way, there would be numerous property acquisitions for the alignment. The acquisition of property would include a potential liability for NYSDOT if the properties currently or historically use, store or dispose of hazardous materials or petroleum products. In addition, property acquisition would also include the acquisition of numerous structures, which would require asbestos, lead and hazardous material surveys prior to demolition activities.

21. Indirect and Cumulative Impacts

Indirect and cumulative impacts include reasonably foreseeable actions and proposed and planned actions, both by NYSDOT and by other agencies. This Tier 1 evaluation presents a generalized assessment of these impacts based on Tier 1 concepts that would be further refined in the Tier 2, once the scope and timing of improvement projects are better defined.

Section 4.24 examines the indirect and cumulative impacts of the Preferred Alternative. This section presents the context for the evaluations and the indirect and cumulative impacts of the other alternatives considered.

21.1 Methodology

For the Tier 1 analysis, the indirect impacts were qualitatively addressed for the program on a generalized basis. This cumulative impact assessment involved researching projects listed on New York State Rail Plan, the NYSDOT *Statewide Transportation Improvement Program for Federal Fiscal Years 2020 – 2023* for the different planning regions in the study area, as well as *Amtrak's Northeast Corridor Capital Investment Plan Fiscal Years 2020-2024*. Some of the projects listed in the vicinity of the study area and are in the planning phases but are projected to be built in the same timeframe as the Tier 2 program.

21.2 Considerations for Impact Assessment

21.2.1 Indirect Impacts

- **Traffic and Transportation:** Increased traffic can occur if the program induces secondary development.
- **Land Use:** Changes in land uses or land use patterns can arise if secondary development occurs as a result of the program, potentially causing an increase in property values or the intensity or patterns of land use development.
- **Employment, Population, and Businesses:** Indirect impacts resulting from improvements in passenger rail service have the potential to affect changes in socioeconomic conditions, such as employment and population, and can positively affect business sales and revenues.

- **Environmental Justice and Community Facilities:** Secondary development, or development induced by mobility and access improvements, has the potential to affect communities and environmental justice populations through changes in development patterns, traffic, or property values.
- **Coastal/Water Resources and Floodplains:** Secondary development can result in direct or indirect effects on surface waters, aquifers, floodplains, and wetlands.
- **Ecology and SEQR Critical Areas:** Secondary development has the potential to directly or indirectly affect aquatic and wildlife habitats and critical areas protected under SEQR.
- **Cultural Resources, Parks, Visual Resources:** Secondary development may have the potential to affect historic or archaeological sites, parks, or scenic landscapes, although any impacts are likely to require mitigation, including potential provision of historic mitigation and additional parklands or other amenities.
- **Farmlands:** Secondary development has the potential to affect actively farmed lands and prime farmland soils or soils of statewide importance.
- **Air Quality, Noise, Energy/Climate Change:** Increased traffic from secondary development has the potential to increase noise and emissions of air pollutants, which can affect energy use and climate change.
- **Contaminated and Hazardous Materials:** Secondary development has the potential to affect either existing contaminated or hazardous materials sites or the generation of contaminated/hazardous materials.

21.2.2 Cumulative Impacts

A review of the New York State Department of Transportation Improvement Program was performed to identify projects in the vicinity of the Empire Corridor that may involve capacity improvements (see Exhibit G-43). The projects identified included the following:

- Moynihan Station Redevelopment/Improvements, Manhattan (New York County), New York City;
- Penn Station Access Improvements, New York City;
- Amtrak's Gateway Project for Expanded Trans Hudson Heavy/Commuter Rail Capacity;
- Route 17 Upgrade to I-86: Exit 130A to 131;
- New Highway Construction, John B. Daly Boulevard Extension from Niagara Street to Pine Avenue, City of Niagara Falls (Niagara County).

Exhibit G-43—Projects in the Vicinity of the Empire Corridor

Other Transportation Projects and Location	Project Description	Implementation
Moynihan Station Redevelopment/Improvements Manhattan, New York County – Pennsylvania Station	Phase 1: <ul style="list-style-type: none"> Two new entrances through the Farley building Extension of the West End Concourse to serve 8 additional tracks Doubling of concourse width New stairs, escalators, and elevators from the platforms up to the station to meet ADA requirements Contracted Phase 1 at \$147.75 million Future Work <ul style="list-style-type: none"> When completed, the \$2.5 billion program includes this redevelopment in the main building and its annex, as well as renovation of the 7th and 8th Avenue subway stations. 	Phase 1: <ul style="list-style-type: none"> Began October 2012-completed
Penn Station Access Improvements	<ul style="list-style-type: none"> Enhanced pedestrian flows, lighting, stairway and platform access, commercial layout, affecting Long Island Railroad, Metro-North Railroad, and Amtrak service Replacement of the catenary system Addition of four new stations, reconfigured interlockings, bridge rehabilitation, and additional power and communication infrastructure Environmental Assessment and Section 4(f) Evaluation issued for public and agency review. Of these projects, the initiatives that may have more of a regional effect include the Penn Station Access Improvements, which may have the potential for secondary development impacts in downtown Manhattan, and the Amtrak Gateway project, which would double rail access/egress capacity to/from Penn Station from/to New Jersey and points south via NJ TRANSIT and/or Amtrak. Improvements to Penn Station would also ease congestion and increase the station's appeal for accessing Amtrak intercity services in a similar time frame.

Interchange improvements proposed and highway widening can create the potential for more traffic, and this could create cumulative and secondary development impacts in the area of the improvements.

21.3 Environmental Consequences

Chapter 4 of the Tier 1 Final EIS addresses and compares the impacts of the Preferred Alternative, Alternative 90B, to those of the other alternatives considered, including the Base Alternative (refer to Section 4.24). Major new infrastructure investments, such as improvements to high-speed rail service, could potentially change the population and employment outlook. For example, according to a U.S. Conference of Mayor's Report, which examined the impact of high-speed rail upon the City of Albany, the introduction of high-speed rail along the corridor can contribute substantially to economic growth by driving higher-density, mixed-use development at train stations; expanding visitor markets and generating additional spending; broadening regional labor markets; and supporting the growth of technology clusters.⁴⁴ The potential effects of Base and the other Build Alternatives are described in more detail below.

21.3.1 Base Alternative

The station improvements recently constructed have the greatest potential to increase economic benefits to these two downtown areas, although the track improvements proposed will benefit freight movements (thereby offering indirect economic benefits to the industries served) as well as passenger rail service. With the Base Alternative, the potential for secondary development is relatively low. However, of the Base Alternative improvements, the recently completed relocation of the Niagara Falls Station from an industrial site outside the downtown to the former custom house building in downtown Niagara Falls has the greatest potential to improve the vitality of the downtown business district. Upgrades to the Schenectady and Rochester Stations also have a greater potential to support businesses in downtown Schenectady and Rochester than the other improvements comprising the Base Alternative.

This alternative has the lowest potential for secondary development and the ensuing environmental impacts (traffic, land use, community, wetlands, parklands, air quality, noise, etc.) of the alternatives under consideration, particularly since both Schenectady and Rochester were existing station sites, and the Schenectady Station was not relocated. Moreover, since both of the station sites are located in heavily urbanized areas, the potential for impacts to undeveloped lands, farmlands, and natural resources, such as wetlands, endangered species habitats, and farmlands impacts were also lower. Any secondary development in these urban locations is likely to involve redevelopment of existing developed sites. Although secondary development or redevelopment and changes in land use may not have been anticipated to occur under the Base Alternative, the Base Alternative may produce

⁴⁴ Economic Development Research Group, Inc. *The Economic Impact of High Speed Rail and Cities and their Metropolitan Areas*. Prepared for the U.S. Conference of Mayors (undated), released June 2010.

more indirect economic effects (increase in property values, increased business sales, increase in jobs) for the downtown areas.

21.3.2 Alternative 90A

The station improvements have the greatest potential to increase economic benefits to these cities, although the track improvements proposed will benefit freight movements (thereby offering indirect economic benefits to the industries served) as well as passenger rail service.

Secondary impacts would be similar to those described for the Base Alternative, with the highest potential for benefits and secondary development anticipated with new station buildings to be constructed at Amsterdam and Buffalo-Depew Stations. There may be more potential for secondary development in the City of Buffalo, as this station is more centrally located to business or industrial districts and is also a larger city. However, the Buffalo-Depew Station is located within an industrial area and physically isolated from nearby commercial activity. The existing Amsterdam Station is located on the western outskirts of the City of Amsterdam, and land use patterns include established residential neighborhoods, with limited commercial development or zones scattered in the surrounding area and somewhat removed from the existing station. If the new station buildings for Buffalo-Depew and Amsterdam are relocated closer to established commercial activity centers, there would be an increased potential for secondary development.

However, similar to the Base Alternative, this alternative has relatively low potential for secondary development and the ensuing environmental impacts (traffic, land use, community, wetlands, parklands, air quality, noise, etc.), given the type and degree of development around the existing station sites and the nature and limited scope of the proposed improvements. Moreover, since two of the station sites are located in heavily urbanized areas, the potential for impacts to undeveloped lands, farmlands, and natural resources, such as wetlands, and endangered species habitats impacts are also lower. Any secondary development in these urban locations is likely to involve redevelopment of existing developed sites. Although secondary development or redevelopment and changes in land use may not occur under the Alternative 90A, this alternative may produce greater indirect economic effects (increase in property values, increased business sales, increase in jobs) for the downtown areas served than the Base Alternative.

21.3.3 Alternative 110

With the added improvements in passenger rail service, this alternative would have a greater potential than the Base/90A/90B Alternatives to increase economic benefits to cities primarily at the station sites, although the track improvements proposed will benefit freight movements (thereby offering indirect economic benefits to the industries served) as well as passenger rail service. The highest potential for secondary development may occur at urban centers with station sites, given the availability of urban land to accommodate new development or redevelopment of existing developed sites. This effect may be more pronounced in the cities where express service will be provided: Niagara Falls, Buffalo-Exchange Street, Buffalo-Depew, Rochester, Syracuse, Albany-Rensselaer and New York City (Penn Station). However, if the factors are in place to support new development at less urban station sites (availability of land, zoning, infrastructure, market forces, etc.), there is a somewhat greater potential for larger changes in land use should redevelopment occur at more remotely located stations.

This alternative would have a greater potential for secondary development than the Base/90A/90B Alternatives due to the additional improvements in passenger rail service. However, the potential for any environmental impacts (traffic, land use, community, wetlands, parklands, air quality, noise, etc.) is minimized to some extent by the heavily urbanized nature of areas around many of the existing stations, which would limit the potential for impacts to undeveloped lands, farmlands, and natural resources, such as wetlands, and endangered species habitats. Any secondary development in these urban locations is likely to involve redevelopment of existing developed sites. Although secondary development or redevelopment and changes in land use may not occur under Alternative 110, this alternative may produce more beneficial economic effects (increase in property values, increased business sales, increase in jobs) for the downtown areas than the Base/90A/90B Alternatives.

21.3.4 Alternative 125

Although the 125 Study Area involves new construction along 236 miles, no new stations would be constructed on the new alignment, so secondary development impacts along the new right-of-way are not anticipated. However, of the alternatives under consideration, this alternative would have the greatest potential for secondary development because of the improvements in passenger rail service and travel times/ridership. Alternative 125 would involve a new station building in Rochester, but bypasses the Amsterdam and Buffalo-Depew Stations, so no improvements are proposed at these stations (beyond track improvements), which would be rebuilt under Alternatives 90B/110. Alternative 125 would involve express service that would stop at Albany-Rensselaer, Syracuse, Rochester, and Buffalo Exchange Street stations, while also maintaining existing Empire Corridor service. With the added improvements in passenger rail service, this alternative would have the greatest potential to increase economic benefits to cities primarily at the station sites, although the track improvements proposed will benefit freight movements (thereby offering indirect economic benefits to the industries served) as well as passenger rail service. The highest potential for secondary development may occur at urban centers with station sites, given the availability of urban land to accommodate new development or redevelopment of existing developed sites. However, if the factors are in place to support new development at less urban station sites (availability of land, zoning, infrastructure, market forces, etc.), there is a greater potential for larger changes in land use should redevelopment occur at more remotely located stations.

The potential for any environmental impacts (traffic, land use, community, wetlands, parklands, air quality, noise, etc.) is limited to some extent by the heavily urbanized areas around many of the existing stations. The urbanized character around the stations served by Alternative 125 would limit the potential for impacts to undeveloped lands, farmlands, and natural resources, such as wetlands, endangered species habitats, and farmlands impacts. Any secondary development in these urban locations is likely to involve redevelopment of existing developed sites. Although secondary development or redevelopment and changes in land use may not occur under Alternative 90B, this alternative may produce the greatest indirect economic effects (increase in property values, increased business sales, increase in jobs) for the downtown areas served.

Table of Appendices:

Appendix A – Corridor Investment Strategy

1.0 EXECUTIVE SUMMARY

Rail has long been important to New York's economy, and passenger trains have connected cities along the Empire Corridor since the early-1800s. The Empire Corridor from New York City to Buffalo and Niagara Falls is and has always been one of the most vital rail lines in the nation. The route between New York City and Albany-Rensselaer, offering 13 daily round-trips, is the third busiest intercity rail route in the nation. This passenger rail service is an important link among the cities and communities along the Corridor, providing transportation that uses energy effectively while delivering environmentally friendly public transportation between downtowns, and serving business and non-business travelers alike.

Given the Empire Corridor's importance, it is New York's vision to develop a modern intercity passenger rail operation that operates side-by-side with a modern, efficient freight rail network, without conflict and with broad economic benefits to passengers and shippers. On the Empire Corridor, upgraded passenger rail services can link the major cities across the state with high-quality, fast, frequent, and reliable transportation that can be competitive with automobiles, intercity bus services, and air travel. Improved Empire Corridor rail service can offer better mobility choices for passengers and an efficient system for moving goods and materials. An improved rail system will create jobs from the Port of New York to the Canadian Border as a vital part of our nation's freight rail network, while reducing our transportation carbon footprint and protecting the environment.

In the past 20 years, annual ridership on intercity passenger trains along the Empire Corridor has grown by over 500,000 passengers. Passenger trains along the Empire Corridor provide a convenient alternative to automobiles, reducing highway congestion. Recognizing the importance of intercity rail passenger service, New York has continually invested in new stations and vital infrastructure that has increased rail network capacity and provided passengers with modern facilities along the route. Carrying forward a vision for the future, New York has one of the largest state-supported programs for improving intercity rail passenger service in the nation, that has included installation of a second track between Albany-Rensselaer and Schenectady. New York has actively supported intercity rail passenger service on the Empire Corridor for over fifty years. It was one of the first states to add a state-supported train to the national network with restoration in 1974 of the train from New York City to Montreal, Quebec.

Rail service is an important component in New York's transportation network and the improvements outlined in the High Speed Rail Empire Corridor Program will initiate a new era of investments in the state's passenger railroad network. Enhancements to the intercity rail passenger network will complement the extensive commuter train system in the New York City metropolitan area that has become an integral part of lives of residents of 11 city and suburban counties served by the Metropolitan Transportation Authority (MTA). New York State-supported rail projects for both the Long Island Rail Road (LIRR) and Metro-North Railroad (MNR) have seen introduction of completely new fleets of electric multiple unit passenger equipment that was built in New York. This continual investment has created a reputation that New York commuter railroads are considered among the best and most reliable in the nation, with their focus on New York City at the heart of the Northeast Corridor. Now, investments as part of the High Speed Rail Empire Corridor Program will support rail as a modern, fast, and reliable part of the transportation network that spans the state from New York City to Niagara Falls.

As New York moves forward with its High Speed Rail Empire Corridor Program, with support from the Federal Railroad Administration (FRA), the state continues its commitment to supporting the

improvement of Empire Corridor intercity passenger rail service. This program lays the foundation for a greater level of investments and improvements than previously, continuing New York's 200-year legacy of supporting public transportation as far back as the Erie Canal and Mohawk and Hudson Railroad of the 1800s.

This Service Development Plan (SDP) outlines a series of short- and long-term investments to expand service and improve rail infrastructure across the state, building on a series of recent and ongoing projects sponsored over the past several years by the New York State Department of Transportation (NYSDOT). The plan is focused on delivering a set of program goals for New York State's High Speed Intercity Passenger Rail Program, that will move people and freight more efficiently along the Empire Corridor. This ensures that the corridor will continue to be a catalyst for business, jobs, and regional economic growth. Other critical components of the SDP focus on delivering world-class service that is safe for the communities served by the railroads, while preserving the environment and reducing carbon emissions. The SDP outlines how the New York rail system will meet the program's goals and demonstrates what can be achieved through a constructive partnership among federal, state, and local governments, private freight railroads, shippers, local business, and intercity rail passengers.

This SDP outlines in detail how the rail system is to be improved, how new services will be operated, funding needs, equipment requirements, and management systems to guide 25 years of continued investment. Chapters 2 and 3 provide background and explain the rationale for the program. Chapter 4 reviews alternatives considered during the National Environmental Policy Act (NEPA) process. Chapter 5 explains the development of the SDP and explores ridership trends. Chapter 6 discusses how the service will be operated, including equipment requirements, schedules, and travel benefits. Chapter 7 provides the phased sequence of capital projects that will be constructed over a 25-year period to accomplish the program, and the funding requirements. Chapter 8 explains funding and management of the work. Chapter 9 assesses the benefits expected to result from program implementation.

The program's benefits are extraordinary. Investment in intercity passenger rail and high speed rail is motivated by the desire to realize direct passenger benefits associated with faster, safer, and more reliable travel, and broad-based community benefits of improved environmental quality, reduced air and highway congestion, and economic development. Passenger rail improvements create economic impacts in the form of travel time savings for rail users, reduced congestion on other transportation modes, and regional productivity gains resulting from more efficient access to larger labor and trade markets. These savings cascade through the economy, creating jobs, increasing overall economic activity, and raising personal income.

The program requires the phased expenditure of \$7.323 billion over 25 years, to continually grow track and signal capacity and straighten sharp curves to support higher operating speeds.¹ The program would add 283 miles of new passing track and 39 miles of new fourth track and upgrade antiquated signal systems, greatly increasing operating flexibility for both freight and passenger trains. Stations are to be upgraded a modernized and station sidings expanded, adding platform flexibility and capacity so that trains no longer stack at stations while awaiting platform space.

For travelers, the 9 hour 6 minute New York City-Niagara Falls trip would be cut by 1 hour and 30 minutes, to 7 hours and 36 minutes. The greatest share of this travel time savings would occur between Albany and Niagara Falls, where current passenger/freight train conflicts are most

¹ The Tier 1 Environmental Impact Statement (EIS) evaluates a 20-year improvement program. The program is extended in this SDP to align work with past and expected future rates of spending of approximately \$240 - \$250 million annually.

frequent and severe. For this segment, travel times would improve by 75-80 minutes, from 5 hours 58 minutes to under 5 hours, a dramatic improvement. Schedule reliability – the percent of trains arriving on time at their final destination – would improve from fewer than 80% of trains reaching their terminus on time to more than 95% doing so. Four new round trip trains would be added over the 464-mile length of the Corridor, bringing scheduled service from 13 to 17 daily trains between NYC and Albany – and introducing hourly service during weekday morning and evening peak periods² over this busy segment. Two of these 17 trains will take advantage of the new track improvements and, by servicing selected stops, offer for the first time a 2-hour trip run time between New York City and Albany, providing a new standard for High Speed rail. The additional 4 daily trains will increase service between Albany and Niagara Falls from 4 daily trains to 8 trains, a doubling of train frequency among the major upstate cities. Together, these improvements and additional service will make intercity rail far more attractive as an alternative to driving and flying. The program is predicted to attract more than one million additional annual rail trips by 2040³, for a total of 2.7 million annual trips; this would be nearly a 68% increase over the 1.6 million annual trips recorded for 2016.⁴

In addition to these direct travel benefits, the program will address pressing safety, environmental and energy concerns. By speeding trains and shifting more than one million travelers to rail from other modes, the program will reduce locomotive fuel consumption by over 500,000 gallons of diesel fuel, eliminate or avoid 67 million pounds of air pollutant and greenhouse gas emissions, conserve nearly 400,000 billion British Thermal Units (BTUs) of energy as travelers switch to more energy-efficient rail services, and avoid 117 roadway accidents. Over its 25-year implementation period, the program investments will create 55,676 job-years of employment, and the direct hiring of 150 additional rail system workers. Yet these investments will add only \$68 million in annual cost to operate and maintain Empire Corridor passenger rail service, while generating \$62 million in annual ticket revenues, increasing the line's operating deficit by only \$6 million annually (all costs in 2017 dollars). These direct travel and indirect benefits are quantified in Exhibit ES-1.

New York's economy and its communities have enjoyed the power and efficiency of a robust rail system for more than a century. As population and employment continues to grow, and as upstate cities evolve beyond their industrial origins to increasingly thought-content economies (education, medicine, technology), the importance of the rail system only increases. The program discussed in this report offers a cost-effective and efficient set of improvements that leverage past investments to grow local and regional economies, increase travel choices, and broaden job opportunities for half the state's 20 million residents.⁵ Through this program, New York can remain among the nation's pre-eminent economic engines while continuing to attract top talent and offer its citizens a high quality of life by continuing its strong rail orientation and building on past success.

² The weekday peak period is normally considered to be a facility's (or a line's) highest volume 3-hour use period, typically 6:30 – 9:30 a.m. and 4:00 – 7:00 p.m. (although this can vary depending upon travelers' use habits for a particular facility or service). This concept does not apply to Saturday or Sunday travel.

³ These data refer to one-way trips, one traveler making a single trip from an origin to a destination. The number of round trips would be half these values.

⁴ Although the Tier 1 Final EIS forecast one million additional riders over 20 years in response to a 90-minute total travel time savings, this SDP recognizes a 25-year period and slightly greater travel time benefits (94 minutes), including four minutes of additional time savings from double-tracking the Schenectady-Albany single track segment that was not considered in the Tier 1 EIS. Applying travel and cost elasticities from the demand forecasting model to the additional four minutes of travel time benefit generates 83,000 more riders, for a total of 1.083 million one-way trips.

⁵ Based on 2010 Census and counted population 2011-2015;
<http://population2016.com/population-of-new-york-in-2016.html>.

Cumulative Totals	24	66	97	126,118	173

Key

Travel Time Savings per Train Each Year, Summed over 5-Year Periods (minutes)	The total scheduled minutes saved due to increased train speeds in each year for each train to which the travel time benefit applies, totaled over each 5-year period. Thus, in Year 1 there is no change in travel time for any Empire Corridor trains (no projects are yet completed); in Year 2 every train will gain 2 minutes more than in Year 1 (since all trains traverse the Empire Corridor South segment); in Year 3 every train will travel 2 minutes faster than in year 2; in Year 4 every train will travel 2 minutes faster than in Year 3; and in Year 5 every train will travel 4 minutes faster than in Year 4. The total effect of the Years 1-5 improvements is that every Empire Corridor train in Year 5 will travel 10 minutes faster than they did in Year 1. In Years 6-25, improvements ultimately producing an 84-minute additional time savings will be confined to the Empire Corridor West segment, and only the eight trains traveling beyond Albany to Niagara Falls and back will receive the travel time benefits for each year of improvements; the other 13 NYC-Albany trains will not see any additional travel time improvements.
Total Minutes of Delay Saved Each Year, Summed over 5-Year Periods (minutes)	The product of the reduction of train operating minutes for each train due to improved on-time performance (NYC – Niagara Falls) and the number of trains to which the reduction applies in each year, totaled over each 5-year period. Thus, if the improvement in on-time performance in a particular year results in a 3-minute reduction of delay for four weekday trains, and a 1-minute reduction of delay for nine other weekday trains, the total delay reduction over the entire year would be 5,460 minutes. Over five years, the reductions in delay accomplished in each of the five years are added together to express the reduction in delay at the end of the five-year period compared to the delay at the beginning of the five-year period.
Ridership Increase Each Year, Summed over 5-Year Periods (one-way trips)	The total increase in one-way trips by passengers for all origin-destination pairs (among 17 stations, including Saratoga) in a given year, totaled over each 5-year period. For example, in Year 3, the 2-minute travel time savings achieved through program improvements will draw approximately 55,219 new passengers (each making a single trip) from auto/bus/air to rail. ⁶

⁶ The same travel time savings may produce slightly different ridership gains in different years because the savings occurs at different areas along the Empire Corridor, with benefits flowing to different origin/ destination pairs with different base ridership values.

Mode Shift Fare Cost Savings Each Year, Summed over 5-Year Periods (dollars)	Total fare costs saved by passengers switching to rail from other modes each year (auto mode uses \$0.17/mile + tolls; bus, air and rail use 2010 fares, inflated to 2017 on the basis of northeast Consumer Price Index; https://www.ssa.gov/OACT/STATS/cpiw.html), totaled over each 5-year period.
Passenger Train Energy Savings Each Year, Summed over 5-Year Periods (gallons of diesel fuel)	Gallons of diesel fuel saved due to the reduction in total minutes of delay for locomotives as a consequence of improved on-time performance, plus the reduction in total minutes of operation due to higher speeds, each year, totaled over each 5-year period. This metric is derived based on locomotives burning 70 gallons of diesel fuel per hour of operation (as an average value across all speeds, including stopped). Thus, if the program improvements in a particular year reduce delay by 6,000 minutes (100 hours), then the savings would be $100 \times 70 = 7,000$ gallons of diesel fuel saved. For Years 1-5, 35,272 minutes – or 588 hours – of delay are saved, and daily trains also receive annual travel time savings of (Year 1) 0 minutes, (Year 2) 2 minutes for all 26 trains, (Year 3) 2 minutes for 30 trains, (Year 4) 2 minutes for 32 trains, and (Year 5) 4 minutes for 34 trains, adding 113,880 – or 1,898 hours – of travel time improvement. The total time savings resulting from reduced delay and faster speeds is therefore 149,152 minutes, or 2,486 hours. This reduced time of operation yields a diesel fuel savings Years 1-5 of 2,486 hours \times 70 gallons/hour = 174,010 gallons.
Passenger Train Emissions Savings Each Year, Summed over 5-Year Periods (metric tons of regulated pollutants + GHG)	Metric tons of diesel-range pollutants + CO ₂ emissions avoided in each year (based on 22.2 ⁷ pounds of CO ₂ conserved for each gallon of diesel conserved), totaled over each 5-year period. Thus, for Years 1-5, given a savings of 174,010 gallons of diesel fuel, then $174,010 \times 22.2 = 3,863,037$ pounds of pollutants saved. As a metric ton is 2,204 pounds, this translates into 1,753 metric tons of pollutant emissions saved.

⁷ Emission factors for diesel fuel were provided at https://www.epa.gov/sites/production/files/2015-07/documents/emission-factors_2014.pdf

Mode Shift Energy Savings Each Year, Summed over 5-Year Periods (millions of BTUs)	<p>Millions of British Thermal Units (BTUs) of energy conserved in each year (totaled over each 5-year period): the net of total additional energy used or conserved from increased rail operations and maintenance (increased) and reduced on-road operations and maintenance due to mode shift of travelers to rail. The Tier 1 Final EIS notes an overall reduction in energy consumption by Empire Corridor travelers of 391,227 million BTUs saved in 2035 due to full program implementation and the diversion of 1,083,000 trips from auto/bus/air to rail. Allocating this total savings on the basis of ridership diverted each year in response to gradual improvements in reliability and speed, an equivalent portion of the overall energy savings is assigned. The value in the Tier 1 Final EIS is derived from industry standard energy profiles for auto, bus, air and rail travel, with increases in rail energy consumption (due to more trains to carry more passengers) offset by decreases in energy use by auto/bus/air as travelers divert to rail. Thus, if the total energy savings is due to the diversion of 1.083 million trips from auto/bus/air to rail in 2035, then the proportion of that diversion represented by each year's ridership gains (totaled over Years 1-5) applied to the total 391,227 million BTUs conserved yields the energy savings in that year due to mode shifts among Empire Corridor travelers. In Years 1-5, 221,952 trips – or 20.4% of the total 1.083 million trips diverted by Year 25 – are diverted from auto/bus/air to rail. Applying the 20.4% to the total 391,227 million BTUs saved over the entire 25-year program produces a result of 80,148 million BTUs saved.</p>
Mode Shift Emissions Savings (metric tons of regulated pollutants + greenhouse gas [GHG])	<p>Metric tons of emissions avoided for all regulated pollutants⁸ + CO₂ in that year (totaled over each 5-year period): the net of total additional emissions produced or avoided from increased rail operations and maintenance (increased) and reduced on-road operations and maintenance due to mode shift of travelers to rail (avoided). The Tier 1 Final EIS notes an overall reduction in energy consumption by Empire Corridor travelers of 33,188 metric tons of CO₂ saved in 2035 due to full program implementation and the diversion of 1,083,000 trips from auto/bus/air to rail. Allocating this total savings on the basis of ridership diverted each year in response to gradual improvements in reliability and speed, an equivalent portion of the overall energy savings is assigned. The value in the Tier 1 Final EIS is derived from industry standard energy profiles for auto, bus, air and rail travel, with increases in rail energy consumption (due to more trains to carry more passengers) offset by decreases in energy use by auto/bus/air as travelers divert to rail. Thus, if the total energy savings is due to the diversion of 1.083 million trips from auto/bus/air to rail in 2035, then the proportion of that diversion represented by each year's ridership gains (totaled over Years 1-5) applied to the total 33,188 metric tons of CO₂ conserved yields the emissions reduction in that year due to mode shifts among Empire Corridor travelers. In Years 1-5, 221,952 trips – or 20.4% of the total 1.083 million trips diverted by Year 25 – are diverted from auto/bus/air to rail. Applying the 20.4% to the total 33,188 metric tons of CO₂ saved over the entire 25-year program produces a result of 6,799 metric tons of CO₂ saved. Adding the small amount of criteria pollutant emissions avoided (dwarfed by the amount of CO₂ generated burning diesel fuel) produces the result in the table of 6,823 metric tons of emissions saved.</p>

⁸ Regulated Pollutants include CO, HC, NO_x, SO_x, PM_{2.5}, PM₁₀, Ozone, Lead (Pb). Reductions in regulated pollutants are dwarfed by reductions in CO₂ due to cleaner engines and the conversion of 99% of diesel fuel to CO₂ during combustion.

Mode Shift Safety Savings (accidents)	<p>Total accidents avoided due to mode shift from auto/bus/air to rail in each year, totaled over each 5-year period. This metric is derived using data provided by the National Transportation Safety Board and other official sources for accidents per million passenger-miles of travel by air, bus, auto and rail. The accident rates used are:⁹</p> <p>Auto 1.602941802 accidents/million passenger miles Bus 0.203433744 accidents/million passenger miles Air 0.000046892 accidents/million passenger miles Rail 0.011235955 accidents/million passenger miles</p> <p>Employing these drivers, for each 100 passengers diverted to rail, and applying the diversion percentages derived from the travel demand forecasting model of 50/30/20 for bus/air/auto, and the average trip lengths among origin-destination pairs embedded in the 2010 trip table that is the basis for all travel demand forecasting associated with this program, the reduction in accidents is derived as $(50 \times 0.203433744 \times \text{the average trip distance}) + (30 \times 0.000046892 \times \text{the average trip distance}) + (20 \times 1.602941802 \times \text{the average trip distance}) - (100 \times 0.011235955 \times \text{the average trip distance}) = \text{the net accidents avoided for each 100 travelers diverted to rail.}$</p>
Job Creation Each Year, Summed over 5-Year Periods (job- years)	<p>Total job-years created across all economic sectors due to construction activity, increased rail operations (direct employment), and increased related economic activity (indirect employment) in each year, totaled over each 5-year period. Although the metric provides a final number in the 25th year, the additional job-years created by the 25th year of the program due to increased rail operations is perpetual, resulting in 2,702 additional permanent employees on the railroad system. A Transportation Economic Development Impact System (TREDIS) model was used to develop total economic activity flowing from rail improvement investments, across all economic sectors. A total of 55,777 total job years¹⁰ were predicted to result from the construction over the 25-year program term.¹¹ These were allocated proportionally by year on the basis of annual program investments accumulated in five-year segments.</p>

⁹ Multiple sources.

¹⁰ An analysis by HNTB resulted in an estimate of 2,129 job-years/year for the program at a \$6 billion funding level. Escalating this to \$7.323 billion and adding the job-years created due to the ripple effect of permanent railroad jobs added as infrastructure maintenance and operational needs expand, and then subtracting the direct rail jobs created to staff this infrastructure maintenance and operations produces the 55,777 job-years value attributed to the program.

¹¹ On a national standard, each \$1 billion of investment typically generates 7,700-8,100 job-years. Applying that metric range produces a range of potential economic impacts for the \$7.323 billion program of 56,378 – 59,316 job years created.

Direct Employment Each Year, Summed over 5-Year Periods (rail system jobs)	Additional rail jobs required to operate and maintain new infrastructure and additional trains, as needed in each year as improvements are built or new train service is added, totaled over each 5-year period. These were derived using industry-standard metrics of workers per unit of rail infrastructure (miles of track or number of switches, square footage of stations, per train crew requirements). For train crews, a distinction is made if trains are weekday only (two crews) or seven days a week (three crews). Train crew values also recognize contractual requirements for layover, hours of service limitations, and other factors that affect staffing requirements. Infrastructure maintenance staffing is a direct function of unit values, as maintenance staff are typically assigned to and pick jobs on a single-shift basis.
---	--

2.0 INTRODUCTION

The Federal Railroad Administration (FRA) and the New York State Department of Transportation (NYSDOT) are completing a Tier 1 Environmental Impact Statement (EIS) that evaluates options for improving intercity passenger rail services along the 464-mile Empire Corridor between Pennsylvania (Penn) Station in New York City and Niagara Falls Station in Niagara Falls, New York. In 2010, NYSDOT received a grant from the FRA with which to develop alternatives for improving the Empire Corridor rail system, to conduct the evaluation of these alternatives pursuant to the National Environmental Policy Act (NEPA), and to prepare this Service Development Plan (SDP) for the selected alternative to describe its feasibility, costs, sources of funding, and operation.

The SDP serves as the business, institutional and organizational plan guiding implementation of the High Speed Rail Empire Corridor Program. The SDP lays out the approach for implementing proposed capital projects and higher-speed rail services that will meet the program goals outlined in the Tier 1 Final EIS. The implementation plan for the SDP requires the generation of a prioritized capital program, a ten-year financial plan, institutional and stakeholder arrangements and agreements, and a program management plan. The institutional arrangements will address asset owners, program sponsors, and railroad and stakeholder agreements defining roles and responsibilities for implementation of the proposed program and new and expanded service. The SDP is required for the program to be eligible to receive FRA funding. A completed SDP demonstrates to the FRA that the program has been defined in sufficient detail – and proven physically, financially, and operationally feasible – to be ready to progress to the implementation phase.

High quality transportation links between New York’s northern metropolitan areas and New York City have been key to its economic success for over 200 years. Past investments in the Erie Canal, railroads, the New York State Thruway (Thruway), and airports have played major roles in the growth and prosperity of the state. In each case, New York was a leader in recognizing the role of transportation in growing and sustaining the state’s economy.

New York has been planning to improve its intercity rail service along the Empire Corridor from New York City to Niagara Falls for more than 30 years. In the past 20 years, annual ridership on intercity passenger trains traveling on the Empire Corridor has grown by over 500,000 passengers, to 1.6 million in 2016. Recognizing this growth and the importance of the rail system to sustain it, the state has invested with increasing focus on the provision of high quality, fast, and efficient intercity passenger rail services – and the equipment, facilities, new development, jobs, and community revitalization that are a direct result – are statewide benefits. Further enhancements to the New York City-Niagara Falls rail network will complement the New York City metropolitan area’s already extensive commuter rail system, considered the best and most reliable in the nation. This rail network helps people in 11 counties live and work with less dependence on automobiles and more time for business and families, lower levels of traffic congestion, less air pollution, in denser and more walkable towns and cities oriented around train stations rather than highway interchanges.

With support from New York State, both the LIRR and Metro-North Railroad (MNR) have seen the introduction of new fleets of electric multiple unit passenger equipment that was itself built in New York. Future investments under the High Speed Rail Empire Corridor Program will build on these successes by creating a rail network spanning the state’s major cities from New York City to Niagara Falls. With Buffalo’s emerging resurgence as a post-industrial educational and

research center to Albany's development of a world-class nano-tech hub to Rochester's recalibration of its economy from film to optics, the key transportation linkages provided by the Empire Corridor are the backbone of the state's continued economic development among its major cities.

The benefits of increased state investment are obvious. New York has consistently invested in the MTA's commuter rail systems, providing critical support for New York City's continued growth and development as a world financial, science, educational, arts and business center. The result of years of investment in New York City metropolitan area mass transit is the largest, most reliable, and most intensively used commuter and subway network in the nation.

New York's intercity rail system needs a similar set of investments. The Northeast Corridor from Washington D.C. to Boston serves a critical megalopolis housing 15% of the nation's population and accounting for 20% of the nation's Gross Domestic Product. The Empire Corridor branch of this network plays the crucial role of joining New York's major cities of Buffalo, Rochester, Syracuse, and Albany to this economic hub, and must receive the focus appropriate to so important a resource. It is the Empire Corridor that enabled these cities to grow and prosper through the 20th Century, and that must continue to support their local economies through higher-speed service that broadens their economic bases, extends their reach, expands job markets, and facilitates business connectivity in a key economic corridor. Recent investments for improvements at Rochester, Albany, Niagara Falls, and Schenectady are already freeing passenger rail service from freight rail conflicts that have resulted in years of unreliable and slow service. Building on these initial investments, the state must add tracks and switches, upgrade signals, improve and modernize stations, expand platform space to add critical train capacity, smooth curves for higher speed, and remove one-track bottlenecks that delay passenger trains behind slower-moving freight trains. Only through a focused and comprehensive program of such rail improvements will New York be able to support the continued growth of upstate economies and, by extension, the economic fortunes of the state as a whole.

This SDP outlines such a program. After five years of careful analysis, NYSDOT has identified a suite of improvements that can be built with available and anticipated funding without interfering with existing passenger and freight services. It will confer gradual and continuing benefits to both passenger and freight services sharing the busy Empire Corridor section between Albany and Niagara. In so doing, it will bolster center-city renaissance while supporting key business and educational institutions and improve linkages between upstate towns and the capital and New York City.

The program will have broad benefits, improving freight and goods movement, train travel, the local and regional economy, town centers and surrounding communities, and the environment.

Moving More People and Goods

New York City metropolitan area transportation facilities are at capacity for large periods of every workday. The transport of people and goods by rail is one of the few remaining viable options for continuing to grow the City's and the State's economies. Rail freight volumes on CSXT and Canadian Pacific (CP) Rail will continue to grow, and only through carefully designed improvements in the existing right-of-way over which Empire Corridor trains and CSXT/CP Rail freight trains share tracks can these critical economic trends be sustained. The need to upgrade the track and signal infrastructure is immediate and pressing and must be addressed for New York to remain economically competitive.

The improvements outlined in this report will accelerate the movement of people and goods by rail, increasing reliability and decreasing trip times between major destinations for business travelers, students, and recreational travelers alike. In response, ridership is anticipated to grow significantly, from the 1.6 million current Empire Corridor passengers to 2.7 million after implementation of the full program.¹²

Travel time is expected to be reduced by 75-80 minutes between Albany and Niagara Falls, and between 10-15 minutes between Albany and New York City. Two of the 17 daily trains between New York City and Albany will bypass some stops in order to achieve a 2-hour travel time, a breakthrough that is expected to induce even more demand for passenger rail services on this already heavily traveled leg. Thousands of students and educators at colleges and universities in Albany, Syracuse, Rochester, and Buffalo will enjoy quicker and more reliable connections to research centers in New York City, broadening the reach of tech centers and analytical research and fostering continued evolution of upstate cities as major educational hubs. And more freight will be able to be moved on a “just in time” basis rather than “as scheduled,” reducing costs, simplifying supply chain logistics, and providing a competitive edge for New York businesses and manufacturing centers.

Catalyzing Economic Growth

New York’s origins as an industrial manufacturing center remain important today; the state was once the center of rail transportation technology and innovation. The remaining industries that are still tied to the rail network are a mix of advanced and traditional technology involving both blue- and white-collar labor forces. To provide the capital improvements, equipment and services proposed for the Empire Corridor in this report, 173 permanent jobs would be created to operate the rail system, and some 55,777 job-years of additional employment created in constructing and operating it over a 25-year implementation period.¹³ This economic infusion will be multiplied as dollars invested in the rail system play through upstate economies, fostering greater economic activity broadly beneficial to the entire Empire Corridor.

Revitalizing Communities

In addition to speeding main-line passenger and freight rail services, the program fosters improved intermodal connections in upstate cities. This intermodal access to local economic activity centers is central to local community revitalization, as it provides non-auto-based mobility solutions that free cities from auto dominance, opens downtowns to walkable environments, and propels greater community interaction centered around rail stations and their feeder bus and light-rail systems. As such, speeding of the Empire Corridor intercity passenger and freight services helps bolster in-city economic initiatives while linking upstate cities together and to the economic engine that is New York City.

Preserving the Environment

Investments in rail strengthen the environment, even as they help solidify communities and in-city economies. Rail is the most space and energy efficient means of moving people and goods, enjoys standard technologies long proven in service, and reduces air pollution and noise generated through other means of travel. Overall, investments in rail continue to repay significant

¹² Although the Tier 1 Final EIS forecast 1 million additional riders over 20 years, this SDP recognizes a 25-year growth period, and slightly greater travel time benefits (94 minutes rather than 90 minutes as per the EIS), resulting in slightly more ridership (1.1 million).

¹³ The long-term impact of 173 permanent rail system jobs continues past the 25-year analysis horizon. Construction jobs – and their multiplier effect on local economies – dissipate after completion of the program.

environmental and economic dividends measured in decades, propelling economic growth while preserving communities and the region from the environmental degradation that results from dependence on automobiles.

The High Speed Rail Empire Corridor Program outlined in this report does all of these things. It eliminates bottlenecks and chokepoints on one of the nation's most heavily used freight and passenger rail lines. In so doing, it will improve reliability from the current condition, where more than 20% of trains arrive late, to a dependable and consistently reliable service where more than 95% of trains can be expected to arrive on time. By renewing and modernizing stations and station track switch and signal systems, it increases platform capacity, allowing more trains to operate and to grow with increasing ridership. And it provides all these benefits while accommodating continued growth in the essential rail freight market on this central freight spine between Albany, Chicago and Toronto, and points west.

With completion of the environmental analysis of the corridor in the Tier 1 Final EIS, and with selection of the best alternative for accomplishing these critical mobility objectives, New York is poised to engage the program and to work with its transportation partners to make this vision a reality. The technology has been identified. And the need for action is fully evident. New York will now engage funding opportunities and work with the owners and operators of these freight and passenger services to begin delivering on a plan for fast, efficient, reliable, and attractive intercity rail services to benefit New York residents and businesses, in keeping with its laudatory history of continued rail-oriented economic development.

2.1 What is the Empire Corridor?

The 464-mile Empire Corridor is a rail network that links all of the State's major cities, extending from New York City's Pennsylvania Station north through Yonkers and Poughkeepsie to Albany, and turning west to travel through Schenectady, Rome, Utica, Syracuse, Rochester, and Buffalo to terminate at Niagara Falls. The Corridor consists of three main geographic segments which were defined in the Tier 1 Final EIS:

- **Empire Corridor South (ES)**, extending 142 miles north from Penn Station to just north of Albany-Rensselaer Station;
- **Empire Corridor West (EW)**, extending 294 miles west from approximately one mile north of the Albany-Rensselaer Station to just east of the Buffalo-Exchange Street Station; and
- **Niagara Branch (NF)**, extending 28 miles west from a point located just east of Buffalo-Exchange Street Station to Niagara Falls.

These project segments have been defined to support infrastructure project construction packaging and phasing, and to more precisely address stakeholder railroad ownership and operation. NYSDOT has recently redefined the Corridor as comprising two major segments: the **Empire Capital District Connection**, from New York City to Albany and Schenectady, and the **Empire Gateway**, extending west from Schenectady to Niagara Falls. These designations capture recent system improvements as they relate to travelers' daily experience. Exhibit 2-1 shows these designations.

Exhibit 2-1 Empire Gateway and Empire Capital District Connection Segments

In subsequent sections of this SDP, both naming conventions are used. For purposes of analysis of the rail system operation, the Corridor is subdivided into smaller segments, to aid understanding of service and infrastructure improvements as they involve different asset owner(s) and operator(s), and as they relate to future packaging of infrastructure upgrades. These sub-segments are as follows (Exhibit 2-2):

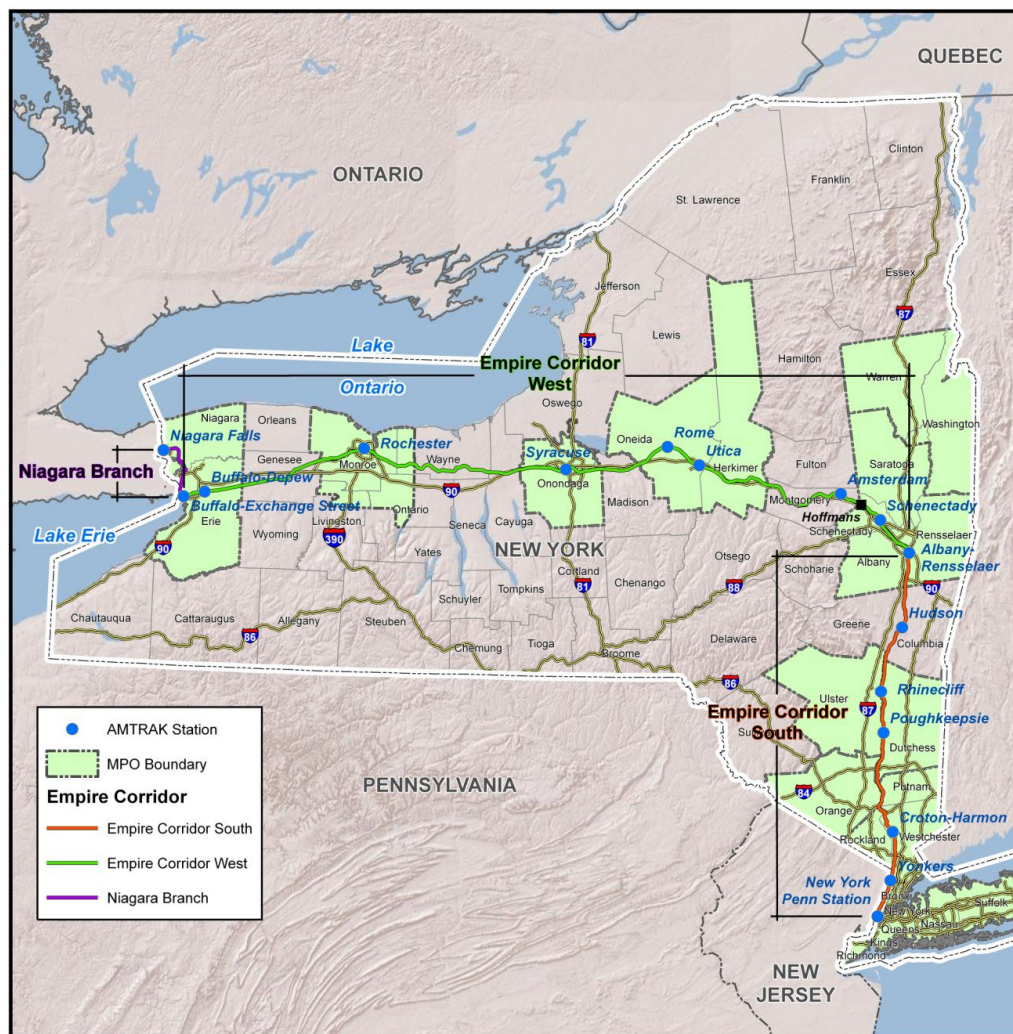

Exhibit 2-2 Empire Corridor Sub-Segments

Operating Segment	Primary Segment	Limits
West Side Connection	Empire Corridor South	New York City to Spuyten Duyvil Milepost 0 - 12
Lower & Mid-Hudson Valley	Empire Corridor South	Spuyten Duyvil to Poughkeepsie (CP75) Milepost 12 – 75
Upper Hudson Valley	Spans Empire Corridor South and Empire Corridor West	Poughkeepsie (CP75) to Hoffman's Milepost 75 – 169
Empire Corridor – West	Empire Corridor West	Hoffman's to Niagara Falls Milepost 169 – 464

2.2 Related Improvements

In recent years, NYSDOT has invested heavily in improved service and infrastructure upgrades for the Empire Corridor (Exhibit 2-3). As part of the original “Base” condition for the corridor¹⁴, NYSDOT identified a series of infrastructure enhancements that would relieve or eliminate significant bottlenecks and choke points along the Corridor, with estimated costs of approximately \$500 million (2015 dollars). To date, NYSDOT has already accomplished many of these projects, setting the stage for implementation of the Preferred Alternative that is the subject of this SDP.

Exhibit 2-3 Project Location Map

Among the improvements NYSDOT has completed are the following (project designations key to NYSDOT project lists)

- Hudson Line Signal Reliability; ES-3

¹⁴ See *Empire Corridor Tier 1 Final Environmental Impact Statement* for a complete description of the alternatives considered to improve service in the Empire Corridor.

- Hudson Line Highway-Rail Grade Crossing Safety Improvements; ES-1
- Albany-Rensselaer Station Fourth Track Capacity Improvements; ES-9
- Niagara Falls International Railway Station and Intermodal Transportation Center – New Intermodal Transportation Center; EW-13

In addition, projects funded and in construction include:

- Albany – Schenectady Double Track; ES-10
- Schenectady Station Renovation / Platform Improvements; EW-01
- Syracuse Track Configuration and Signal Improvements; EW-6, and
- Rochester Station Re-development / Operating Improvements; EW-19.

Together, these projects have and will continue to increase train speeds in the most heavily traveled sections of the Empire Corridor, increase capacity to enable more trains to operate without conflicts, and substantially improve schedule reliability. As such, NYSDOT's efforts since 2015 set the stage for the next wave of improvements needed to further upgrade passengers' experience and increase ridership. Some of NYSDOT's more prominent accomplishments to date are below.

Albany-Rensselaer Station and Track Improvements

Service on the Empire Corridor is anchored at Albany-Rensselaer Station. Track projects recently completed at this station included lengthening the platform to accommodate longer trains and the installation of a fourth station track. Signal and track improvements at Albany-Rensselaer now allow for the station to accommodate four passenger trains at platforms while also handling other yard movements and locomotive changes. Exhibit 2-4 shows the new Albany-Rensselaer Station with the recently completed improvements to the Interlocking CP 142 and installation of the fourth station track. This improvement increases platform and switch capacity, permitting more trains to operate through the station than previously.

Exhibit 2-4 Interlocking CP 142 and New Fourth Station Track at Albany-Rensselaer, New York

At Niagara Falls, a new state-of-the-art station has streamlined station operations and accommodation of passengers crossing the international border from Canada, including new facilities for the Department of Homeland Security used for screening of passengers. Exhibit 2-5 shows the new station. The station's new Custom and Immigration facilities allows passengers entering the United States from Canada to pass through customs more reliably.

Exhibit 2-5 New Niagara Falls Station

A new Rochester Station was recently completed. It will allow two passenger trains to serve the station on a new high-level platform, which will reduce conflicts and increase capacity of the CSXT's Rochester Subdivision. Another station project underway at Schenectady will provide a new station replacing a facility nearing the end of investment life. This new station at Schenectady will complement other improvements in the city with the opening of new tourist and art attractions in the area near the station location.

Also at Syracuse, interlocking and signal projects now under development will help improve operations for both passenger and freight trains. The Rochester station is shown in Exhibit 2-6.

Exhibit 2-6 New, recently completed station at Rochester

3.0 PROGRAM PURPOSE AND NEED

The purpose of the High Speed Rail Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and improve reliability, travel times, service frequency, and passenger amenities. The High Speed Rail Empire Corridor Program will improve passenger rail service along the corridor and, in so doing, attract additional passengers, increase travel choices, and contribute to a balanced, multi-modal transportation system.

Improved service along the Empire Corridor will better connect the principal population centers of western New York State with Albany and New York City, further enhancing connections to Northeast Corridor passenger rail service (Philadelphia and Washington) and other markets (Midwest and New England) and facilitating international travel to Canada. Its location within one of the most populated regions in the country, as well as its importance to national and international freight traffic, underscores the importance of the Empire Corridor to regional development. Providing time-sensitive and efficient service will, in turn, promote economic vitality, improve quality of life for residents, and reduce automotive travel and emissions.

3.1 Program Needs

The High Speed Rail Empire Corridor Program was undertaken to address two primary transportation and mobility needs:

- Reduce Infrastructure Constraints – eliminate chokepoints and bottlenecks where insufficient track, signal or station platform capacity impedes the ability of trains to progress along the right-of-way or causes conflicts between freight and passenger services sharing the same track(s); and
- Accommodate Existing and Projected Future Travel Demand - ensure the provision of attractive, cost-competitive, and modern passenger rail services to enable those wishing to travel by rail to do so, and to draw travelers from other, less efficient modes in response to speed and reliability improvements.

To address these two fundamental Corridor needs, the following program objectives were defined:

- Improve On-Time Performance (OTP), a key measure of schedule reliability;
- Reduced travel time;
- Increase service frequency;
- Increase ridership;
- Reduced dependency on automobiles in the corridor; and
- Minimize interference with freight rail operations.

By designing a program of projects and service improvements to accomplish these program objectives, NYSDOT intends to deliver cost effective, modern, efficient, reliable, and speedy passenger rail service over the entire Empire Corridor, leveraging anticipated population and economic growth to increase ridership, reduce local road congestion, support and focus downtown development, draw local investment to city centers, and thus strengthen New York's and the nation's economies.

3.2 Description of Transportation Network in the Corridor

Travelers along the Empire Corridor enjoy a robust transportation network, with train, bus, airplane, and automobile alternatives to access the Corridor's major destinations. These are described in the following sections.

3.2.1 Auto Network

During 2015, there were over 55 million automobile trips on the New York State Thruway between Exit 26 (Schenectady - Scotia - I-890 - NY Routes 5 and 5S) and Exit 50 at Buffalo/Niagara Falls - I-290. Travelers destined for the western cities of Syracuse, Rochester and Buffalo from New Jersey may also travel via I-80 west to I-81 as an alternative routing.

3.2.2 Bus Network

Along the Empire Corridor motor coach operations provide services between New York City, Albany, Utica, Rome, Syracuse, Rochester, Buffalo and Niagara Falls. These buses are generally less expensive than Amtrak services and are somewhat faster barring significant traffic on the major highways on which they rely. They are considered less comfortable than rail or air travel and are generally not preferred by travelers except for reasons of economy or for trips to destinations other than the central business district. Buses from New York City originate at the Port Authority Bus Terminal in midtown Manhattan, and typically confront high levels of traffic congestion entering and exiting the facility, and congestion and delay on the Hudson River crossings. Buses from Newark use the New Jersey Turnpike or I-80 depending upon their destination.

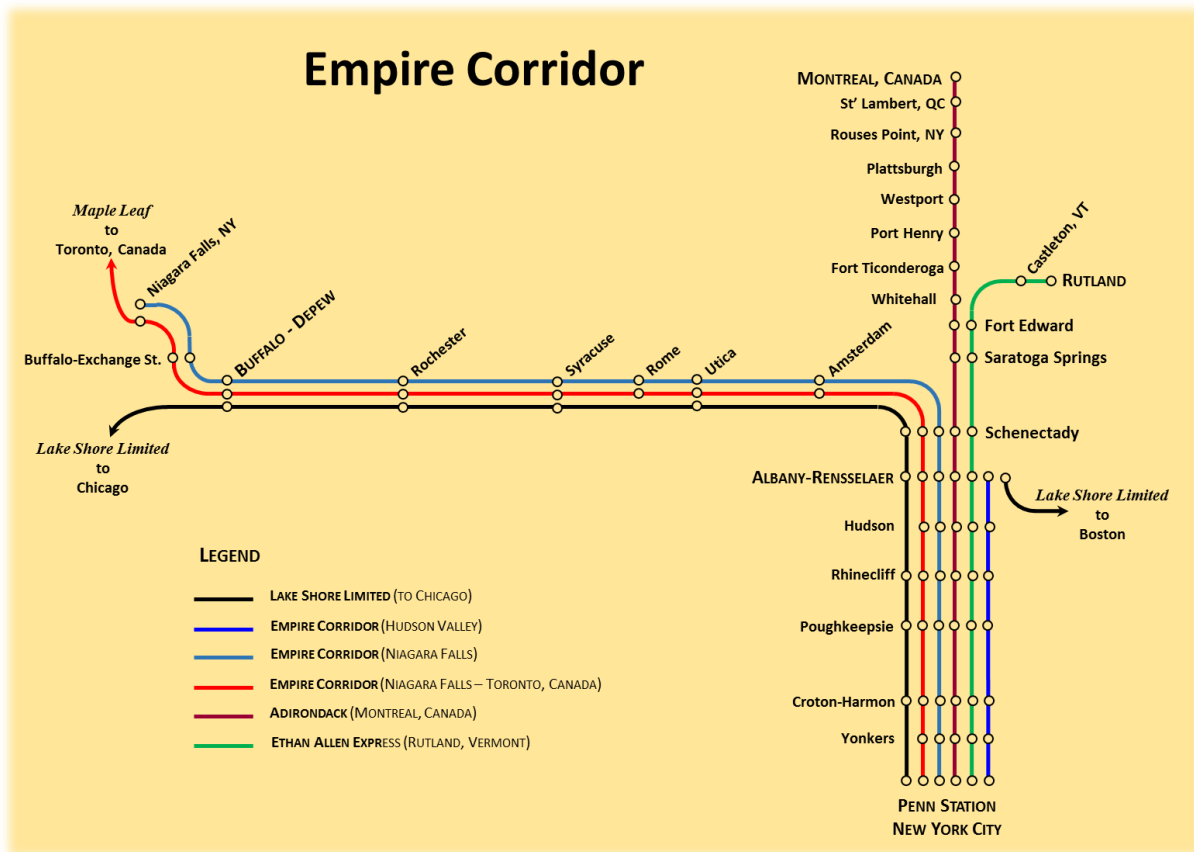

3.2.3 Air Network

Air service to Empire Corridor cities is available from New York City to Albany, Syracuse, Rochester, and Buffalo. Fares are significantly higher than those for either rail or bus, and airports require additional travel from central business districts by auto, bus, or ride-sharing services (taxi and Uber or Lyft-type services). There is currently no air service among the cities of Albany, Syracuse, Rochester, and Buffalo, as the trip distances are too short to justify air service, and flights cannot compete economically with available bus, rail, ride-sharing, auto and auto rental options.

3.2.4 Rail Network

NYSDOT contracts the operation of the Empire Corridor passenger rail service (Amtrak is the current operator). The route between New York City and Albany-Rensselaer, offering 13 daily round-trips, is the third busiest intercity rail route in the nation. The segment between Albany and Niagara Falls is owned by CSXT, a freight rail company, which allows Amtrak to run passenger service on shared tracks by contract with NYSDOT. The Empire Corridor is one of the primary freight routes between Boston and New York City, featuring favorable grades for train movements across the Appalachian Mountains to Buffalo, the Great Lakes, and to points in the Midwest and Chicago. Passenger trains serve the towns of Yonkers, Croton-Harmon, Poughkeepsie, Rhinecliff, and Hudson between New York City and Albany, and Amsterdam, Utica, Rome, Syracuse, Rochester, Buffalo, and Niagara Falls west of Albany. The rail network serving the Corridor is shown in Exhibit 3-1.

Exhibit 3-1 Intercity Rail Service Diagram for New York State

In addition to its primary New York City – Niagara Falls service, the Empire Corridor train system supports trains that travel beyond these boundaries. The Ethan Allen train runs northeast beyond Albany to Rutland, VT. Trains #63 and #64 (the “Maple Leaf”) are operated by VIA RAIL Canada from Niagara Falls, New York to Toronto, with U.S. and Canadian rail crews switching places at the border. Trains #68 and #69 (the “Adirondack”) are continuations of two Empire South trains that run north beyond Albany to Montreal, Canada, with the U.S. crews operating the trains over the entire route. The Lake Shore Limited runs west past Buffalo to Cleveland and Chicago, and east past Albany to Boston, Massachusetts. These services were included as part of the network simulation for the program, to ensure that the proposed train improvements are feasible, that the program can be delivered as intended, and that it will meet program objectives. These trains have also been recognized in discussions of ridership in the Tier 1 EIS and this SDP.

3.2.5 Rail Ridership Trends

The geographic distribution of ridership on the Empire Corridor is shown in Exhibit 3-2. The majority of the route's ridership is concentrated between NYC and Albany.

Exhibit 3-2 Empire Corridor Ridership by Segment

The route between Albany-Rensselaer and New York City is the third busiest rail route in the nation and is used by Empire Corridor trains as well as trains serving Montreal and Vermont. Ridership on the Empire Corridor has been growing steadily for the past decade, reaching 1.6 million passengers in 2016. As NYSDOT improves Empire Corridor infrastructure and services, Corridor ridership will continue to grow in response to faster trips and improved reliability.

4.0 ENVIRONMENTAL REVIEW PROCESS

To comply with the National Environmental Policy Act (NEPA), beginning in 2009, NYSDOT and FRA conducted a NEPA Scoping process and then developed a project Purpose and Need Statement and a series of higher-speed Empire Corridor rail alternatives that could provide improved Empire Corridor service, all documented in a Tier 1 Draft Environmental Impact Statement (Draft EIS circulated in 2014). The owners and operators of current freight and passenger rail services participated in the development of these alternatives in terms of operational feasibility and constructability. Subsequently, the impacts of these alternatives on local communities and the natural environment were assessed and compared, along with capital and annual operating and maintenance costs for each. Members of the general public, federal, state, and local agencies, and identified stakeholders (e.g., political jurisdictions, special purpose organizations, corridor owners and operators) were fully engaged in the development, assessment and comparison among these alternatives as members of the Empire (Corridor) Project Advisory Committee (EPAC). Four EPAC meetings were held during the Tier 1 Draft EIS process.

Formal public hearings were held in six cities across the state to explain the program and gather public input. Following the public hearings, a *Response to Comments* document was prepared. Finally, based on public comments received and the analytical findings, a **Preferred Alternative** (PA) was selected by NYSDOT. This PA is proposed in a Tier 1 Final Environmental Impact Statement (Final EIS) that is being published in parallel with this SDP.

The alternatives developed through the NEPA process were:

- **Base Alternative:** The slowest of the alternatives, the Base Alternative would constitute the current system improved through a series of basic upgrades that would be completed whether the Empire Corridor program advances or not. (Many of these have been completed at this writing; see Chapter 2 of this report.)
- **Alternative 90A:** This would involve a slight improvement over the Base Alternative, permitting some sections of the route to feature 90 miles per hour (mph) operation.
- **Alternative 90B:** This would involve a more significant improvement over the Base Alternative, permitting maximum speeds of 90 mph over a significant portion of the 464-mile route.
- **Alternative 110:** This would involve a modest improvement over the 90-mph Alternatives and permit some portions of the route to operate at 110 mph.
- **Alternative 125:** This alternative would involve an entirely new alignment designed for consistent 125 mph speeds.

Each of the alternatives were defined in terms of specific infrastructure and service improvements that would be made along the 464-mile Empire Corridor to achieve the higher speeds. These are described in the following section.

4.1 Base Alternative

The **Base Alternative** would maintain the current operating plan featuring thirteen round-trips between New York City and Albany-Rensselaer, with four trains continuing to Buffalo and three to Niagara Falls, in each direction. The **Base Alternative** comprises a series of supporting projects to improve the current level of service, including:

- Highway – Rail Grade Crossing Safety Improvements CSXT Hudson Line (MP75.8- 140): ES-1 (Completed)
- Improvements to the signal system and grade crossings between Poughkeepsie and Albany-Rensselaer: ES-3 (Completed)
- Installation of a second track from Albany to Schenectady: ES-10 (Completion in 2017)
- An additional fourth track in the Albany-Rensselaer Station: ES-9 (Completed)
- A complete renovation of the station building at Schenectady and other improvements: EW-01 (Construction Underway)
- Station improvements at Syracuse to reduce congestion between passenger and freight trains: EW-6 (Construction Underway)
- A new station building at Rochester: EW-19 (Completion in 2017)
- Niagara Falls Station – new intermodal Transportation Center: EW-13 (Completed)

4.2 Build Alternatives

All the **Build Alternatives** involve the addition of passing sidings and tracks, along with bridge replacements and station improvements. All require a replacement of the Livingston Avenue Moveable Bridge over the Hudson River between Rensselaer and Albany. The supporting projects for each of the **Build Alternatives** go beyond the initial improvements to be completed for the **Base Alternative**. These elements are shown in Exhibit 4-1.

Exhibit 4-1 Summary New/Improved Infrastructure needed for Alternatives¹⁵

Improvement/Addition	Alternative				
	Base	90A	90B	110	125
Miles of new mainline track	36	54	---	---	243 Double track
Miles of dedicated third track		10	283	283	10
Miles of dedicated fourth track		---	39	59	---
Miles of elevated track		---	---	---	56
Flyovers		3	2		---
Bridges (undergrade)	34	74	284*	284*	74*
Station Buildings	2	6	5	5	4
Station Facilities and Trackwork	4	6	11	11	9
Bridges (overhead)		90	90	---	---
Grade crossings	25	17	103	102	17

* Totals are for Empire Corridor West Only

4.2.1 Alternative 90A

Alternative 90A incorporates the **Base Alternative** projects and additional infrastructure improvements that reduce conflicts with freight services and improve reliability. This alternative will add 54 miles of track to the main line and 10 miles of additional third track in the Hudson Highlands (on right-of-way owned by Metro-North Railroad), and on right-of-way owned by CSXT between Amsterdam and Fonda, near Utica Station, at Syracuse and in the Rochester area. **Alternative 90A** is able to produce meaningful reductions in trip times by having trains bypass Rhinecliff and Hudson stations between New York City and Albany-Rensselaer, and Utica and Rome stations between Schenectady and Syracuse. As such, **Alternative 90A** offsets any gains in speed with losses of service to the less-heavily used stations. Further reductions in trip time would require additional track capacity that is not provided under this alternative to conserve cost. **Alternative 90A** permits 90 mph operation over significant portions of the Empire Corridor West right-of-way. The **Alternative 90A** includes the following infrastructure improvements:

- West Side Connection Spuyten Duyvil Second Track (MPs 9 to 13); SRP-1¹⁶
- Metro-North – Tarrytown; Pocket Track / Interlocking (MPs 23.8 to 25.0); SRP-2
- Metro-North New Signal System (CP 33 to CP 75) and (MPs 32.8 to 75.8); ES-12¹⁷
- Metro-North – New Third Track; (CP 53 to CP 63) and (MPs 53 to 63.5); SRP-3
- Metro-North Poughkeepsie Yard / Storage Facility Track / Signals (CP 71 to CP 75) (MPs 71 to 75.8); ES-13
- Rhinecliff Station Improvements (MP 89.2); SRP-11
- Hudson Line Reliability Improvements New Control Points; (CP 82, CP 99, CP 136) and (MPs 82 to 136); ES-05

¹⁵ High Speed Rail Empire Corridor Program, Tier 1 Draft EIS, Chapter 3: Exhibit 3-5; page 3-12

¹⁶ SRP means State Rail Plan.

¹⁷ ES means Empire Corridor South.

- Hudson Line Reliability Improvements Rock Slope Stabilization; (10 locations) (MPs 105.3 to 130); ES-04
- Hudson Station / Track Geometry Improvements (MPs 114.5 to 115); ES-14
- Livingston Avenue Bridge Replacement Project (MPs 143); ES-15
- Mohawk Subdivision – New Main Track (CP 169 to CP 179) (MPs 169 to 178.5); EW-14a¹⁸
- Mohawk Subdivision Congestion Relief (CP 175, CP 239 and CP 248) and (MPs 175 to 294); EW-05
- Amsterdam Station Improvements (MP 177.6); EIS-1¹⁹
- Belle Isle Capacity Improvements; (CP 290 to CP 293) and Syracuse Station Track Improvements; (MPs 290 to 294); EIS-6
- Rochester Subdivision - Reliability Third Main Track; (CP 373 to CP 382) and (MPs 373 to 382); EW-16
- Rochester Subdivision - Third Main Track; (MP 382 to 393); EW-20
- Buffalo Depew Station Improvements; (MPs 429.5 to 432.5); EIS-10
- Niagara Subdivision Double Track; (CP 17 to CP 22) and (MPs QDN17 to QDN23.8); EW-17
- Niagara Falls Maintenance Facility / Yard Improvements (MP QDN27); EW-18
- Niagara Falls Track Improvements; (MPs QDN25 to QDN28); EIS-12

4.2.2 Alternative 90B

Alternative 90B builds significantly upon the **Alternative 90A** and **Base Alternative** infrastructure improvements with a series of short- and long-range improvements, adding 283 miles of third track and 39 miles of fourth track to enable nearly complete separation of freight and passenger trains on reserved tracks.²⁰ Additional trains are added and serve all stations, producing meaningful trip time reductions. **Alternative 90B** allows 90 mph operation over most of the Empire Corridor West right-of-way. As Alternative 90B has been selected by NYSDOT as its **Preferred Alternative**, rather than list the supporting infrastructure improvements here, they have been organized into 20 segments (discussed in Section 7.0 of this SDP), to demonstrate detailed costing, phasing, and operational benefits over the 25-year life of the program.

4.2.3 Alternative 110

Alternative 110 builds on **Alternative 90B** and adds 20 miles of 4th track parallel to the existing freight tracks, providing a completely separate two-track passenger service and virtually eliminating any conflicts between passenger and freight trains between Albany and Niagara Falls. These improvements enable trains to attain a top speed of 110 mph, increasing average speeds

¹⁸ EW means Empire Corridor West.

¹⁹ EIS means High Speed Rail Empire Corridor Tier 1 Final EIS

²⁰ Freight and passenger trains can operate on non-designated tracks when necessary but would normally be confined to their designated track assignments.

over the corridor above what can be achieved with either **Alternative 90A** or **90B**. In considering **Alternative 110**, it is important to understand that CSXT, the owner of the right-of-way, requires for reasons of safety that the new 110-mph passenger train tracks be separated at least 30 feet from the existing freight tracks. In many places along the route, it is only possible to produce this separation by acquiring additional property beyond the existing footprint of the existing railroad right-of-way. In other places, even with the separate passenger tracks, it is not possible to achieve a 110-mph operation due to curves in the track alignment. Because of these encumbrances, **Alternative 110** produces its higher speed over a relatively small portion of the route. Because of the required property acquisition and the separation requirement, **Alternative 110** has higher costs than **Alternative 90B** while achieving only a modest improvement in overall performance.

4.2.4 Alternative 125

Alternative 125 would construct an entirely new two-track grade-separated electrified corridor (with overhead catenary wire for power delivery to the trains) between Albany and Buffalo dedicated to High Speed passenger rail service and would fall into FRA's "Core Express" category. While offering the highest operating speeds, **Alternative 125** requires significantly more property to enable the creation of an entirely new rail right-of-way apart from the existing CSXT freight/passenger right-of-way used under all other alternatives. Around Albany, Syracuse, Rochester, and Buffalo, the new corridor would roughly parallel the existing corridor on a combination of new and existing right-of-way to provide express service (15 round trips) to existing stations in these cities. The existing four daily round trips to Buffalo (of which three continue to Niagara Falls) would be maintained on the existing right-of-way. Between Albany and Buffalo, the new corridor would follow an alignment designed to balance the competing demands of operating speed, cost and environmental impacts. Along Empire Corridor West, existing service to all existing stations would be maintained, but express service along **Alternative 125** would only be provided to Albany-Rensselaer, Syracuse, Rochester, and Buffalo Exchange Street stations. **Alternative 125** would not include station improvements proposed for **Alternatives 90B** and **110** for Utica, Rome, Amsterdam and Schenectady. **Alternative 125** is far more costly than any of the other **Build Alternatives** (more than double the cost of **Alternative 90B**). Overall, **Alternative 125** requires the highest level of public investment with the longest lead time for achieving beneficial use. It was estimated that with the environmental review process, construction and funding requirements, **Alternative 125** would take 15 years before the first segment between Albany-Rensselaer and Syracuse could be completed and operational.

4.3 Preferred Alternative

From an evaluation of the benefits, costs and impacts of the alternatives, **Alternative 90B** was determined to be the best means of achieving the program objectives and meeting the purpose and need for the program. Implementation of **Alternative 90B** can be phased over time, in line with available funding, and produce measurable improvements in both speed and reliability as the program advances. Accordingly, **Alternative 90B** was selected as the **Preferred Alternative** for the program.

The SDP for the **Preferred Alternative** employs a strategy of phased expansion of service frequency on the Empire Capital District Connection portion of the Empire Corridor from the current 13 round-trips to a total of 17 round-trips per day by year 5 of a 25-year implementation schedule. Overall, by the end of the fifth year of the program, all Empire Capital District Connection trains will save 10-15 minutes from the current 2-½ hour trip time between Albany-

Rensselaer and New York City; trip time for selected express trains would be reduced to 2 hours. Key elements of the **Preferred Alternative** include projects to deliver 110 mph operating speeds in areas north of Poughkeepsie, along with strategic upgrades on Metro-North Railroad south of Poughkeepsie to increase operating flexibility. The Capital District Connection serves over 90 percent of the Empire Corridor's total ridership, and the **Preferred Alternative** would provide hourly service at key travel times during the day over this segment, ensuring that the line keeps pace with anticipated ridership growth.

For the Empire Corridor Gateway, service frequencies would be increased from four daily trains to eight within the first five years of program implementation. Further increases in speed and improvements in reliability would emerge gradually over the subsequent twenty years as track and signal improvements eliminate bottlenecks and increase train throughput capacity over critical sections.

5.0 SERVICE DEVELOPMENT PLAN

The SDP demonstrates the physical and operational feasibility of the Preferred Alternative. It amplifies and expands information contained in the Tier 1 EIS to establish practical schedules for construction of its separate elements (bridges, signals, switches, tracks) and for the introduction of expanded service as system capacity is increased. The SDP shows how system performance can be improved as funding is provided for specific improvements aimed at eliminating bottlenecks, increasing separation between freight and passenger services, and improving stations. The SDP engages train simulations and detailed operational modeling to establish specific train operating solutions that advance towards program goals and objectives, continually improving service and growing ridership. The following sections explain the detailed technical methodologies employed during development of the SDP.

5.1 Strategic Considerations

The SDP (see Exhibit 5-1) addresses specific strategic considerations and operating strategies that serve as program drivers.

Exhibit 5-1 Service Development Plan Factors

Strategic considerations include:

- A **Concept of Operations** defines how the intercity rail passenger service will operate to achieve program objectives.
- **Service Standards** set minimum levels of performance to be achieved through program implementation.
- Establishing an **Appearance of the Service**, creates a “brand” or distinctive visual signature by which travelers can recognize and develop loyalty to the service.
- Recognizing available **Operating Resources** (personnel) defines how the service can be upgraded in terms of labor rules and availability.
- The availability of **Operating Assistance** and **Investment Funding** for rolling stock and infrastructure improvements controls the pace at which infrastructure improvements can be implemented.

These elements are discussed in greater detail later in this section.

5.1.1 Concept of Operations

A Concept of Operations is developed by identifying deficiencies in existing services and establishing feasible changes to services that will achieve the program objectives.

The Concept of Operations provides the framework for the development of the train schedules, providing a general approach to:

- **Schedule Format** – consistent arrangement of departure times for trains; use of memory patterns, the extent to which trains depart at the same time each day.
- **Frequency of Service** – days of operations for the trains, and route segments being served.
- **Headways** – periods of the day, when it will be advantageous for trains to operate on hourly or uniform time spacing between trains.
- **Stopping Pattern** – stations that will be served by each train and determining the load factor that can be achieved by offering express or local trains.
- **Capacity** – determine the number of passenger coaches required to meet ridership goals and evaluate consist formulation and operability based on the schedule.

From the program's Concept of Operations, an operating timetable is developed with supporting train schedules and the necessary operating plans, including Train and Engine Crews Assignments and Equipment Utilizations necessary to operate the railroad.

Key goals of the **Concept of Operations** include:

- Provide the seat capacity to keep pace with **Ridership Growth**.
- Increase corridor **Mode Share**.
- Support corridor **Economic Growth** and revitalization.
- Realize **Environmental Benefits** due to the shift of travelers from more polluting travel modes to less polluting and more energy efficient rail services.

5.1.2 Service Standards

Standards for service development:

- Defines the composition of trains with coaches and Business Class to accommodate anticipated ridership demands;
- Identifies the service amenities to be offered to passengers including seats, luggage storage areas, seat lighting, availability of Wi-Fi and lavatory design;
- Establishes the criteria for trains being assigned Café Cars as a component of the strategy to demonstrate the superiority of intercity rail service to other travel modes; and
- Identifies amenities offered to passengers at each station, including ticketing, bicycle storage and baggage handling and storage, wi-fi, parking, and rental cars.

5.1.3 Appearance of the Service – “Branding” the Service

Create a strong service identity and visual brand for the service and initiate activities to develop a culture focused on customer satisfaction. Build brand awareness through the consistent application of visual elements such as an identifying logo, graphic standards, colors, and personnel uniforms.

5.1.4 Operating Resources

Determine the availability of operating resources with a focus on:

- Certifying the availability of **Route and Track Capacity** to support schedules and running times for the operating timetable developed from the Concept of Operations;
- Identifying the **Operational Capabilities** of the existing Infrastructure and deficiencies preventing support of the operating timetable developed from the Concept of Operations, and the improvements necessary to rectify them;
- Determining the ability of **shops and yards** to support the planned service, identify deficiencies, and the improvements necessary to rectify them;
- Using the Equipment Utilization Plan, evaluating the potential of the existing **Rolling Stock Fleet** to operate the planned service, and determining further equipment needs; and
- Securing the **commitment of the host railroads** along the route to partner with NYSDOT in supporting the planned operation and identifying factors that must be addressed to avoid interference with host railroad (CSXT/Metro-North) operations.

5.1.5 Operating Assistance and Investment Funding

The Empire Corridor Program is built around an expectation of \$240-\$250 million annually for capital project design and construction, of which 80% will be sought from federal sources, and the balance provided by local, state and private investments. To deliver this level of funding, the following sub-tasks will need to be managed:

- Work through the FRA grant process to identify and solicit federal funding;
- Work with municipalities to coordinate local station-area funding with ongoing Empire Corridor program activities;
- Provide for additional funding where necessary to support operations and maintenance costs;
- Explore and develop private-public partnership opportunities for selected program elements; and
- Secure federal eligibility through MPO and NEPA processes for Empire Corridor projects.

NYSDOT will develop and maintain a program project list from which to drive funding requests to the FRA and other potential funding sources. This list will be meshed with the state budget process to ensure state funding is available to match federal funds that may be secured.

5.2 Operating Strategies

Operating strategies define the level and quality of service NYSDOT will deliver through the Empire Corridor Program. Choices as to train service and passenger amenities will dictate service costs and funding needs. From the Concept of Operations, NYSDOT will define these service attributes as a framework within which to structure the improved services. By dimensioning these service qualities, NYSDOT will define a railroad improvement program in concert with capital construction of projects to eliminate sources of delay and speed train operations. Chapter 6 of this report lays out the specific operating specifications for the proposed service, demonstrates its operational feasibility, and identifies how these drivers will be shaped to ensure the service meets the program needs. Some of the key elements to be included in defining its operating strategy include:

- **Service Plan** – A service plan outlines how trains will operate over the route, which and in what way communities and stations will be served by the rail system, station attributes and amenities, incremental and overall staffing requirements, and the intended positioning of the rail service in the transportation market.
- **Schedule** – The schedule establishes a detailed timetable of train frequencies and trip times, express or skip-stop and local services, and other time-related considerations by which customers can understand their choices in using the service. Defining a schedule establishes the intensity of use of the equipment, crew requirements, yarding and maintenance cycles to be employed, and the implications for shop activities.
- **Crew Assignments** – Crew assignments respond to the Schedule to ensure adequate coverage of all personnel functions in accordance with the Service Plan. Crew assignments must accommodate contractual requirements among rail craft unions and/or of contracted operators and must respect FRA hours of service limitations and other regulatory obligations. Crews are primarily the train and engine crews who operate the trains, along with station personnel as required to address station operating and maintenance requirements, parking operations, baggage handling and storage, ticket sales, and general station facility management and upkeep.
- **Equipment Utilization** – This feature of the SDP prescribes how locomotives and rail coaches will be assigned to achieve the maximum number of trips and capacity using the available equipment fleet in line with operating rules and preventive maintenance requirements. Train consist requirements, yard requirements, and preventive maintenance requirements all determine equipment needs to achieve a specific schedule and type and level of services offered.
- **Amenities** – It will be necessary to define amenities that will be offered to passengers including food and beverage services, choices of seating and accommodations, Wi-Fi, and other services, potentially extending to porter services, bicycle storage and baggage handling in stations and on trains, the provision of wi-fi services on trains or in stations, café and/or meal cars, quiet cars, and other features designed to provide competitive, attractive, and appealing service that wins ridership loyalty.
- **Revenue Policy** – It will be necessary to establish revenue goals that align with desired ridership intentions while also addressing operating and maintenance costs.
- **Customer Service** – A customer service program can range from simple coverage of trains and stations for minimal customer support to an airline-level service orientation. The

decision how to structure the customer service aspects of the service drive certain cost elements that must be addressed in financial planning.

5.2.1 Operating and Financial Performance

This system of oversight and monitoring establishes the measures by which the effectiveness of the program will be tracked. On the basis of these metrics, program progress can be measured and synchronized with funding and other factors, including:

- local support for specific project initiatives;
- operator and owner ability to accommodate projects on the basis of normal preventive maintenance activities; and
- availability of sufficient work windows, technical support, Force Account capabilities, and other support needs by system owners.

Of specific concern is economic performance for the program. This performance can be evaluated through tracking of ridership and revenue compared to forecasts. Achieving ridership and revenue goals are important objectives; while infrastructure improvements are important, the service must attract additional ridership and gain revenue to be successful. While many metrics may be tracked in monitoring implementation progress, key performance objectives of ridership and revenue give the sharpest picture of success and provide critical guidance in shaping subsequent program investments year by year.

5.2.1.1 Ridership

The desired ridership growth must be supported by the capacity to accommodate the new passengers, if the service is to realize the revenue increases gained therefrom. While travel demand forecasts are driven by a combination of train frequency and travel time, it is difficult to assign proportions of riders responding to either or both service qualities. Using cost and travel-time elasticities derived from current travel behavior in the corridor, ridership projections were generated on the basis of specific increments of increasing speed and additional train frequency. Applying these elasticities to increments of travel time improvement and increasing train frequency permitted an estimation of increasing ridership as system service is improved. This forecast projected 1.083 million additional one-way trips over the entire Empire Corridor upon completion of all improvements and attainment of speed, travel time and reliability goals.²¹ This estimate can be tracked to assess how well investments – and the resulting improvements in speed and travel time – are driving ridership growth over time.

5.2.1.2 Revenue

To the extent that additional trains and faster service drive ridership growth, and providing fares are managed properly with respect to competing travel modes, the program can be expected to generate revenue growth in line with projections. It is forecast that the total rail patronage resulting from program implementation will generate \$143 million in annual fare revenues by 2035, of which

²¹ *High Speed Rail Empire Corridor Program, Tier 1 Draft Environmental Impact Statement, Chapter 5: Section 5.6, Exhibit 5-13*

\$62 million would be due to new ridership.²² Using a method similar to that employed to estimate future ridership, it is possible to monitor incremental revenue increases as the program is implemented and adjust program implementation plans as necessary.

²² *High Speed Rail Empire Corridor Program, Tier 1 Draft Environmental Impact Statement, Chapter 5: Section 5.6, Exhibit 5-13*

6.0 SERVICE AND OPERATING PLAN FOR EMPIRE CORRIDOR PREFERRED ALTERNATIVE

The Service and Operating Plan demonstrates through simulation and analytics that the Preferred Alternative is operationally feasible, from the standpoint of train movements, crewing, equipment utilization and cycling, and passenger handling/management.

Beginning with the existing operation, the Service Plan offers specific data in terms of additional train service, coordinated movement of anticipated freight and proposed passenger train operations, stationing, platforming and dwell times, and yard and shop cycles to demonstrate how the service would work, at what cost, and with what revenue.

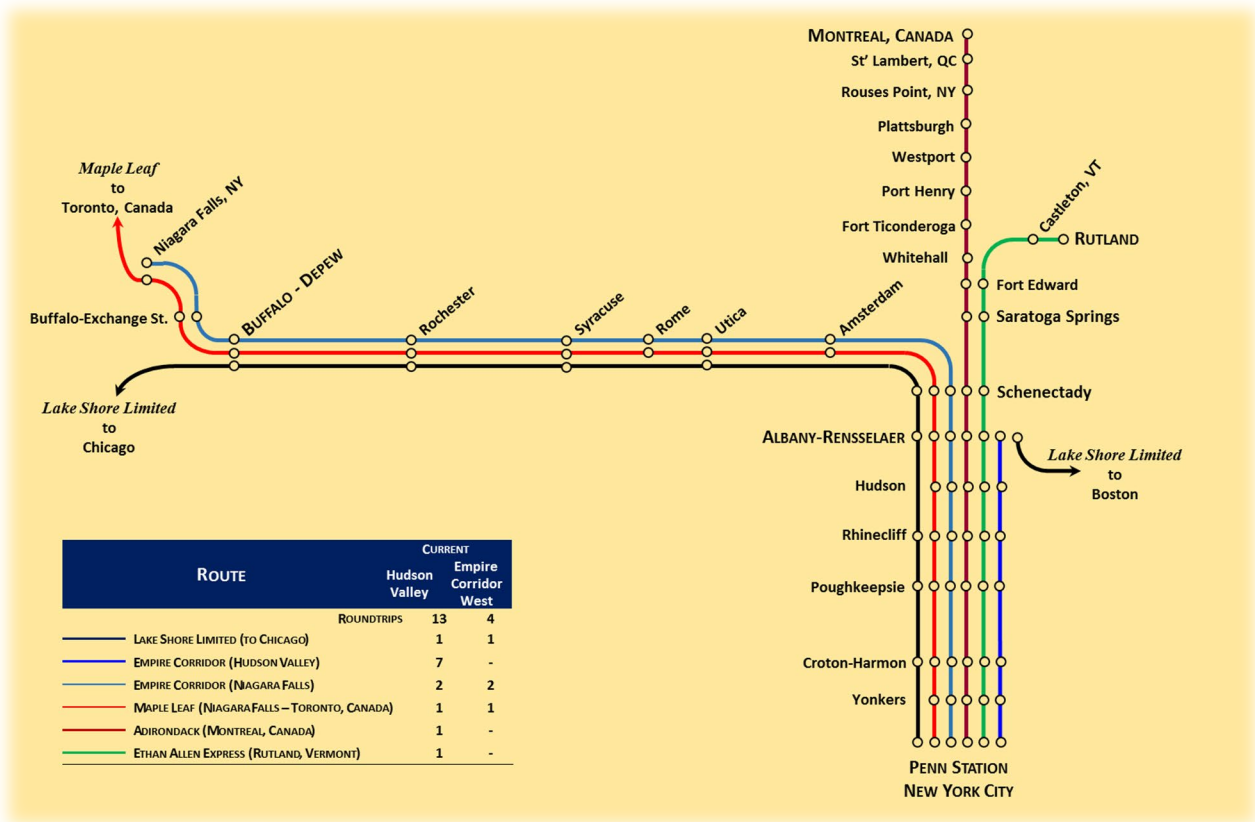

6.1 Existing Train Operation

Currently, the intercity rail passenger service is composed of a main trunk extending from New York City to Albany. At Albany-Rensselaer certain trains terminate their runs while other trains continue (or originate from Albany) to Rutland, Vermont; Montreal and Toronto, Canada; and Buffalo and Niagara Falls. From Buffalo, some “Lake Shore” trains continue to Chicago and points north and west. Exhibit 6-1 shows the distribution of trains and routes that make up the Empire Corridor.

6.2 Proposed Train Operation

The Preferred Alternative changes existing train service on both the Empire Corridor South and the Empire Corridor West segments, with its primary focus on additional service and meaningful trip time reductions. The major change is to add within the first five years of the program 4 daily round trip trains between New York City and Niagara Falls, increasing train service on the Empire Corridor South segment from 13 to 17 daily round trips, and on the Empire Corridor West segment from four to eight daily round trips. An associated goal of this additional service and the accompanying infrastructure improvements is to speed service and eliminate track bottlenecks on Empire Corridor South. This will enable a two-hour express service for certain trains operating between Albany-Rensselaer and New York City (the two-hour threshold is an important perceptual consideration in attracting travelers to this line). Supporting projects focus on upgrading portions of the line between Poughkeepsie and Albany-Rensselaer to 110 mph operation.

Exhibit 6-1 Empire Corridor and Distribution of Intercity Passenger Services

2 CITIES
IN
2 HOURS™

Other Empire Corridor South trains will see up to a 15-minute travel time reduction between New York City and Albany during the first five years, while the travel time for Empire Corridor West trains between Albany and Niagara Falls will shrink from 6 hours to 4-3/4 hours, a reduction of one hour and fifteen minutes. Additionally,

over the 25-year implementation time frame, the entire corridor will see an improvement in on-time performance from the current 80% or less to an anticipated 95.4%, due to the additional capacity allowing trains to pass each other rather than follow in sequence.

Operational improvements under the **Preferred Alternative** include:

- Increasing the number of round-trips between New York City and Albany-Rensselaer from the current 13 round-trips to 17 round-trips
- Increasing the number of round-trips on the Empire Corridor West to Niagara Falls from the current 4 round-trips to 8 round-trips
- Operating certain trains with a 2-hour trip time between Albany-Rensselaer and New York City. All other Empire Corridor South trains will achieve a 15-minute trip time reduction as part of an overall trip time reduction of 90 minutes over the entire run from Niagara Falls to Penn Station New York City. Trains from Empire Corridor West operating through Albany and into the Hudson Valley will be able to achieve greater trip time reductions, at least 75 minutes and potentially somewhat more.

- Improving reliability with an on-time performance target of 95.4 % by the time the program is complete, with significant improvements above current levels as program elements are constructed and bottlenecks and choke points eliminated.

6.3 Concept of Operations

In developing the train schedule for the **Preferred Alternative**, key factors are targeted in the Concept of Operations (numbered below and designated with the prefix, “C”):

- C-1** Achieve a 90-minute trip time reduction for trains operating between New York City and Niagara Falls;
- C-2** Achieve a 15-minute trip time reduction for trains operating between New York City and Albany-Rensselaer;
- C-3** Achieve a 2-hour trip time for designated trains in the Hudson Valley using the 110 miles per hour infrastructure that is part of the Empire Capital District Connection program;
- C-4** Operate an earlier morning train to Albany from New York City to arrive at 9:00 a.m., with a corresponding later evening return trip;
- C-5** Establish all-day hourly service between New York City and Albany;
- C-6** Inaugurate hourly service during mornings and afternoons from Schenectady as part of the completion of the Albany-Rensselaer to Schenectady Double Track Project;
- C-7** Introduce two new morning trains with returning afternoon trains serving Saratoga Springs as part of the Empire Capital District Connection;
- C-8** Operate trains on two-hour headway during daytime hours from Syracuse;
- C-9** Assign equipment to provide nine trains on the western portion of the corridor from Albany-Rensselaer; and
- C-10** Introduce a new morning departure that originates in Albany for Buffalo and Niagara Falls with a later afternoon return trip. This targets an important niche in the transportation market for the Empire Corridor not served by airlines.

6.4 Track Configuration and Operation Modeling

The track arrangements with notations of improvements in speeds for the High Speed Rail Empire Corridor Program EIS are included as Appendix B.

6.4.1 No-Build Track Configuration

The program must begin with the current infrastructure as it is improved with the projects outlined in the **Base Alternative**. As noted in Section 4.1, these include some recent improvements sponsored (and, in some cases, already completed or in currently construction) by NYSDOT.

NYSDOT has supported other improvements in the Hudson Valley (Empire Corridor South) that improve service reliability through installation of a new direct buried signal and communication cable as well as with extensive tie and rail renewal and roadbed surfacing, new grade crossing warning apparatus, and continual upgrading of the signal system. These conditions constitute the

pre-implementation condition and establish the base condition upon which the **Preferred Alternative** will further improve service capabilities and train operating capacity and speed.

6.4.2 Preferred Alternative Track Configuration

Supporting projects of the **Preferred Alternative** focus on upgrading portions of the line between Poughkeepsie and Albany-Rensselaer to 110 mph operation, where they are currently limited by geometry and/or signal controls to 80 mph.

The track configuration required for the **Preferred Alternative** is shown in Volume 2 of the High Speed Rail Empire Corridor Program EIS and is included for reference as Appendix B to this SDP. The required supporting infrastructure improvements for Empire Corridor South, as part of the Empire Capital District Connection, are outlined in Exhibit 6-2.

Exhibit 6-2 Empire Corridor South Infrastructure Improvements

Improvement	Addition
Total Miles of Additional New Track	22
Miles of New Third Track	19
Miles of New Fourth Track	3
Miles of Upgraded Track to 110 mph	108
Miles of Upgraded Track to 90 mph	3
New Interlockings	6
Miles of Upgraded Signal System	67
New High Level Station Platforms	2
Upgraded Bridges	10
Miles of Fence Improvements	42

The required supporting infrastructure improvements for Empire Corridor West are outlined in Exhibit 6-3.

Exhibit 6-3 Empire Corridor West Infrastructure Improvements

Improvement	Addition
Total Miles of Additional New Track	322
Miles of dedicated third track	283
Miles of dedicated fourth track	39
Flyovers	3
Bridges (undergrade)	284
Station Buildings	5
Station Facilities and Trackwork	11
Bridges (overhead)	90
Grade crossings	103

A further explanation of infrastructure improvements and implementation strategy is discussed in Chapter 7, Program Implementation.

6.5 Operations Simulation Modeling

To demonstrate operational feasibility for the **Preferred Alternative**, a series of network models were developed using Berkeley Simulations – Rail Traffic Controller, and the results are listed in Appendix D – Rail Network Simulation Report in Volume 3 of the High Speed Rail Empire Corridor Tier 1 EIS. They demonstrate a largely conflict-free operation with a high degree of schedule reliability upon completion of all program track, signal, bridge, and station initiatives contained in the Preferred Alternative.

6.5.1 Methodology

The methodology for developing the Operations Simulation models followed industry practices to produce data and reports that would support the development of the operating schedules and programs for the expanded passenger rail service, integrated with existing freight rail services. Deliverables from the Operation Simulation modeling for the **Base** and four **Build Alternatives** included:

- Train Performance Calculations
- Time + Distance (Stringlines)

Information from CSXT, Amtrak and MNR, including Employee Timetables, Operating Rule Books, Track Charts and Diagrams and Signal Control Line Drawings were used to develop a network model of the existing infrastructure that formed the foundation for the Base Alternative. Working from this Base Alternative scenario, modifications were made to the simulation model to represent additional tracks and switches that would enable greater operational flexibility between tracks, to support the operating requirements and characteristics for each Build Alternative. A test case was conducted using the Base Alternative model and the results validated to calibrate the model. The model was then used to develop the outputs used to develop schedules. Time + Distance Charts were then developed to identify any constraints in the operating plan and potential conflicts so corrections could be made to avoid any future challenges in operating the service for this alternative. Additional simulations and analysis were performed to determine any impacts on freight train operations and the determination of possible On Time Performance.

6.5.2 Results/Model Outputs: Preferred Alternative Operating Plan

Further results with supporting schedules for the **Base** and four **Build Alternatives** are included in Appendix D of Volume 3 of the High Speed Rail Empire Corridor Program Tier 1 Final EIS.

6.5.2.1 Time + Distance Charts

The supporting **Time + Distance Charts (Stringlines)** are included in Exhibit 6-4 for both east and westbound trains. These charts demonstrate the capacity of the improved Empire Corridor to accommodate the planned passenger and freight traffic in 2035 at the intended speeds of operation and headways. As such, the charts demonstrate that the system will run conflict-free under normal operating conditions.

6.6 Operating Program

The operating program for the Preferred Alternative is built from the Concept of Operations, as shown in Exhibit 6-5. It addresses the detailed requirements for overall system operations, including Crew Assignments, Schedules, Train Cycling Requirements and Equipment Utilization, and Terminal and Yarding Plans. These are described below.

Exhibit 6-5 Operating Program Components

6.6.1 Timetables

The timetable for the Preferred Alternative was built from the existing service on the Empire Corridor and was designed to incorporate the key improvements outlined in the Concept of Operations. These trains are numbered below as even (eastbound or southbound) and odd (westbound or northbound) and designated with the prefix 'C' (relating to NYSDOT's project management system), as follows:

C-1 Trains #'s: - 63, 273, 281, 283, 285, 287, 275 and 64, 270, 280, 282, 284, 286, 274

90-minute overall trip time reduction for trains operating between New York City and Niagara Falls

C-2 Schedule adjusted for all trains in the Hudson Valley, to achieve trip time reduction

15-minute trip time reduction for most trains operating between New York City and Albany-Rensselaer

C-3 Trains #'s – 273, 283, 234, 284 (NYC-Albany)

2-hour trip time for certain trains in the Hudson Valley, taking full advantage of the 110 miles per hour infrastructure that is part of the Empire Capital District Connection program.

C-4 Trains #'s - 231 and 272

Operate an earlier morning train to Albany from New York City to arrive by 9:00 a.m., with a corresponding later evening return trip.

C-5 Hourly service pattern established at Albany-Rensselaer from 5:00 AM to 8:00 PM with 18 departures and hourly service pattern from New York City from 6:15 AM to 7:00 PM with 16 departures; with two late evening trains to balance service with 18 trains in each direction.

Establish hourly service between New York City and Albany

C-6 Hourly service from Schenectady to Niagara Falls from 6:30 AM to 11:25 AM with 6 departures, and 7 arrivals from Niagara Falls to Schenectady from 4:50 pm to 8:50 pm.

Inaugurate hourly service from Schenectady during mornings and afternoons, as part of the completion of the Albany-Rensselaer to Schenectady Double Track Project

C-7 Trains #'s - 234, 238 and 237, 239

Introduce two new morning trains with returning afternoon trains serving Saratoga Springs as part of the Empire Capital District Connection.

C-8 Bi-hourly service pattern established with expanded fleet of locomotives and coaches

Operate trains on two-hour headway during daytime hours from Syracuse to New York City

C-9 Service pattern established

Assign equipment to provide nine trains on the western portion of the corridor from Albany-Rensselaer

C-10 Trains #'s – 271 and 274

Introduce a new morning departure originating in Albany for Buffalo and Niagara Falls, with later afternoon return trip. Designed to target important niche in the transportation market for the Empire Corridor that is not served by commercial airlines.

6.6.2 Schedules

The operating schedules are shown in Exhibits 6-6 and 6-7, and were developed to meet the following criteria:

- Meet the program goals for trip time reductions and expanded frequency of service.
- Achieve a 7 hour and 36-minute run time from Niagara Falls to New York City.
- Introduce trip time savings between Albany-Rensselaer and New York City.
- Maximize equipment and crew utilizations by introducing Syracuse as an intermediate terminal. The 4 hour and 50-minute run time from Syracuse to New York City is competitive with air service to mid-town Manhattan and has the capacity and trip time savings to attract passengers from airlines and from their automobiles, supporting program goals.

New: Albany-Rensselaer - New York City (Penn Station)

New: Western Empire Corridor

6.6.3 Equipment

Consists

Currently all Empire Corridor trains operate with a fixed assignment of equipment, with all trains consisting of:

- 1 – Locomotive: Genesis P32AC-DM (required for operation Albany-Rensselaer to New York City)
- 4 – Amfleet I Capstone Standard Coaches
- 1 – Club / Dinette (Café Car with Business Class Section)

Additional coaches may cycle on certain trains between New York City and Albany-Rensselaer, based on availability for maintenance and repair.

A 15-minute station dwell time is included in most westbound schedules of Empire Corridor at Albany-Rensselaer for fueling or locomotive changes.

Assigning trains so that the line runs with all trains having the same number of coaches in the future will streamline the car assignment process of coaches to trains, favorably impacting operations in several ways:

- Less yard activity making up trains; lower personnel-count for operation.
- Simpler preventive maintenance routines based on predictable and standard cycling of equipment.

Equipment Utilization

Equipment utilization diagrams are shown for the current assignment in Exhibits 6-8 and 6-9, outlining the equipment assignments for the **Preferred Alternative**.

PAGE INTENTIONALLY BLANK

Exhibit 6-8 Current Equipment Utilization Assignments

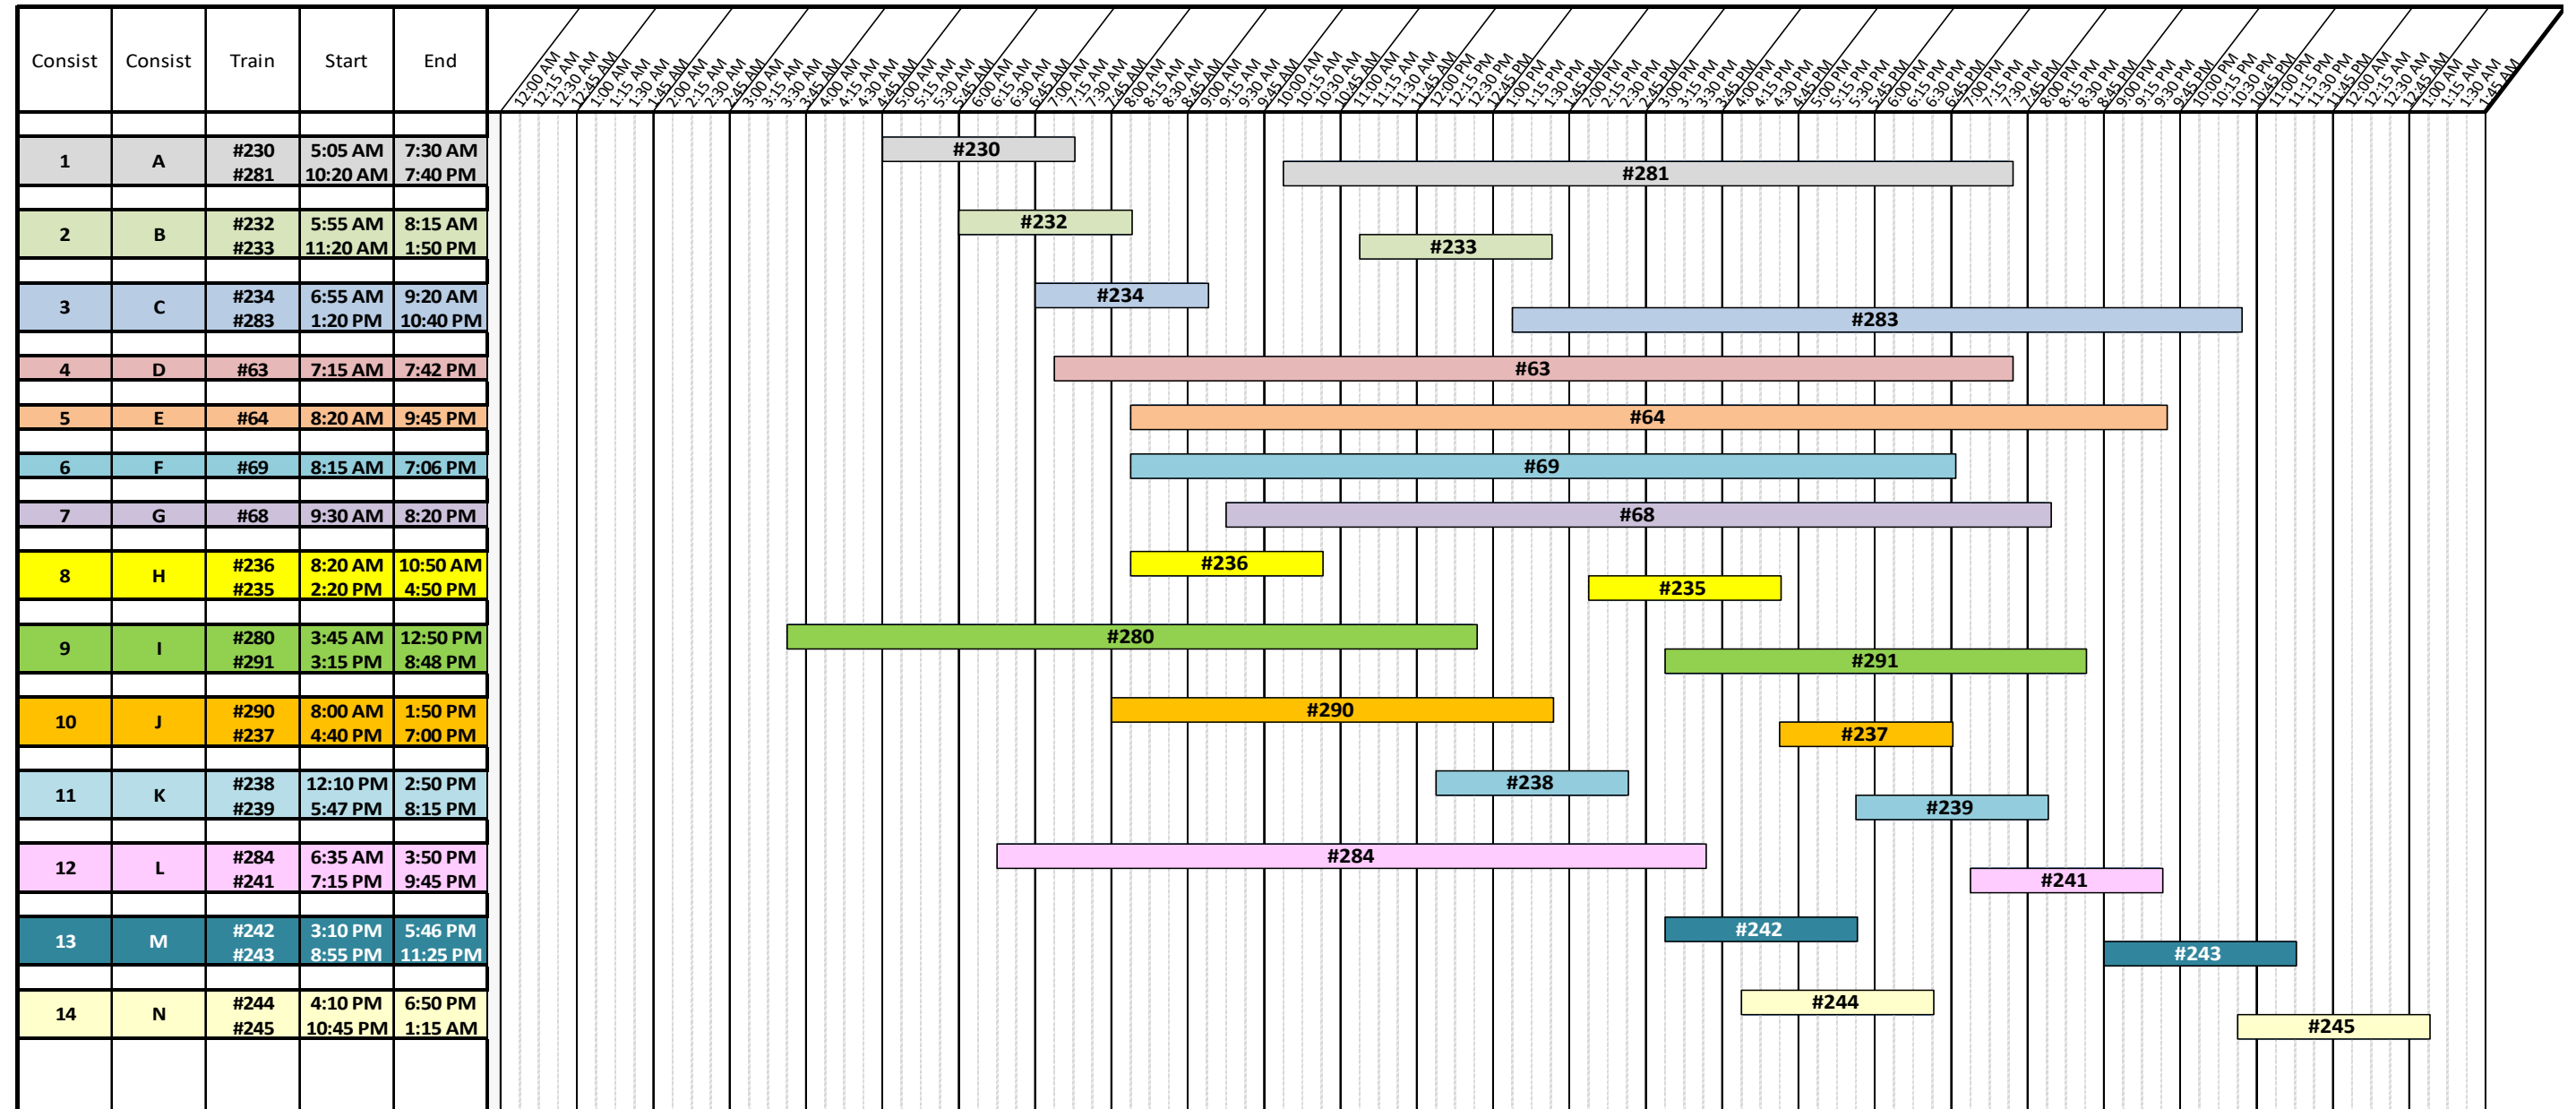

Exhibit 6-9 Preferred Alternative Equipment Utilization Assignments

6.6.4 Train Crew Scheduling

Train and Engine (T&E) crew assignments for the Empire Corridor are largely made from a central control point with crews based from a home terminal or central location at Albany-Rensselaer. Basing the crews at Albany-Rensselaer provides the greatest efficiency in optimizing crew time for trips and the maintenance of crew “extra” lists (personnel available to fill in for workers who call in sick or take vacation). Working from this central location also enables crews to become cross-qualified between the different service segments west and south of Albany, maximizing the availability of employees with fewer constraints for assignments.

Crew assignments are established with the process outlined in Exhibit 6-10, Days of Operation, for each service are given in Exhibit 6-11.

Exhibit 6-10 Days of Operation

The process starts with the determination of a run, a train schedule, and identification of the T&E crews required to operate all the trains for that schedule. Runs are then organized into round-trip couplets against which train crews are assigned by day of the week, thus allowing crews to return to their points of origin at the ends of their shifts. These assignments also recognize designated crew relief days. The couplets on the Empire Corridor are organized by route (Ethan Allen, Lake Shore Limited, Montreal runs, Niagara Falls trains).

Factors that come into play in organizing the crew couplets are:

- Organized within the parameters of the existing labor agreements;
- Consistent with the Federal “Railroad Hours of Service Law;”
- Couplets are organized for outlying terminals “first-in & first-out” to minimize total hours on duty for crews;
- The assignments are organized for gaining future crew hour efficiencies between Albany-Rensselaer and Niagara Falls or Niagara Falls, Ontario; and
- The crew couplets integrate the increased service with existing trains to maximize crew efficiencies. New trains are shown in **BLUE BOLD** in the crew couplet tables.

On the Empire Corridor, the crew couplets are organized as shown in Exhibit 6-12 into five patterns, and are listed in Exhibit 6-13:

- Hudson Valley (Albany-Rensselaer to New York City)
- Ethan Allen Express (Albany-Rensselaer to Rutland, Vermont and Return)

- Adirondack (Albany-Rensselaer to Montreal, Quebec, and Return)
- Empire Corridor West (Albany-Rensselaer to Niagara Falls, NY or Ontario and Return)
- Lake Shore Limited (Albany-Rensselaer to Buffalo-Depew and Return)

Exhibit 6-12 Crew Couplet Districts

In the future, further crew efficiencies may be able to be gained by reexamining the initial terminal for some of the Empire Corridor West T&E crews by expanding the Buffalo/Niagara Falls crew start location.²³

6.6.5 Terminal, Yard and Support Operations

Equipment disposition programs are included for Empire Corridor Terminals and Yards. New trains are shown in **BLUE BOLD**, Exhibits 6-14 and 6-15.²⁴

²³ As more trains operate to/from Niagara Falls, it will be necessary to have spare or relief T/E personnel at that location. Currently the main location for T/E crew extra lists is at Albany-Rensselaer. The length of the run from Albany-Rensselaer to Niagara Falls requires that relief crews be available at Niagara to comply with Hours of Service rules. It is not practicable nor do the Union Collective Bargaining agreements allow for shifting employees randomly; they must be permanently assigned to one location or the other.

²⁴ "EQ" in Exhibits 6-14 and 6-15 means "equipment" (locomotives and coaches).

6.7 Stations

In recent years, NYSDOT has had an active improvement program upgrading, modernizing, and replacing passenger stations along the Empire Corridor. A summary of station improvements is included on the following Exhibits 6-16 and 6-17.

Exhibit 6-16 Empire Corridor West – Station Improvements

Empire Corridor West	
City	Status
Amsterdam	Station relocation to the central business district and modernization study is underway sponsored by NYSDOT.
Utica	Constructed westbound platform with improvements to station parking.
Rome	Completed improvements to provide better access to station platforms.
Syracuse	Constructed Intermodal Facility and NYSDOT is currently supporting an analysis to reduce congestion for freight and rail passenger service in the Syracuse Terminal area of the CSXT – Syracuse Terminal. Completed planning improvements for the station stop at the New York State Fairgrounds.
Rochester	Completion is nearing for a new station building with a high-level center platform, and an expanded facility for passenger train operations.
Buffalo–Depew	NYSDOT completed parking and other passenger amenities improvements.
Buffalo–Exchange Street	NYSDOT is working with the City of Buffalo and other stakeholders to plan a new station that will provide better connections to the local transit system and support downtown economic growth.
Niagara Falls, NY	Completed a new intermodal facility that provides the International crossing staffed by the Department of Homeland Security. This allows significant reduction in the schedule time for trains crossing the border from Canada, improving both overall run times and service reliability.

Exhibit 6-17 Empire Corridor South – Station Improvements

Empire Corridor South (Hudson Valley / Empire Capital District Connection)	
City	Status
Saratoga Springs	NYSDOT remodeled the station in 2004.
Schenectady	NYSDOT sponsored construction of a new station is underway with completion expected in 2018.
Albany–Rensselaer	NYSDOT recently completed: <ul style="list-style-type: none"> • Installation of a fourth station track • Platforms lengthened to accommodate 10 car trains
Hudson	High-level platforms and accessibility improvements will be part of the Empire Capital District Connection program.
Rhinecliff	High-level platforms and accessibility improvements will be part of the Empire Capital District Connection program.
Poughkeepsie	MNR modernized and restored the station.
Croton–Harmon	MNR modernized the station.
Yonkers	MNR modernized the station.
New York City	The “Moynihan Station” project, currently underway, is supported by NYSDOT and other stakeholders, to transform the former Farley Post Office Building on 8th Avenue. It will provide a new entrance and passenger amenities and increases station capacity for both intercity and commuter trains.

6.7.1 Station and Access Analysis

The following section includes a summary of the accessibility features included at each of the Empire Corridor West and South stations, Exhibits 6-18 and 6-19.

Exhibit 6-18 Empire Corridor West – Station Access

Empire Corridor West	
City	Access
Amsterdam	Low Level Platform with Wheelchair Lift is available.
Utica	2 - Low Level Platforms with Wheelchair Lifts are available for east and westbound tracks.
Rome	Center Island Low Level Platform with Wheelchair Lifts are available for both tracks, with elevator access to the platform.
Syracuse	High level platform with completely barrier free access for Americans with Disabilities Act (ADA) accessibility.
Rochester	New station will feature center-island platform that will provide for a barrier-free ADA accessible facility.
Buffalo–Depew	The station currently has a low-level platform with wheelchair lift available, and a station parking area has been designated with parking spaces for drivers with “handicap” placards and ramps from the parking area to station boarding platforms.
Buffalo–Exchange Street	Station currently has a low-level platform with Wheelchair Lift available.
Niagara Falls, NY	New station features a barrier-free high-level platform providing an ADA-accessible facility.

Exhibit 6-19 Empire Corridor South – Station Access

Empire Corridor South (Hudson Valley / Empire Capital District Connection)	
City	Access
Saratoga Springs	Low Level Platform with Wheelchair Lift is available.
Schenectady	There will be a new low level platform with two platform edges. A wheelchair lift is available. The new platform will also have a redundant egress.
Albany–Rensselaer	High-Level platforms accommodating all tracks with elevators in station completely barrier free for ADA accessibility.
Hudson	Low-Level Platform with Wheelchair Lift is available.
Rhinecliff	Low-Level Platform with Wheelchair Lift is available.
Poughkeepsie	High-Level platforms accommodating all tracks and a station that is completely barrier free for ADA accessibility.
Croton–Harmon	High-Level platforms accommodating all tracks and a station that is completely barrier free for ADA accessibility.
Yonkers	High-Level Platforms accommodating all tracks and a station that is completely barrier free for ADA accessibility.
New York City	High-Level platforms accommodating all tracks and a station that is completely barrier free for ADA accessibility.

6.7.2 Station Location Analysis

Station locations and parking facilities are provided in Exhibits 6-20 and 6-21.

Exhibit 6-20 Empire Corridor West – Station Location

Empire Corridor West		
City	Address	Parking
Amsterdam	466 West Main Street Route 5 West Amsterdam, NY 12010	3 Short Term Parking Spaces 13 Long Term Parking Spaces
Utica	321 Main Street Boehlert Transportation Center Utica, NY 13501	200 Long Term Parking Spaces
Rome	6599 Martin Street Rome, NY 13440	5 Long Term Parking Spaces
Syracuse	1 Walsh Circle Regional Transportation Center Syracuse, NY 13208	266 Long Term Parking Spaces
Rochester	320 Central Avenue Rochester, NY 14605	40 Long Term Parking Spaces
Buffalo–Depew	55 Dick Road Depew, NY 14043	40 Short Term Parking Spaces 40 Long Term Parking Spaces
Buffalo–Exchange Street	75 Exchange Street Buffalo, NY 14203	10 Short Term Parking Spaces 10 Long Term Parking Spaces
Niagara Falls, NY	825 Depot Avenue West Niagara Falls, NY 14305	30 Short Term Parking Spaces 30 Long Term Parking Spaces

Exhibit 6-21 Empire Corridor South – Station Location

Empire Corridor South (Hudson Valley / Empire Capital District Connection)		
City	Address	Parking
Saratoga Springs	26 Station Lane Saratoga Springs, NY 12866	40 Short Term Parking Spaces 40 Long Term Parking Spaces
Schenectady	332 Erie Boulevard Schenectady, NY 12305	Currently No Short Term Parking Spaces 20 Long Term Parking Spaces ²⁵
Albany–Rensselaer	525 East Street Rensselaer, NY 12144	500 Short Term Parking Spaces 500 Long Term Parking Spaces
Hudson	69 South Front Street Hudson, NY 12534	35 Short Term Parking Spaces 150 Long Term Parking Spaces
Rhinecliff	455 Rhinecliff Road Rhinecliff, NY 12574	42 Short Term Parking Spaces 141 Long Term Parking Spaces
Poughkeepsie	41 Main Street Metro-North Station Poughkeepsie, NY 12601	10 Short Term Parking Spaces 50 Long Term Parking Spaces
Croton–Harmon	4 Veteran's Plaza and 1 Croton Point Avenue Croton-on-Hudson, NY 10520	1,903 Short Term Parking Spaces 600 Long Term Parking Spaces
Yonkers	5 Buena Vista Avenue Metro-North Station Yonkers, NY 10701	250 Long Term Parking Spaces
New York City	8th Avenue and West 31st Street Pennsylvania Station New York, NY 10001	Privately operated parking garages available near station on 31 st Street

²⁵ Station currently under construction; final parking values still to be determined.

6.7.3 Station Operations

Station operational conditions and ownership characteristics are provided in Exhibits 6-22 and 6-23.

Exhibit 6-22 Empire Corridor West – Station Operations

Empire Corridor West		
City	Staff	Remarks
Amsterdam	Caretaker	Study currently underway to relocate the station closer to central business district.
Utica	Staffed	Facility Ownership: County of Oneida Parking Lot Ownership: County of Oneida
Rome	Unstaffed	Owned by the City of Rome.
Syracuse	Staffed	Facility Ownership: Intermodal Transportation Center, Inc. Parking Lot Ownership: Intermodal Transportation Center, Inc. (Central New York Transportation Authority–CENTRO)
Rochester	Staffed	Currently being replaced with new facility to open in 2017.
Buffalo–Depew	Staffed	Facility Ownership: State of New York Parking Lot Ownership: State of New York
Buffalo–Exchange Street	Staffed	Facility Ownership: City of Buffalo Parking Lot Ownership: City of Buffalo
Niagara Falls, NY	Staffed	Facility Ownership: City of Niagara Falls Parking Lot Ownership: City of Niagara Falls

Exhibit 6-23 Empire Corridor South– Station Operations

Empire Corridor South (Hudson Valley / Empire Capital District Connection)		
City	Staff	Remarks
Saratoga Springs	Staffed	Facility Ownership: Canadian Pacific Railway Parking Lot Ownership: Canadian Pacific Railway
Schenectady	Staffed	NYSDOT is currently building a new facility.
Albany–Rensselaer	Staffed	Facility Ownership: Capital District Transportation Authority Parking Lot Ownership: Capital District Transportation Authority
Hudson	Staffed	Facility Ownership: National Railroad Passenger Corporation Parking Lot Ownership: Amtrak, City of Hudson
Rhinecliff	Staffed	Facility Ownership: Dutchess County Parking Lot Ownership: Dutchess County/CSXT
Poughkeepsie	Staffed	Station Operated by: Metro-North MNR Facility Ownership: Metro-North MNR Parking Lot Ownership: Metro-North MNR
Croton–Harmon	Staffed	Station Operated by: Metro-North MNR Facility Ownership: Metro-North MNR Parking Lot Ownership: Metro-North MNR
Yonkers	Staffed	Station Operated by: Metro-North MNR Facility Ownership: Metro-North MNR Parking Lot Ownership: Metro-North MNR
New York City	Staffed	Facility Ownership: National Railroad Passenger Corporation

6.7.4 Intermodal Connectivity

The current intermodal connectivity options found at each station are listed in Exhibits 6-24 and 6-25.

Exhibit 6-24 Empire Corridor West – Intermodal Connections

Empire Corridor West	
City	Remarks
Amsterdam	Local Bus Connections provided by: City of Amsterdam Transit System
Utica	Local Bus Connections provided by: Utica – CENTRO (Central New York Regional Transportation Authority) Station served by: Adirondack Scenic Railroad, Greyhound, Adirondack Trailways, Birnie Bus Service
Rome	Local Bus Connections provided by: Rome - Oneida – CENTRO (Central New York Regional Transportation Authority)
Syracuse	Local Bus Connections provided by: CENTRO (Central New York Regional Transportation Authority) Station served by: Greyhound, New York Trailways
Rochester	Local Bus Connections provided by: RTS - Regional Transit Services The Rochester-Genesee Regional Transportation Authority (RGRTA)
Buffalo–Depew	Local Bus Connections provided by: NFTA - METRO Niagara Frontier Transportation Authority (NFTA)
Buffalo–Exchange Street	Local Bus Connections provided by: NFTA - METRO Niagara Frontier Transportation Authority (NFTA)
Niagara Falls, NY	Local Bus Connections provided by: NFTA - METRO Niagara Frontier Transportation Authority (NFTA)

Exhibit 6-25 Empire Corridor South – Intermodal Connections

Empire Corridor South (Hudson Valley / Empire Capital District Connection)	
City	Remarks
Saratoga Springs	Local Bus Connections provided by: Capital District Transportation Authority
Schenectady	Local Bus Connections provided by: Capital District Transportation Authority
Albany - Rensselaer	Local Bus Connections provided by: Capital District Transportation Authority
Hudson	Local Bus Connections provided by: Columbia County Public Transit
Rhinecliff	Taxi service available at station
Poughkeepsie	Local Bus Connections provided by: Dutchess County Public Transit (Division of Public Transit)
Croton-Harmon	Local Bus Connections provided by: Westchester Transportation County; Bee-Line Bus
Yonkers	Local Bus Connections provided by: Westchester Transportation County; Bee-Line Bus
New York City	Multiple Routes and Services Operated by Amtrak NJ Transit, MTA New York City Transit

6.8 Operating Results

Monitoring the operational performance of the service will focus on:

- On Time Performance
- Customer Satisfaction
- Financial Results
- Cost Recovery
- Operating Statistics
- Safety

- Market Share

The performance measurements will be part of a continuing process of identifying trends and determining actions that may need to be taken to ensure that the service is meeting the program goals.

6.8.1 On Time Performance

For many passengers, On Time Performance is the basis for measuring the entire trip experience. On Time Performance will be analyzed by both the performance across:

- All Trains Operating on the Route
- Individual Trains

The monitoring system will employ a matrix by which to analyze location and causes of delay:

- Railroads Providing Trackage and Dispatching
- Full Route
- Segment
- Types of Delays

6.8.2 Customer Satisfaction

Measures of customer satisfaction will employ a yardstick based on performance and surveys. The process will result in the creation of a Customer Service Index (CSI). Program managers will routinely cross reference the intangible and tangible attributes of the service to measure customer perception and value of the service. A Customer Comment Matrix will be used to record customer comments as to service quality; these will be applied to the CSI and measured against ridership to determine if service/performance is affecting ridership and to address significant weaknesses. The program management team will also undertake routine Service Standard Audits to compare service delivery against standards in particular performance areas and to gauge whether improvements are warranted.

6.8.3 Financial Results

Financial results will be tracked using two metrics:

- Cost Recovery
 - Revenue
 - Analyzing Fixed, Incremental and Variable Costs
 - Profit / Loss statement

- Operating Statistics (Costs and Revenues)
 - Ridership (Seat Miles Created and Utilized, Load Factor, Passenger Miles, Trip Length, Seat Turnover)
 - Mechanical Integrity (Equipment Availability, Mean Time Between Failures, Failure Analysis)
 - Train Operation (Train Miles, Locomotive Miles, Coach Miles, Matrix against Operating Segment)

6.8.4 Safety

The program team will develop an assessment process for safety focusing on:

- Employees – days without injuries; injury/train-mile
- Passengers – injuries/train-mile
- Trespassers – non-fatal injuries; fatal injuries; causes of injury

The process will apply the results to create a process of continual improvement.

6.8.5 Market Share

An annual assessment of market position based on regional and corridor data will help program managers determine further actions to improve service and attract riders. This process will require monitoring of other transportation modes to recognize changes to:

- Service Frequency and Amenity
- Schedules, Speed, Trip Times, and Fares/Costs
- New Initiatives – Capacity Improvements

7.0 PRIORITIZED CAPITAL PROGRAM OF PROJECTS – IMPLEMENTATION STRATEGY

The High Speed Rail Empire Corridor Program will build on recent and current projects sponsored by NYSDOT. Infrastructure improvements to date have included new stations, upgraded tracks and expanded capacity along the route from New York City to Niagara Falls. In the future, the capital program will focus on improvements that are coupled to increases in service frequency, shorter trip times, and increased operating capacity. By prioritizing projects to maximize benefits to operations, the program will advance towards its objectives in the most direct manner, driving public support for further investments as the benefits of the improvements are experienced by travelers.

The program implementation strategy has thus been designed to optimize the relationship between funding/spending and accrued benefits. Investments are sequenced to give the greatest travel time and operational benefits in the earliest phases, while ensuring minimum interference with live freight and passenger operations. The program has a 25-year life-span primarily to align with anticipated funding; based on past recent history and anticipated funding programs, it is expected that an annual program of \$250 million is affordable and manageable in the context of existing and anticipated future freight and passenger operations.²⁶ The program will need to be reassessed periodically, as each phase of work is completed, metrics are assessed, and future operating constraints are better known (level of freight traffic, evolving safety requirements, evolving travel demands).

The overall program is estimated to cost \$7.323 billion (2017 dollars). Although the Tier 1 Final EIS for this program indicates a capital cost over 20 years of just under \$6 billion, as this program was developed in more detail for this SDP, it was realized that the most efficient approach to rail infrastructure upgrades on an increasingly heavily used operating line is to visit each repair location once, and to upgrade to a state of good repair all elements at that location, even if they are not directly related to program objectives. Thus, if the program seeks the realignment and upgrade of a single track over a three-track bridge, it makes sense for both reasons of efficiency and reasons of collateral benefit to the service to upgrade the other two tracks as well. This avoids the need to return sometime later to address the other two tracks and, more importantly, leaves CSXT as the operator with greater flexibility to dispatch freight and passenger trains such that the passenger trains can still operate at the allowable speed, regardless to which track they are assigned. This improved dispatch and operational flexibility gives much greater likelihood of consistent, reliable, High Speed passenger service regardless of the freight traffic running in parallel. This decision increases the program cost, by bringing the entire freight/passenger network up to higher speed track standards.

The following sections detail the specific waves of program improvements, their cost, and the reason for the sequence of projects.

7.1 Capital Program - State of Good Repair

In recent years, NYSDOT has sponsored a series of infrastructure improvements along the Empire Corridor, outlined in Exhibit 7-1. These improvements constitute the Base condition and

²⁶ Projects are selected based on maximum passenger benefit and by geographic segment to minimize the impact of construction on railroad operations. This produces slight fluctuations in total annual costs around the \$250m annual target.

set the stage for significant additional ridership growth as Alternative 90B projects are implemented in coming years.

Exhibit 7-1 Recent Projects Sponsored by New York State – Department of Transportation

Project Name (Milepost)	ARRA Grant Application	Project Description	Project Status
ES-1	Highway-Rail Grade Crossings Safety Improvements CSXT Hudson Line (MP 75.8 to 140)	Design and install grade crossing active warning device, roadway approach and/or pedestrian improvements to accommodate improved passenger rail operations between Poughkeepsie and Albany-Rensselaer.	Completed
ES-3	Hudson Subdivision Signal Reliability (MP 75.8 to 140)	Replace old signal poles (for electric power to signals and communication lines) with underground cable between Poughkeepsie and Rensselaer Station.	Completed
ES-9	Albany-Rensselaer Station Fourth Track Capacity Improvements (MP 141 to 143)	Add a fourth track and extend platform to increase station capacity, operating speeds, train frequency, and routing flexibility, and reduce delays.	Completed
ES-10	Albany-Schenectady Double Track (MP 143.2 to 160.3)	Design, construct and rehabilitate a second main track between the Rensselaer and Schenectady stations to increase capacity, eliminate a bottleneck, and improve operations along a congested single-track segment.	Completed
EW-01	Schenectady Station Renovation / Platform Improvements (MP 159.8)	Complete station reconstruction, ADA compliant platform and station access, viaduct repairs, and parking improvements.	Under Construction
EW-6	Syracuse Track Configuration and Signal Improvements (MP 287 to 291)	Upgrade existing third track to reduce congestion, delays and interference between passenger and freight trains.	Under Design
EW-19	Rochester Station Redevelopment / Operating Improvements (MP 368 to 373)	New station building with new high-level center island platforms, new tracks/siding/interlocking to improve train operation efficiency, reduce congestion and improve passenger safety.	Completed
EW-13	Niagara Falls Station – New Intermodal Transportation Center (MP QDN28.2)	New station with improved location in downtown Niagara Falls, for improved function, operation, connectivity, border security, and reduced delays.	Completed

7.2 Summary of Implementation Strategy

The **Preferred Alternative** aims to increase service frequency, speed, and reliability for intercity passenger trains, without interfering with freight rail operations. Projects are aligned with anticipated funding and are sequenced to minimize impacts of construction on daily operations while yielding the greatest ridership and operational benefits. Key milestones in implementing this program include:

- Acquisition of new locomotives and passenger coaches

- Creation of additional capacity on the route through track, signal, and switch improvements
- Reconfiguration
- Increased train speeds and reduced trip times by flattening curves

The improvements intended for Empire Corridor South will be completed in the first five years of the twenty-five-year implementation schedule. These receive first priority in the program as they do not engage CSXT freight operations, and they address the largest ridership component on the Corridor. Empire Corridor South improvements also affect nearly two thirds of total Corridor travelers who travel between New York City and Albany and provide benefits to Empire Corridor West travelers who either originate in or are destined to Empire Corridor South stations. Finally, success on Empire Corridor South is expected to create support for continuing the program west of Albany in subsequent years.

Similar improvements for Empire Corridor West will be introduced gradually over the following twenty years on a priority basis keyed to ridership levels. Exhibit 7-2 illustrates the supporting infrastructure improvements intended for Empire Corridor West, organized into twenty segments. Each of the segments can be built independently, minimizing the impact on existing CSXT operations. As each segment is completed, Albany – Buffalo/Niagara Falls trip times and congestion will be reduced.

Exhibit 7-2 Empire Corridor and Distribution of Intercity Passenger Services

7.2.1 Summary of Service Growth

Additional trains would be added to the Empire Corridor schedule as outlined in Exhibit 7-3.

Note A: Trip will be extended from Syracuse to Niagara Falls in Year 25.

7.3 Short Term Capital Plan (0 – 5 years)

Years 1-5 focus on Empire Corridor South between New York City and Albany and are aimed at capacity and speed. These projects are anticipated to result in approximately a 15-minute savings in travel time between NYC and Albany, reducing a 150-minute trip to a scheduled 135-minute trip, and elevating average speeds from 64 mph to 70 mph over this segment. Starting the

program improvements between Albany-Rensselaer and New York City will provide benefits to large numbers of passengers who traverse both the Empire Capital District Connection (Empire Corridor South) and the Empire Gateway section (Empire Corridor West). Sections of the right-of-way now limited to 80 mph would be improved to permit 90 mph and 110 mph operation, and some track constraints would be removed to enable overtaking where current operations require following at slower speed. By reducing conflicts at compromised track locations, it is anticipated that these projects will improve on-time performance (OTP) from slightly below 80% to 85% of trains arriving on time. Approximately \$1.2 billion is programmed for the Empire Corridor South Year 1-5 improvements.

In addition to these speed and capacity infrastructure improvements, the first five years of the program will involve the addition of four round-trip trains (and a fifth additional one-way trip to Syracuse) to the Empire Corridor, with the additional train runs terminating further and further west as infrastructure improvements can be completed to support the extended operation. To enable the additional trains, approximately \$200 million worth of locomotives and coaches will be added to the fleet, sufficient to create six full train sets (five operating trains; one in for repairs and upkeep on a rotating, preventive maintenance cycle). Two trains will operate as limited-stop expresses, servicing certain stations to deliver a two-hour travel time between NYC and Albany.

The program implementation strategy for the first 5-year period is outlined in Exhibits 7-4 and 7-5.

7.4 Mid Term Capital Plan (6 – 10 years)

Years 6-10 of the program focus on select bridge replacements, track and signal improvements between Albany and Niagara Falls. Approximately \$1.2 billion will be spent during this phase, or \$240 million annually. These improvements address speed and capacity and are distributed along the Empire Corridor West right-of-way to avoid a circumstance where overly concentrated construction activity in one area might interfere with freight or passenger services. The next phase of the work starts at Utica Station, as this will provide the most immediate operational flexibility and capacity increase for the system. With an expanded interlocking west of the station, the program enables increased platform and track capacity where it is most needed to accommodate planned train moves. The program will then continue expanding capacity to the east and west from Utica Station, focused on conflict-free meets (passing of one train by another) of east and westbound trains on separate or passing tracks. Beyond Utica Station, the Niagara Falls branch single track chokepoint is addressed to enable two-way operation that better accommodates the increased service resulting from Years 1-5 and saves significant time in the schedule (which cascades back through the entire Corridor including trains on Empire Corridor South). These projects will reduce Albany-Niagara Falls travel times by 10 minutes for all trains and significantly improve reliability, increasing on-time performance from 78% to 87%, reducing delays, and yielding more consistent and dependable service. As program improvements provide additional capacity to the west, the four trains added to the schedule in Years 1-5 would be extended to Rochester, then Buffalo/Depew, and, finally, to Niagara Falls. The program implementation strategy for Years 6 through 10 are outlined in Exhibit 7-5.

PAGE INTENTIONALLY BLANK

7.5 Extended Term Capital Plan (11 years and beyond)

The program implementation strategy for Years 11 through 25 are outlined in Exhibits 7-6, 7-7, and 7-8. The subsequent program work is concentrated almost entirely on Empire Corridor West, and continues the effort to decongest the track system, relieve bottlenecks (in descending order of impact), speed train operations by smoothing curves, increase platform flexibility at stations through the addition of track interlockings, and upgrade elements of passengers' experience. These projects complete the program with additional track and signal system improvements to further speed train operations, reduce freight/passenger conflicts, improve reliability, and reduce delays. It remains essential to complete the entire program, since the failure to complete improvements on the Empire Corridor West segment would result in slower schedules that would cascade along both Empire Corridor West and Empire Corridor South operations, limiting the benefits of the earlier investments in these more heavily traveled Corridor segments.

PAGE INTENTIONALLY BLANK

7.6 Staffing Plan for Supporting Service Growth

Based on the foregoing summaries of the program capacity improvement sequence over the 25-year implementation period and noting the introduction of expanded frequency of service in the first five years, crewing and staffing of rail operator forces to sustain the enhanced physical plant and additional train service is outlined in Exhibits 7-9 through 7-14. Additional trains are added in early program phases because ridership on the Empire Corridor between Albany and New York City is reaching saturation, and studies show that adding service to crowded transit services is necessary to maintain existing ridership while positioning the service to accommodate growth.

8.0 PROGRAM IMPLEMENTATION STRATEGY

The program implementation strategy has been designed to optimize the relationship between funding and accrued benefits. Investments are sequenced to give the greatest travel time and operational benefits in the earliest phases, while ensuring minimum interference with freight operations over the life of the program. The program has a 25-year life-span both to align with anticipated funding and to enable projects to be sequenced to avoid impacts to existing freight and passenger services. The latter stages of the program will need to be reassessed as early work is completed, metrics are assessed, and future operating constraints are better known (level of freight traffic, evolving safety requirements, evolving travel demands, etc.). This section of the SDP describes the administrative, financial, legal, and managerial infrastructure that must be in place to support program implementation.

8.1 Financial Plan – 10 years

Funding the initial 10-year program phase is limited to available Federal and State capital funding (plus the possibility of modest municipal investments for station-related improvements). An annual target of \$250 million has been established for the program to address anticipated rates of federal support and to ensure that infrastructure work is not undertaken at a level that might interfere with daily passenger and freight services.²⁷ Based on project schedules and the capacity of the existing rail network to tolerate track, signal and station work, it is expected that this level of investment would continue for the duration of the program, providing funding can be identified and programmed.

8.1.1 Revenue

By increasing speed, train frequency, and reliability, the program will draw riders to rail from other modes, primarily airlines, intercity bus, and automobiles. Travel demand forecasting conducted during the NEPA process indicated a potential shift of approximately one million new riders by 2035, increasing ridership from its current level of 1.6 million annual riders to 2.6 million annual riders.²⁸ While it is difficult to project fares over the implementation time frame, using current (2017) fares, 2035 revenues would be expected to increase from \$79 million to approximately \$143 million by 2035 due to increased ridership, an increase of \$64 million (2017 dollars).

8.1.2 Cost

The program operating and capital costs are discussed below. Operating and maintenance costs grow as program elements are implemented (both capital infrastructure improvements and additional train service). Capital costs of \$7.323 billion (2017 dollars) are spread over the entire 25-year implementation time frame for the program. Equipment costs amount to approximately \$200 million, with infrastructure improvements costing \$7.123 billion.

²⁷ Projects are selected based on maximum passenger benefit and by geographic segment to minimize the impact of construction on railroad operations. This produces slight fluctuations in total annual costs around the \$250 million annual target.

²⁸ This SDP recognizes additional travel time benefit of 4 minutes that was not considered in the Tier 1 EIS, resulting in a slightly larger ridership gain of 1.083 million new riders by 2040.

8.1.3 Train Operations

The program will increase total round train trips from four to eight between New York City and Buffalo/Depew-Niagara Falls. (One additional train will operate between Albany-Syracuse on a loop basis.) The total Train and Engine additional complement would be expected to be 40 personnel once all five trains have been added. This includes all service requirements and extra-list additional staffing.

8.1.4 Maintenance

Costs will increase due to the need for additional train crews and station, track and signal maintenance personnel associated with the improvements. By the time the program is completed in 2045, it is estimated that the additional trains and improved and expanded track and signal system will require approximately 141 additional train, station, and track/signal maintenance personnel above current allocations.

8.1.5 Total Operating and Maintenance Costs

Overall, including train crews and track/signal/station maintenance and operating personnel, the **Preferred Alternative** will add \$70 million to the base Empire Corridor operating cost of \$106 million (2017 dollars) by 2035. The annual Empire Corridor operating and maintenance costs would then total \$176 million.

8.1.6 Deficits

Including all infrastructure and train operations and infrastructure maintenance costs, implementation of the **Preferred Alternative** will result in an increase in the Empire Corridor deficit of about \$6 million, from \$27 million to \$33 million (2017 dollars).

8.2 Capital Cost

The program is structured to require approximately \$250 million annually for capital investment (Exhibit 8-1).²⁹ The first five years emphasize Capital Empire District (Empire Corridor South) infrastructure and additional train equipment, with the balance beyond Year 5 focused on the Empire Gateway (Empire Corridor West) Albany – Buffalo/Niagara Falls right-of-way. Capital costs are divided generally by type of improvement as shown in Exhibit 8-2.

²⁹ *The first year shows a reduced program value recognizing administrative planning and organization, and initial contractor mobilization, resulting in a lower spending level Year 1.*

Exhibit 8-1 Annual Apportionment of Total Program Capital Costs (Empire Capital District Connection and Empire Corridor Gateway)

Empire Corridor Capital Program Annual Budget			
Year	Empire Capital District Connection	Empire Gateway	Total Program
1	\$214		\$214
2	\$257		\$257
3	\$250		\$250
4	\$255		\$255
5	\$47	\$200	\$247
6		\$260	\$260
7		\$265	\$265

20		\$350	\$350
21		\$325	\$325
22		\$375	\$375
23		\$375	\$375
24		\$325	\$325
25		\$235	\$235
Total	\$1,023	\$6,300	\$7,323

Exhibit 8-2 Capital Costs by Category

Item	EC South (millions \$)	EC West (millions \$)	Total (millions \$)
Bridges	\$310		\$310
New Tracks/Passing Sidings	\$147		\$147
Curve Straightening	\$220		\$220
Signal System Upgrades	\$79		\$79
Rolling Stock	\$200		\$200
Station Upgrades	\$67		\$67
High Speed Rail Construction (track, signals, sidings)		\$6,300	\$6,300
Total	\$1,023	\$6,300	\$7,323

The program will cost about \$7.323 billion over 25 years (2017 dollars). About \$2.4 billion will be required in the first ten years, with the balance over the remaining fifteen years. Exhibits 7-4 - 7-8 show the allocation of costs across the 35 separate program initiatives that comprise the program, as well as year-by-year over the 25-year investment period.

Funding for the program is expected from ticket sales, lease and concession revenues, and federal and state grants. Operating costs will be funded from ticket sales and station concession lease revenues and state funds. Capital funds will be generated from federal (likely FRA) and state budgets via NYSDOT and appropriations, and some municipal contributions toward station or station area improvements. Under the Passenger Rail Investment and Improvement Act of 2008, states are obligated to share the capital costs of improvements and daily operating and maintenance costs of services provided by Amtrak over portions of the Northeast Corridor and its branches. For the Empire Corridor, NYSDOT will share both the capital and operating and maintenance costs of the program according to formulas based on shared benefits and intensity of use of the infrastructure by the parties.

8.3 Capital Program

NYSDOT maintains a State Rail Plan that is developed by NYSDOT and processed through the various Metropolitan Planning Organizations and Regional Transportation Districts (RTDs) that represent political jurisdictions through which the Empire Corridor passes. The NYSDOT program provides a framework for repair and expansion of the state's road and rail networks. Projects are incorporated into the program and then approved by the appropriate MPO to ensure eligibility for federal funding. Some projects are funded entirely with state funds, although most are funded with a mix of state and federal funds, matched with local municipal or RTD funds where appropriate.

8.4 Program Management Plan and Schedule

The program will be managed according to a Program Management Plan, incorporating a schedule by which the various program elements will be implemented and laying out the procedures by which the program will be implemented. The Plan will span program organization and staffing, procurement procedures, design procedures, federal and state compliance procedures, notification procedures, required agreements and permits, utility management plans, and all other facets of standard project management. The schedule will integrate CSXT, MNR and Amtrak daily train operating requirements, notification requirements, and ongoing system maintenance needs with program design, procurement, construction, and testing/commissioning requirements to ensure routine operations are unaffected by program activities. Individual projects will be sequenced to maintain all essential rail and local road and emergency response operations and to optimize construction and minimize costs for flagging, Force Account, local police/traffic/utility, and other support services. The Program Management Plan will be written and submitted upon approval of the first federal grant for the program.

8.5 Institutional Arrangements and Organizational Responsibilities

The Program Management Plan will identify the right-of-way and asset owners and other parties responsible for program implementation. Owners of right-of-way include Amtrak, MNR and CSXT. NYSDOT will serve as the Program Manager, with responsibility for securing all necessary agreements and NEPA findings for specific projects, coordinating with the owners for access to and occupation of the right-of-way, and scheduling and monitoring the conduct of the work at a high level. The individual projects will be constructed by the owners or contractors working under their supervision. Testing and commissioning will be performed by the owners and Amtrak. NYSDOT will serve as the recipient of federal funding and will maintain program budgets.

8.6 Stakeholder Agreements

8.6.1 Program Sponsor Agreements

NYSDOT is the sole program sponsor. However, NYSDOT will require support from – and will need to coordinate with – MNR, Amtrak, and CSXT. How these agreements will be structured will be a function of negotiations to clearly identify roles and responsibilities, program schedule requirements, cost allocation, and trackage rights agreements. Separate agreements will be required with each operator, except for areas of the program where more than two parties must cooperate to effectuate the improvements. It is also possible that NYSDOT will need to execute agreements with other governmental units, such as the State Historic Preservation Office, or municipalities where local funds are to be provided or where municipal station work needs to be coordinated with other program improvements.

8.6.2 Railroad Agreements

Railroad operating agreements are required to define track sharing/occupancy arrangements, dispatching responsibilities and protocols, and vehicle, station, and track/signal infrastructure obligations. Canadian Pacific Rail and Norfolk Southern have trackage rights agreements and may have to be engaged for formal agreements regarding their service requirements.

8.7 Other Responsibilities

As program sponsor, NYSDOT will also be responsible for securing any necessary federal or state permits and approvals, for securing property, for managing municipal and stakeholder engagement, and for interfacing with FRA. NYSDOT also has responsibility for developing and securing agreements, funding and guiding design, coordinating with municipalities around station area plans and improvements and intermodal services at stations, and contracting with MNR, Amtrak and CSXT for the required switch, track and signal work. NYSDOT must also complete all required NEPA documentation and secure all required NEPA findings, and secure state and federal environmental permits. NYSDOT will also set minimum standards for customer service, contract the operation of the Empire Corridor passenger services, and monitor program metrics to ensure ridership growth and related financial conditions track against expectations.

9.0 ASSESSMENT OF BENEFITS

Investment in intercity passenger rail and high speed rail is motivated by the desire to realize direct passenger benefits associated with faster, safer, and more reliable travel, and broader-based community benefits of improved environmental quality, reduced air and highway congestion, and economic development. Passenger rail improvements create economic impacts in the form of travel time savings for rail users, reduced congestion on other transportation modes, and regional productivity increases from more efficient access to larger labor and trade markets. These savings cascade through the economy, creating jobs, increasing overall activity, and raising personal income.

The direct benefits of a transportation improvement typically involve measures of improved travel service: time savings due to faster travel and/or greater reliability that reduces delay for travelers on the trains. Indirect benefits flow from regional productivity improvements due to greater efficiency in moving people and the economic ripple effects of higher spending levels on enhanced service.

For the High Speed Rail Empire Corridor Program, the direct benefits are a 94-minute reduction of overall travel time from 9 to 7.5 hours between NYC and Niagara Falls, and an increase in reliability from fewer than 75% to more than 90% of trains arriving on time. Of the 94 minutes of travel time savings, 80 minutes occurs along the Empire Corridor West segment between Albany and Niagara Falls. This is significant, as this section is most affected by freight conflicts and unreliability; in 2012, the “average delay” penalty assigned in the travel demand forecasting model was 90 minutes, with the great majority allocated to the Empire Corridor West section. Thus, the program will provide direct quantifiable benefits where the current service is most needing.

Indirect benefits of the program are improved environmental conditions (air quality, open land), reduced traffic congestion on key roads, the enhancement of rail stations as economic engines for downtown areas, and the freeing of airline capacity for longer-range travel that cannot be effectively served by rail.

The program costs are as specified in previous chapters. The program will cost \$7.323 billion (2017 dollars) to construct over 25 years, with improved travel time and reduced delay benefits accruing gradually as improvements are made. The maintenance and operation of the new infrastructure and the additional four daily trains intended to be added to the existing service will cost \$70 million annually at the completion of the program in 2040.

The benefits specific to the different segments of the Empire Corridor are described below, and these are summarized in a series of quantitative metrics for the program overall in Section 9.3.

9.1 Benefits Empire Corridor South

9.1.1 Travel Benefits (Direct Benefits)

- **Trip Time Reduction:** The 2-hour trip time target represents a 30-minute savings for passengers between Albany and New York City. The 30-minute trip time reduction will be accrued incrementally as the supporting projects are completed. This reduction benefits 90% of the ridership on the Empire Corridor.

- **Increase Frequency:** Train frequencies increase in early program phases, providing hourly service during peak periods. The number of round-trips New York City - Albany will grow from the current 13 to 17 roundtrips.
- **Direct Travel Cost Savings:** Passenger ridership forecasts for High Speed Rail Empire Corridor Program project ridership increasing to 2.7 million riders in 2040. It is estimated that over \$14 million in reduced travel costs would be saved by travelers shifting to rail for its higher speed, reduced trip times, and more reliable performance.
- **Improving On-Time Performance and Reliability:** The additional tracks support improvements in OTP and reliability. It is anticipated that a reliability of 95.4% can be achieved, compared to the current value below 80%.

9.1.2 Non-Travel (Indirect) Benefits

- **Environmental Impacts:** All improvements are within the existing right-of-way, resulting in minimal environmental impacts. Some projects contained in the program will require more focused environmental analysis before they can be built.
- **Employment and Jobs:** Operation of trains at higher speeds between Albany-Rensselaer and New York City creates opportunities for “super-commuters” to live and work from greater distances away from job centers while enjoying shorter commuting time and expanded employment opportunities. Employers gain the benefit of drawing upon a larger geographic area for a trained and skilled labor force.
- **Gradual and Continuing Improvement:** For Empire Corridor South, trip time reductions and service improvements will take effect as infrastructure improvements are completed between New York City and Albany-Rensselaer. Thus, program benefits will be realized steadily over time.
- **Ability to Implement:** System simulations show that the work can be sustained at the program levels without interfering with freight or passenger rail services. None of the work requires unproven or special technology and is all well within railroad industry standards.
- **Freight Train Operations:** Service frequency increases, along with future trip time reductions are achieved without interfering with freight rail service.

9.2 Benefits Empire Corridor West:

9.2.1 Travel Benefits (Direct Benefits)

- **Trip Time Reduction:** Overall trip time between Albany/Schenectady—Niagara Falls will be reduced by 1 hour 15 minutes, from the current 5 hour 58 minutes to 4 hours 43 minutes.
- **Increased Frequency:** Service west of Albany to Syracuse and Niagara Falls would grow to 8 roundtrips. The number of trains from Albany-Rensselaer to Syracuse would be increased, and as ridership grows and tracks are improved further west, these increased service frequencies would be gradually extended to Rochester, then Buffalo, and, finally, Niagara Falls.

- **Direct Travel Cost Savings:** Passenger ridership forecasts for High Speed Rail Empire Corridor Program project ridership increasing to 2.7 million riders in 2040. It is estimated that over \$14 million in reduced travel costs would be saved by travelers shifting to rail for its higher speed, reduced trip times, and more reliable performance.
- **Freight Train Operations:** Freight service is not impacted as the programs add 283 miles of third track and 39 miles of fourth track, significantly increasing the overall capacity of the system in keeping with projected increasing demand. These additional tracks are constructed in segments, minimizing the impact to freight and existing passenger train operations during construction. As projects are completed, improvement in freight rail service is expected as well.
- **Improving On-Time Performance and Reliability:** The additional tracks support improvements in OTP and reliability. It is anticipated that a reliability of 95.4% can be achieved, compared to the current value below 80%.

9.2.2 Non-Travel (Indirect) Benefits

- **Environmental Impacts:** All improvements are within the existing right-of-way, resulting in minimal environmental impacts. Some projects contained in the program will require more focused environmental analysis before they can be built. Air quality improvements result as travelers divert from more polluting auto and bus to less polluting trains.
- **Employment and Jobs:** Construction and operation of the improvements Albany-Rensselaer and Niagara Falls will confer significant economic benefit and jobs on upstate cities due to the multiplier effect of spending on material and construction work as well as additional staffing of local businesses in response to the economic infusion created by the program. Employers gain the benefit of drawing upon a larger geographic area for a trained and skilled labor force.
- **Gradual and Continuing Improvement:** For Empire Corridor West, trip time reductions and service improvements will take effect as infrastructure improvements are completed between Niagara Falls and Albany-Rensselaer. Thus, program benefits will be realized steadily over time.
- **Ability to Implement:** System simulations show that the work can be sustained at the program levels without undue interference with freight or passenger rail services. None of the work requires unproven or special technology and is all well within railroad industry standards.
- **Freight Train Operations:** Service frequency increases, along with future trip time reductions are achieved without undue interference with freight rail service.
- **Contribute to Economic Revitalization:** Economic benefits start with the construction activities necessary to complete the supporting projects. Further economic benefits flow from the multiplier effect of increased passenger spending in downtown station areas and the corridor as a whole.

9.3 Operational and Transportation Metrics

It is possible to express the program benefits in terms of travel/mobility, environment, energy, and economics. Exhibit 9-1 displays these benefits over 5-year implementation periods. The cumulative benefits of the program as a whole are shown at the end of the complete 25-year implementation period. (Appendix A shows the year-by-year detail underlying these metrics.) These benefits are driven by gains in ridership which result from improved on-time performance, reduced train delays, and travel time savings due to higher-speed operation. The metrics displayed show metric tons of air pollutant emissions avoided, gallons of diesel fuel saved, direct travel costs avoided by passengers switching from other travel modes to rail, millions of British Thermal Units (BTUs) of energy conserved, and jobs created to build and staff the improvements. The economic benefits are both direct employment for the rail system, indirect employment at businesses supporting the rail system, and as a result of the multiplier effect of construction activity and permanent job increases on local economies.³⁰

Exhibit 9-1 Benefits of High Speed Rail Empire Corridor Program

Benefits (5-Year Periods)	Years 1-5	Years 6-10	Years 11-15	Years 16-20	Years 21-25
Travel Time Savings per Train Each Year, Summed over 5-Year Periods (minutes)	10	36	14	10	24
Cumulative Totals	10	46	60	70	94
Total Minutes of Delay Saved Each Year, Summed over 5-Year Periods (minutes)	35,272	10,120	7,328	14,657	18,490
Cumulative Totals	35,272	45,392	52,720	67,377	85,867
Ridership Increase Each Year, Summed over 5-Year Periods (one- way trips)	221,952	393,536	122,695	87,564	257,674
Cumulative Totals	221,952	615,488	738,183	825,747	1,083,421

³⁰ Diverting Empire Corridor travelers from auto and air services to train will reduce revenue for air carriers and the New York State Thruway Authority. The diversion from auto, while significant in terms of rail riders gained, is quite small in terms of total Corridor auto trips (approximately 1/10th of 1%), however, and the loss of toll revenues due to this diversion is not likely to be of consequence. Air carriers will likely redeploy craft and crew to more heavily used routes to maintain revenue.

Benefits (5-Year Periods)	Years 1-5	Years 6-10	Years 11-15	Years 16-20	Years 21-25
Mode Shift Fare Cost Savings Each Year, Summed over 5-Year Periods (dollars)	6,965,4341	3,833,964	1,492,886	1,064,115	2,244,2246
Cumulative Totals	6,965,434	10,799,398	15,600,624	13,356,399	15,600,624

Direct Employment Each Year, Summed over 5-Year Periods (rail system jobs)	24	42	31	29	47
Cumulative Totals	24	66	97	126,118	173

Key³¹

Travel Time Savings per Train Each Year, Summed over 5-Year Periods (minutes)	The total scheduled minutes saved due to increased train speeds in each year for each train to which the travel time benefit applies, totaled over each 5-year period. Thus, in Year 1 there is no change in travel time for any Empire Corridor trains (no projects are yet completed); in Year 2 every train will gain 2 minutes more than in Year 1 (since all trains traverse the Empire Corridor South segment); in Year 3 every train will travel 2 minutes faster than in year 2; in Year 4 every train will travel 2 minutes faster than in Year 3; and in Year 5 every train will travel 4 minutes faster than in Year 4. The total effect of the Years 1-5 improvements is that every Empire Corridor train in Year 5 will travel 10 minutes faster than they did in Year 1. In Years 6-25, improvements ultimately producing an 84-minute additional time savings will be confined to the Empire Corridor West segment, and only the eight trains traveling beyond Albany to Niagara Falls and back will receive the travel time benefits for each year of improvements; the other 13 NYC-Albany trains will not see any additional travel time improvements.
Total Minutes of Delay Saved Each Year, Summed over 5-Year Periods (minutes)	The product of the reduction of train operating minutes for each train due to improved on-time performance (NYC – Niagara Falls) and the number of trains to which the reduction applies in each year, totaled over each 5-year period. Thus, if the improvement in on-time performance in a particular year results in a 3-minute reduction of delay for four weekday trains, and a 1-minute reduction of delay for nine other weekday trains, the total delay reduction over the entire year would be 5,460 minutes. Over five years, the reductions in delay accomplished in each of the five years are added together to express the reduction in delay at the end of the five-year period compared to the delay at the beginning of the five-year period.
Ridership Increase Each Year, Summed over 5-Year Periods (one-way trips)	The total increase in one-way trips by passengers for all origin-destination pairs (among 17 stations, including Saratoga) in a given year, totaled over each 5-year period. For example, in Year 3, the 2-minute travel time savings achieved through program improvements will draw approximately 55,219 new passengers (each making a single trip) from auto/bus/air to rail. ³²
Mode Shift Fare Cost Savings Each Year, Summed over 5-Year Periods (dollars)	Total fare costs saved by passengers switching to rail from other modes each year (auto mode uses \$0.17/mile + tolls; bus, air and rail use 2010 fares, inflated to 2017 on the basis of northeast Consumer Price Index; https://www.ssa.gov/OACT/STATS/cpiw.html), totaled over each 5-year period.

³¹ See Appendix A for detailed year-by-year results.

³² The same travel time savings may produce slightly different ridership gains in different years because the savings occurs at different areas along the Empire Corridor, with benefits flowing to different origin/ destination pairs with different base ridership values.

Passenger Train Energy Savings Each Year, Summed over 5-Year Periods (gallons of diesel fuel)	Gallons of diesel fuel saved due to the reduction in total minutes of delay for locomotives as a consequence of improved on-time performance, plus the reduction in total minutes of operation due to higher speeds, each year, totaled over each 5-year period. This metric is derived based on locomotives burning 70 gallons of diesel fuel per hour of operation (as an average value across all speeds, including stopped). Thus, if the program improvements in a particular year reduce delay by 6,000 minutes (100 hours), then the savings would be $100 \times 70 = 7,000$ gallons of diesel fuel saved. For Years 1-5, 35,272 minutes – or 588 hours – of delay are saved, and daily trains also receive annual travel time savings of (Year 1) 0 minutes, (Year 2) 2 minutes for all 26 trains, (Year 3) 2 minutes for 30 trains, (Year 4) 2 minutes for 32 trains, and (Year 5) 4 minutes for 34 trains, adding 113,880 – or 1,898 hours – of travel time improvement. The total time savings resulting from reduced delay and faster speeds is therefore 149,152 minutes, or 2,486 hours. This reduced time of operation yields a diesel fuel savings Years 1-5 of $2,486 \text{ hours} \times 70 \text{ gallons/hour} = 174,010$ gallons.
Passenger Train Emissions Savings Each Year, Summed over 5-Year Periods (metric tons of regulated pollutants + GHG)	Metric tons of diesel-range pollutants + CO ₂ emissions avoided in each year (based on 22.2 ³³ pounds of CO ₂ conserved for each gallon of diesel conserved), totaled over each 5-year period. Thus, for Years 1-5, given a savings of 174,010 gallons of diesel fuel, then $174,010 \times 22.2 = 3,863,037$ pounds of pollutants saved. As a metric ton is 2,204 pounds, this translates into 1,753 metric tons of pollutant emissions saved.
Mode Shift Energy Savings Each Year, Summed over 5-Year Periods (millions of BTUs)	Millions of British Thermal Units (BTUs) of energy conserved in each year (totaled over each 5-year period): the net of total additional energy used or conserved from increased rail operations and maintenance (increased) and reduced on-road operations and maintenance due to mode shift of travelers to rail. The Tier 1 Final EIS notes an overall reduction in energy consumption by Empire Corridor travelers of 391,227 million BTUs saved in 2035 due to full program implementation and the diversion of 1,083,000 trips from auto/bus/air to rail. Allocating this total savings on the basis of ridership diverted each year in response to gradual improvements in reliability and speed, an equivalent portion of the overall energy savings is assigned. The value in the Tier 1 Final EIS is derived from industry standard energy profiles for auto, bus, air and rail travel, with increases in rail energy consumption (due to more trains to carry more passengers) offset by decreases in energy use by auto/bus/air as travelers divert to rail. Thus, if the total energy savings is due to the diversion of 1.083 million trips from auto/bus/air to rail in 2035, then the proportion of that diversion represented by each year's ridership gains (totaled over Years 1-5) applied to the total 391,227 million BTUs conserved yields the energy savings in that year due to mode shifts among Empire Corridor travelers. In Years 1-5, 221,952 trips – or 20.4% of the total 1.083 million trips diverted by Year 25 – are diverted from auto/bus/air to rail. Applying the 20.4% to the total 391,227 million BTUs saved over the entire 25-year program produces a result of 80,148 million BTUs saved.

³³ Emission factors for diesel fuel were provided at https://www.epa.gov/sites/production/files/2015-07/documents/emission-factors_2014.pdf

Mode Shift Emissions Savings (metric tons of regulated pollutants + greenhouse gas [GHG])	<p>Metric tons of emissions avoided for all regulated pollutants³⁴ + CO₂ in that year (totaled over each 5-year period): the net of total additional emissions produced or avoided from increased rail operations and maintenance (increased) and reduced on-road operations and maintenance due to mode shift of travelers to rail (avoided). The Tier 1 Final EIS notes an overall reduction in energy consumption by Empire Corridor travelers of 33,188 metric tons of CO₂ saved in 2035 due to full program implementation and the diversion of 1,083,000 trips from auto/bus/air to rail. Allocating this total savings on the basis of ridership diverted each year in response to gradual improvements in reliability and speed, an equivalent portion of the overall energy savings is assigned. The value in the Tier 1 Final EIS is derived from industry standard energy profiles for auto, bus, air and rail travel, with increases in rail energy consumption (due to more trains to carry more passengers) offset by decreases in energy use by auto/bus/air as travelers divert to rail. Thus, if the total energy savings is due to the diversion of 1.083 million trips from auto/bus/air to rail in 2035, then the proportion of that diversion represented by each year's ridership gains (totaled over Years 1-5) applied to the total 33,188 metric tons of CO₂ conserved yields the emissions reduction in that year due to mode shifts among Empire Corridor travelers. In Years 1-5, 221,952 trips – or 20.4% of the total 1.083 million trips diverted by Year 25 – are diverted from auto/bus/air to rail. Applying the 20.4% to the total 33,188 metric tons of CO₂ saved over the entire 25-year program produces a result of 6,799 metric tons of CO₂ saved. Adding the small amount of criteria pollutant emissions avoided (dwarfed by the amount of CO₂ generated burning diesel fuel) produces the result in the table of 6,823 metric tons of emissions saved.</p>
--	--

³⁴ Regulated Pollutants include CO, HC, NOx, SOx, PM_{2.5}, PM₁₀, Ozone, Lead (Pb). Reductions in regulated pollutants are dwarfed by reductions in CO₂ due to cleaner engines and the conversion of 99% of diesel fuel to CO₂ during combustion.

Mode Shift Safety Savings (accidents)	<p>Total accidents avoided due to mode shift from auto/bus/air to rail in each year, totaled over each 5-year period. This metric is derived using data provided by the National Transportation Safety Board and other official sources for accidents per million passenger-miles of travel by air, bus, auto and rail. The accident rates used are:³⁵</p> <p>Auto 1.602941802 accidents/million passenger miles Bus 0.203433744 accidents/million passenger miles Air 0.000046892 accidents/million passenger miles Rail 0.011235955 accidents/million passenger miles</p> <p>Employing these drivers, for each 100 passengers diverted to rail, and applying the diversion percentages derived from the travel demand forecasting model of 50/30/20 for bus/air/auto, and the average trip lengths among origin-destination pairs embedded in the 2010 trip table that is the basis for all travel demand forecasting associated with this program, the reduction in accidents is derived as $(50 \times 0.203433744 \times \text{the average trip distance}) + (30 \times 0.000046892 \times \text{the average trip distance}) + (20 \times 1.602941802 \times \text{the average trip distance}) - (100 \times 0.011235955 \times \text{the average trip distance}) = \text{the net accidents avoided for each 100 travelers diverted to rail.}$</p>
Job Creation Each Year, Summed over 5-Year Periods (job-years)	<p>Total job-years created across all economic sectors due to construction activity, increased rail operations (direct employment), and increased related economic activity (indirect employment) in each year, totaled over each 5-year period. Although the metric provides a final number in the 25th year, the additional job-years created by the 25th year of the program due to increased rail operations is perpetual, resulting in 2,702 additional permanent employees on the railroad system. A Transportation Economic Development Impact System (TREDIS) model was used to develop total economic activity flowing from rail improvement investments, across all economic sectors. A total of 55,777 total job years³⁶ were predicted to result from the construction over the 25-year program term.³⁷ These were allocated proportionally by year on the basis of annual program investments accumulated in five-year segments.</p>

³⁵ Multiple sources.

³⁶ An analysis by HNTB resulted in an estimate of 2,129 job-years/year for the program at a \$6 billion funding level. Escalating this to \$7.323 billion and adding the job-years created due to the ripple effect of permanent railroad jobs added as infrastructure maintenance and operational needs expand, and then subtracting the direct rail jobs created to staff this infrastructure maintenance and operations produces the 55,777 job-years value attributed to the program.

³⁷ On a national standard, each \$1 billion of investment typically generates 7,700-8,100 job-years. Applying that metric range produces a range of potential economic impacts for the \$7.323 billion program of 56,378 – 59,316 job years created.

Direct Employment Each Year, Summed over 5-Year Periods (rail system jobs)	Additional rail jobs required to operate and maintain new infrastructure and additional trains, as needed in each year as improvements are built or new train service is added, totaled over each 5-year period. These were derived using industry-standard metrics of workers per unit of rail infrastructure (miles of track or number of switches, square footage of stations, per train crew requirements). For train crews, a distinction is made if trains are weekday only (two crews) or seven days a week (three crews). Train crew values also recognize contractual requirements for layover, hours of service limitations, and other factors that affect staffing requirements. Infrastructure maintenance staffing is a direct function of unit values, as maintenance staff are typically assigned to and pick jobs on a single-shift basis.

Notes/Definitions

Per Train Travel Time Savings is the total scheduled minutes saved due to increased train speeds in each year for each train to which the travel time benefit applies, totaled over each 5-year period. Thus, in Year 1 there is no change in travel time for any Empire Corridor trains (no projects are yet completed); in Year 2 every train will gain 2 minutes more than in Year 1 (since all trains traverse the Empire Corridor segment); in Year 3 every train will travel 2 minutes faster than in year 2; in Year 4 every train will travel 2 minutes faster than in Year 3; and in Year 5 every train will travel 4 minutes faster than in Year 4. The total effect of the Years 1-5 improvements is that every Empire Corridor train in Year 5 will travel 10 minutes faster than they did in Year 1. In Years 6-25, improvements ultimately producing an 84-minute time savings will be confined to the Empire Corridor West segment, and only the eight trains traveling beyond Albany to Niagara Falls and back will receive the travel time benefits for each year of improvements. Passengers traveling between NYC and Albany during Years 6-25 will receive no further travel time benefit after Year 5, as the improvements in speed and travel time occur west of Albany during that period.

Annual Minutes of Delay Saved is the product of the reduction of train operating minutes for each train due to improved on-time performance (NYC – Niagara Falls) and the number of trains to which the reduction applies in each year, totaled over each 5-year period. Thus, if the improvement in on-time performance in a particular year results in a 3-minute reduction of delay for four weekday trains, and a 1-minute reduction of delay for nine other weekday trains, the total delay reduction over the entire year would be 5,460 minutes, or 455 hours of delay saved in that year. Over five years, the reductions in delay accomplished in each of the five years are added together to express the reduction in delay at the end of the five-year period compared to the delay at the beginning of the five-year period.

Ridership Increase is the total increase in one-way trips by passengers for all origin-destination pairs (among 17 stations, including Saratoga) in a given year, totaled over each 5-year period. For example, in Year 3, the 2-minute travel time savings achieved through program improvements will draw approximately 55,219 new passengers (each making a single trip) from auto/bus/air to rail.³⁸

Mode Shift Fare Cost Savings is the total fare costs saved by passengers switching to rail from other modes each year (auto mode uses \$0.17/mile + tolls; bus, air and rail use 2010 fares, inflated to 2017 on the basis of northeast CPI; <https://www.ssa.gov/OACT/STATS/cpiw.html>), totaled over each 5-year period.

Passenger Train Energy Savings is the gallons of diesel fuel saved due to the reduction in total minutes of delay for locomotives as a consequence of improved on-time performance, plus the reduction in total minutes of operation due to higher speeds, each year, totaled over each 5-year period. This metric is derived based on locomotives burning 70 gallons of diesel fuel per hour of operation (as an average value across all speeds, including stopped). Thus, if the program improvements in a particular year reduce delay by 6,000 minutes (100 hours), then the savings would be 100 X 70 = 7,000 gallons of diesel fuel saved. For Years 1-5, 35,272 minutes – or 588 hours – of delay are saved, and daily trains also receive annual travel time savings of (Year 1) 0 minutes, (Year 2) 2 minutes for all 26 trains, (Year 3) 2 minutes for 30 trains, (Year 4) 2 minutes for 32 trains, and (Year 5) 4 minutes for 34 trains, adding 113,880 – or 1,898 hours – of travel time improvement. The total time savings resulting from reduced delay and faster speeds is therefore 149,152 minutes, or 2,486 hours. This reduced time of operation yields a diesel fuel savings Years 1-5 of 2,486 hours X 70 gallons/hour = 174,010 gallons.

Passenger Train Emission Savings is the metric tons of diesel-range pollutants + CO2 emissions avoided in each year (based on 22.2³⁹ pounds of CO2 conserved for each gallon of diesel conserved), totaled over each 5-year period. Thus, for Years 1-5, given a savings of 174,010 gallons of diesel fuel, then 174,010 X 22.2 = 3,863,037 pounds of pollutants saved. As a metric ton is 2,204 pounds, this translates into 1,753 metric tons of pollutant emissions saved.

Mode Shift Energy Savings is the millions of BTUs of energy conserved in each year (totaled over each 5-year period): the net of total additional energy used or conserved from increased rail operations and maintenance (increased) and reduced on-road operations and maintenance due to mode shift of travelers to rail. The Tier 1 Final EIS notes an overall reduction in energy consumption by Empire Corridor travelers of 391,227 million BTUs saved in 2035 due to full program implementation and the diversion of 1,083,000 trips from auto/bus/air to rail. Allocating this total savings on the basis of ridership diverted each year in response to gradual improvements in reliability and speed, an equivalent portion of the overall energy savings is assigned. The value in the Tier 1 Final EIS is derived from industry standard energy profiles for auto, bus, air and rail travel, with increases in rail energy consumption (due to more trains to carry more passengers) offset by decreases in energy use by auto/bus/air as travelers divert to rail. Thus, if the total energy savings is due to the diversion of 1.083 million trips from auto/bus/air to rail in 2035, then the proportion of that diversion represented by each year’s ridership gains (totaled over Years 1-5) applied to the total 391,227 million BTUs conserved yields the energy savings in that year due to mode shifts among Empire Corridor travelers. In Years 1-5, 221,952 trips – or 20.4% of the total 1.083 million trips diverted by Year 25 – are diverted from auto/bus/air to rail. Applying the 20.4% to the total 391,227 million BTUs saved over the entire 25-year program produces a result of 80,148 million BTUs saved.

Mode Shift Emissions Savings is the metric tons of emissions avoided for all regulated pollutants⁴⁰ + CO2 in that year (totaled over each 5-year period): the net of total additional emissions produced or avoided from increased rail operations and maintenance (increased) and reduced on-road operations and maintenance due to mode shift of travelers to rail (avoided). The Tier 1 Final EIS notes an overall reduction in energy consumption by Empire Corridor travelers of 33,188 metric tons of CO2 saved in 2035 due to full program implementation and the diversion of 1,083,000 trips from auto/bus/air to rail. Allocating this total savings on the basis of ridership diverted each year in response to gradual improvements in reliability and speed, an equivalent portion of the overall energy savings is assigned. The value in the Tier 1 Final EIS is derived from industry standard energy profiles for auto, bus, air and rail travel, with increases in rail energy consumption (due to more trains to carry more passengers) offset by decreases in energy use by auto/bus/air as travelers divert to rail. Thus, if the total energy savings is due to the diversion of 1.083 million trips from auto/bus/air to rail in 2035, then the proportion of that diversion represented by each year’s ridership gains (totaled over Years 1-5) applied to the total 33,188 metric tons of CO2 conserved yields the emissions reduction in that year due to mode shifts among Empire Corridor travelers. In Years 1-5, 221,952 trips – or 20.4% of the total 1.083 million trips diverted by Year 25 – are diverted from auto/bus/air to rail. Applying the 20.4% to the total 33,188 metric tons of CO2 saved over the entire 25-year program produces a result of 6,799 metric tons of CO2 saved. Adding the small amount of criteria pollutant emissions avoided (dwarfed by the amount of CO2 generated burning diesel fuel) produces the result in the table of 6,823 metric tons of emissions saved.

³⁸ The same travel time savings may produce slightly different ridership gains in different years because the savings occurs at different areas along the Empire Corridor, with benefits flowing to different origin/ destination pairs with different base ridership values.

³⁹ Emission factors for diesel fuel were provided at https://www.epa.gov/sites/production/files/2015-07/documents/emission-factors_2014.pdf

⁴⁰ Regulated Pollutants include CO, HC, NOx, SOx, PM_{2.5}, PM₁₀, Ozone, Lead (Pb). Reductions in regulated pollutants are dwarfed by reductions in CO₂ due to cleaner engines and the conversion of 99% of diesel fuel to CO₂ during combustion.

Mode Shift Safety Savings is the total accidents avoided due to mode shift from auto/bus/air to rail in each year, totaled over each 5-year period. This metric is derived using data provided by the National Transportation Safety Board and other official sources for accidents per million passenger-miles of travel by air, bus, auto and rail. The accident rates used are:⁴¹

- Auto 1.602941802 accidents/million passenger miles
- Bus 0.203433744 accidents/million passenger miles
- Air 0.000046892 accidents/million passenger miles
- Rail 0.011235955 accidents/million passenger miles

Employing these drivers, for each 100 passengers diverted to rail, and applying the diversion percentages derived from the travel demand forecasting model of 50/30/20 for bus/air/auto, and the average trip lengths among origin-destination pairs embedded in the 2010 trip table that is the basis for all travel demand forecasting associated with this program, the reduction in accidents is derived as (50 X 0.203433744 X the average trip distance) + (30 X 0.000046892 X the average trip distance) + (20 X 1.602941802 X the average trip distance) – (100 X 0.011235955 X the average trip distance) = the net accidents avoided for each 100 travelers diverted to rail.

Job Creation is the total job-years created across all economic sectors due to construction activity, increased rail operations (direct employment), and increased related economic activity (indirect employment) in each year, totaled over each 5-year period. Although the metric provides a final number in the 25th year, the additional job-years created by the 25th year of the program due to increased rail operations is perpetual, resulting in 2,702 additional permanent employees on the railroad system. A Transportation Economic Development Impact System (TREDIS) model was used to develop total economic activity flowing from rail improvement investments, across all economic sectors. A total of 55,777 total job years⁴² were predicted to result from the construction over the 25-year program term.⁴³ These were allocated proportionally by year on the basis of annual program investments accumulated in five-year segments.

Direct Employment is the additional rail jobs required to operate and maintain new infrastructure and additional trains, as needed in each year as improvements are built or new train service is added, totaled over each 5-year period. These were derived using industry-standard metrics of workers per unit of rail infrastructure (miles of track or number of switches, square footage of stations, per train crew requirements). For train crews, a distinction is made if trains are weekday only (two crews) or seven days a week (three crews). Train crew values also recognize contractual requirements for layover, hours of service limitations, and other factors that affect staffing requirements. Infrastructure maintenance staffing is a direct function of unit values, as maintenance staff are typically assigned to and pick jobs on a single-shift basis.

⁴¹ Multiple sources.
⁴² An analysis by HNTB resulted in an estimate of 2,129 job-years/year for the program at a \$6 billion funding level. Escalating this to \$7.323 billion and adding the job-years created due to the ripple effect of permanent railroad jobs added as infrastructure maintenance and operational needs expand, and then subtracting the direct rail jobs created to staff this infrastructure maintenance and operations produces the 55,777 job-years value attributed to the program.
⁴³ On a national standard, each \$1 billion of investment typically generates 7,700-8,100 job-years. Applying that metric range produces a range of potential economic impacts for the \$7.323 billion program of 56,378 – 59,316 job years created.

SDP Errata

PAGE INTENTIONALLY BLANK

Errata for Service Development Plan

The following table contains additions, corrections, and clarifications to the Service Development Plan (SDP) for the High Speed Rail Empire Corridor Program that was originally prepared in 2017. Additions to the original text are shown in bold text, and deletions are shown in red strike-outs. These additions, corrections, and clarifications do not reflect any changes to the technical analysis reflected in the SDP, which may be subject to updating as elements of the Tier 1 Final EIS are advanced into Tier 2 environmental analysis.

Errata Sheet for Service Development Plan

#	Page #	Original SDP Text	Revised SDP Text	Reason for Changes
1	p. 1	Carrying forward a vision for the future, New York has one of the largest state-supported programs for improving intercity rail passenger service in the nation, that has included installation of a second track between Albany-Rensselaer and Schenectady.	Carrying forward a vision for the future, New York has one of the largest state-supported programs for improving intercity rail passenger service in the nation, that has included installation of a second track between Albany-Rensselaer and Schenectady and station reconstruction at Buffalo-Exchange Street, Niagara Falls, Schenectady, and Rochester.	Text has been updated to reflect major station reconstructions over the past 10 years.
2	p. 1	Enhancements to the intercity rail passenger network will complement the extensive commuter train system In the New York City metropolitan area that has become an integral part of lives of residents of 11 city and suburban counties served by the Metropolitan Transportation Authority (MTA).	Enhancements to the intercity rail passenger network will complement the extensive commuter train system in in the New York City metropolitan area that has become an integral part of lives of residents of 11 city and suburban counties served by the Metropolitan Transportation Authority (MTA), the busiest commuter railroad in the country.	Clarified high use of MTA railroad when compared with other commuter railroads nationally.
3	p. 2	Now, investments as part of the High Speed Rail Empire Corridor Program will support rail as a modern, fast, and reliable part of the transportation network that spans the state from New York City to Niagara Falls.	Now, investments as part of the High Speed Rail Empire Corridor Program will support rail as a modern, fast, and reliable part of the transportation network that spans the state from New York City to Niagara Falls. The Empire Corridor is one of eleven designated high-speed rail corridors nationwide, initially authorized under the Intermodal Surface Transportation Efficiency	Added history of federal high-speed rail designations and historic transportation use of the corridor. Highlighted the importance of Empire Corridor nationally for both passenger and freight rail.

#	Page #	Original SDP Text	Revised SDP Text	Reason for Changes
		As New York moves forward with its High Speed Rail Empire Corridor Program, with support from the Federal Railroad Administration (FRA), the state continues its commitment to supporting the improvement of Empire Corridor intercity passenger rail service. This program lays the foundation for a greater level of investments and improvements than previously, continuing New York's 200-year legacy of supporting public transportation as far back as the Erie Canal and Mohawk & Hudson Railroad of the 1800s.	<p>Act of 1991 (ISTEA) and supplemented by the Transportation Equity Act for the 21st Century of 1998 (TEA-21).</p> <p>As New York moves forward with its High Speed Rail Empire Corridor Program, with support from the Federal Railroad Administration (FRA), the state continues its commitment to supporting the improvement of Empire Corridor intercity passenger rail service. This program lays the foundation for a greater level of investments and improvements than previously, continuing New York's 200-year legacy of supporting public transportation as far back as the Erie Canal and Mohawk & Hudson Railroad of the 1800s. The Empire Corridor developed along the historic "Water Level Route" that followed the canal system connecting Lake Erie and the Hudson River to transport goods and services to and from New York City. The corridor helped to strengthen New York City as the preeminent U.S. trade center, by connecting markets in Canada and the Midwest with Albany, Montreal, Boston, and New York City. For many decades, the railroad was operated by the New York Central Railroad as a four-track mainline between Albany and Buffalo carrying passenger and freight trains on express and local tracks. As rail passenger travel declined post-World War II, the New York Central Railroad (NYCRR) began to reduce its operating costs by removing tracks, starting in the late 1950s, and thinning service. The line exists today as a two-track system between Albany and Buffalo (where it is a heavily used shared-use corridor with freight), continuing as a single track right-of-way on portions of the line extending north beyond Buffalo to Niagara Falls. This two-track line along Empire Corridor West is the busiest freight track in the state, carrying one of the highest volumes on the CSXT system nationwide.</p> <p>In addition to improving mainline passenger rail service among the State's major population centers of</p>

			<p>New York City, Albany, Schenectady, Utica, Rome, Syracuse, Rochester, and Buffalo, the program will benefit regional services operating along portions of the Empire Corridor for:</p> <ul style="list-style-type: none"> ▪ the Lake Shore Limited (from Boston to Albany), ▪ the Adirondack (from Schenectady to Montreal), ▪ the Ethan Allen Express (from Schenectady to Rutland, VT), ▪ the Lake Shore Limited West (from Buffalo to Chicago), and ▪ the Maple Leaf Service (from Niagara Falls to Toronto). <p>The Empire Corridor is therefore essential to New York in that it will significantly enhance this rail corridor's ability to transport large numbers of passengers and goods among these key population centers using energy and space-efficient rail services rather than highways and air travel corridors. The corridor is distinguished by its diversity of ownership and operating control and the mix of passenger and freight usage it supports, as the National Railroad Passenger Corporation's (Amtrak's) Empire Service shares tracks with CSXT and the Metropolitan Transportation Authority's Metro-North Railroad (Metro-North) commuter rail between NYC and its northern counties of Westchester and Dutchess.</p>

The Lake Shore Limited (Trains #48 and #49) runs west past Buffalo to Cleveland and Chicago, and east past Albany to Boston, Massachusetts. These services were included as part of the network simulation for the program, to ensure that the proposed train improvements are feasible, that the program can be delivered as intended, and that it will meet program objectives. These trains have also been recognized in discussions of ridership in the Tier 1 EIS and this SDP.</p> <p>In addition to these services, a pilot service for the Berkshire Flyer operated on weekends in the summer of 2022 from New York City to Pittsfield, Massachusetts. This seasonal pilot program, sponsored by MassDOT, in cooperation with NYSDOT, is expected to continue in the summer of 2023.</p> <p>NYSDOT is currently planning improvements to the Syracuse Station for provide improved access to the New York State Fairgrounds Stop. This stop also operates on a seasonal basis, depending on events at the Fairgrounds.</p>	<p>Clarified train numbers for Ethan Allen and Lake Shore Limited routes for consistency. Updated discussion of regional services, as well as recent updates for season services.</p>

35	p. 22	The geographic distribution of ridership on the Empire Corridor is shown in Exhibit 3-2. The majority of the route's ridership is concentrated between NYC and Albany. The route between Albany-Rensselaer and New York City is the third busiest rail route in the nation, and is used by Empire Corridor trains as well as trains serving Montreal and Vermont. Ridership on the Empire Corridor has been growing steadily for the past decade, reaching 1.6 million passengers in 2016. As NYSDOT improves Empire Corridor infrastructure and services, Corridor ridership will continue to grow in response to faster trips and improved reliability.	The geographic distribution of ridership (2019) on the Empire Corridor is shown in Exhibit 3-2. The majority of the route's ridership is concentrated between NYC and Albany. The route between Albany-Rensselaer and New York City is the third busiest rail route in the nation, and is used by Empire Corridor trains as well as trains serving Boston (on the Lake Shore Limited), Montreal (on the Adirondack), and Vermont (on the Ethan Allen Express). The route west of Albany to Buffalo is used by trains serving destinations to the west, such as Cleveland, Toledo, and Chicago (Lake Shore Limited West) and trains traveling to Niagara Falls can continue on to Toronto (Maple Leaf). Ridership on the Empire Corridor has been growing steadily for the past decade, reaching 1.6 million passengers in 20192046. This Amtrak estimate includes Albany-Niagara Falls Toronto trips which includes trips on the Maple Leaf Service. The other services along the Adirondack, Ethan Allen Express, and Lake Shore Limited totaled approximately 526,000 trips, for a total of 2.1 million passengers traveling on Empire Corridor in 2019. Exhibit 3-2 shows the relative proportion of these services. As NYSDOT improves Empire Corridor infrastructure and services, Corridor ridership will is expected to continue to grow in response to faster trips and improved reliability.	Provided ridership updates for 2019, clarified ridership on other Amtrak Services using Empire Corridor, and add updated Exhibit 3-2 (in Addenda).

High Speed Rail Empire Corridor Service Development Plan Errata

#	Page #	Original SDP Text	Revised SDP Text	Reason for Changes
88	p. 73	The overall program is estimated to cost \$7.323 billion (2017 dollars). Although the Tier 1 Final EIS for this program indicates a capital cost over 20 years of just under \$6 billion, as this program was developed in more detail for this SDP, it was realized that the most efficient approach to rail infrastructure upgrades on an increasingly heavily used operating line is to visit each repair location once, and to upgrade to a state of good repair all elements at that location, even if they are not directly related to program objectives.	The overall program is estimated to cost \$8.8 \$7.323 billion (2017 dollars). Although the Tier 1 Final EIS for this program indicates a capital cost over 20 years of just under \$6 billion, as this program was developed in more detail for this SDP, it was realized that the most efficient approach to rail infrastructure upgrades on such an increasingly heavily used operating line is to visit each repair location only once, and to upgrade to a state of good repair all infrastructure elements at that location, even if every repair or upgrade is indirectly they are not directly related to program objectives.	Updated program cost and approach. Program cost updated globally.
89	p. 73	Thus, if the program seeks the realignment and upgrade of a single track over a three-track bridge, it makes sense for both reasons of efficiency and reasons of collateral benefit to the service to upgrade the other two tracks as well.	Thus, if the program seeks the realignment and upgrade of a single track over a three-track bridge, it makes sense for both reasons of efficiency and reasons of collateral benefit to both the passenger and freight services service to upgrade the other two tracks as well.	Updated approach.
90	p. 73	This avoids the need to return sometime later to address the other two tracks and, more importantly, leaves CSXT as the operator with greater flexibility to dispatch freight and passenger trains such that the passenger trains can still operate at the allowable speed, regardless to which track they are assigned.	This avoids the need to return to the same location sometime at a later time to address the other two tracks and, more importantly, leaves CSXT as the operator with greater flexibility to dispatch freight and passenger trains such that the passenger trains can still operate at the allowable speed, regardless to which track they are assigned.	Updated approach.

#	Page #	Original SDP Text	Revised SDP Text	Reason for Changes
91	p. 73	This improved dispatch and operational flexibility gives much greater likelihood of consistent, reliable, High Speed passenger service regardless of the freight traffic running in parallel.	This improved dispatch and operational flexibility gives much greater likelihood of consistent, reliable, High-high Speed speed passenger service regardless of whether there is of the freight traffic running in parallel over the same segment of right-of-way .	Updated approach.
92	p. 73	This decision increases the program cost, by bringing the entire freight/passenger network up to higher speed track standards.	This decision to address all State of Good Repair elements at a work location necessarily increases the overall program cost. ; However, doing this benefits the program by bringing the entire freight/passenger network-rail infrastructure up to a State of Good Repair and to the higher speed track standards required to enable higher-speed passenger service, regardless of which tracks CSXT may dispatch passenger trains on any given day. In addition to the decision to broaden the implementation of high-speed infrastructure and State of Good Repair conditions over the entire right-of-way, the program also incorporates other improvements that were not specifically itemized in the Tier 1 Final EIS, but that fulfill the program objectives (without incurring additional impacts) for the section of track north of Poughkeepsie (MP 75), at the end of Metro-North territory; i.e., curve straightening along the Hudson Line to facilitate 110 mph operation and signalization to improve capacity.	Updated approach.
93	p. 74	Complete station reconstruction, ADA compliant platform and station access, viaduct repairs and parking improvements. Under Construction	Complete station reconstruction, ADA compliant platform and station access, viaduct repairs and parking improvements. Under Construction Completed	Updated status of Base Project EW-01, Schenectady Station Renovation/Platform Improvements.

128	p. 105	The 2-hour trip time target represents a 15-minute savings for passengers between Albany and New York City. The 30-minute trip time reduction will be accrued incrementally as the supporting projects are completed. This reduction benefits 90% of the ridership on the Empire Corridor.	The 2-hour and 15-minute trip time target represents a 30- 15-minute savings for passengers between Albany and New York City. The 30-15-minute trip time reduction will be accrued incrementally as the supporting projects are completed. This reduction benefits 90% of the ridership on the Empire Corridor.	Clarified trip time savings. This change has been made globally.
129	pp. 106 and 107	Passenger ridership forecasts for High Speed Rail Empire Corridor Program project ridership increasing to 2.7 million riders in 2040.	Passenger ridership forecasts for High Speed Rail Empire Corridor Program project ridership increasing to 2.7 2.6 million riders in with implementation of the full program 2040 .	Updated project ridership forecast. This change has been made globally.
130	p. 107	All improvements are within the existing right-of-way, resulting in minimal environmental impacts. Some projects contained in the program will require more focused environmental analysis before they can be built.	All improvements are situated within the existing right-of-way, resulting in minimal environmental impacts. Some projects contained in the program will require more focused environmental analysis before they can be built. The program is anticipated to result in a diversion from highways of 209,279 one-way trips, which will result in benefits in terms of both relieving traffic congestion and reducing air quality emissions. The long-term impact on greenhouse gas emissions is positive. The Tier 1 Final EIS concluded that the net annual operational benefits for the Preferred Alternative would be roughly equivalent to eliminating the emissions associated with the energy and electricity consumption of 2,500 to 4,200 average U.S. single family homes every year. ³³ ³³ Based on U.S. EPA's GHG Equivalencies Calculator, <http://www.epa.gov/cleanenergy/energy-resources/calculator.html>.	Updated project benefits discussion.

#	Page #	Original SDP Text	Revised SDP Text	Reason for Changes
131	p. 106	Operation of trains at higher speeds between Albany-Rensselaer and New York City creates opportunities for “super-commuters” to live and work from greater distances away from job centers while enjoying shorter commuting time and expanded employment opportunities. Employers gain the benefit of drawing upon a larger geographic area for a trained and skilled labor force.	<p>Operation of trains at higher speeds between Albany-Rensselaer and New York City creates opportunities for “super-commuters” to live and work from greater distances away from job centers, while enjoying shorter commuting time and expanded employment opportunities. Employers gain the benefit of drawing upon a larger geographic area for a trained and skilled labor force. According to a U.S. Conference of Mayor’s Report,³⁴ which examined the impact of high-speed rail on the City of Albany, the introduction of high-speed rail along the corridor can contribute substantially to economic growth by driving higher-density, mixed-use development at train stations; expanding visitor markets and generating additional spending; broadening regional labor markets; and supporting the growth of technology clusters. This report projects that economic benefits of New York City to Albany high-speed rail service to the Albany metropolitan area alone would range from \$358 million (with 79/90 mph service). The economic analysis of the construction of the program estimated that the program would create approximately 68,048 job-years, and other benefits are presented in Exhibit 9-1.</p> <p>³⁴ Economic Development Research Group, Inc. The Economic Impact of High Speed Rail and Cities and their Metropolitan Areas. Prepared for the U.S. Conference of Mayors (undated), released June 2010.</p>	Updated to include U.S. Conference of Mayor’s Report which examined the impact of high-speed rail in Albany.

High Speed Rail Empire Corridor Service Development Plan Errata

#	Page #	Original SDP Text	Revised SDP Text	Reason for Changes
132	p. 106	For Empire Corridor South, trip time reductions and service improvements will be take effect as infrastructure improvements are completed between New York City and Albany-Rensselaer. Thus, program benefits will be realized steadily over time.	For Empire Corridor South, trip time reductions and service improvements will take effect as infrastructure improvements are completed between New York City and Albany-Rensselaer. Thus, program benefits will be realized steadily over time. The focus for travel time improvements was on the most frequently traveled corridor between New York City and Albany-Rensselaer, with most of these improvements occurring over the first 1 to 5 years of the start of construction and all being completed within 10 years.	Updated project benefits discussion.
133	p. 106	Overall trip time between Albany/Schenectady—Niagara Falls will be reduced by 1 hour 15 minutes, from the current 5 hour 58 minutes to 4 hours 43 minutes.	Overall trip time between Albany/Schenectady—Niagara Falls will be reduced by approximately 1 hour 15 minutes, from the current 5 hour 58 minutes to 4 hours 43 minutes.	Clarified travel time savings.
134	p. 107	Freight service is not impacted as the programs add 283 miles of third track and 39 miles of fourth track, significantly increasing the overall capacity of the system in keeping with projected increasing demand.	Freight service is not impacted as the programs will add 283 miles of third track and 39 miles of fourth track, significantly increasing the overall system capacity of the system in keeping with projected increasing demand. The program would provide a 10 percent decrease in freight train delay minutes over the Base Alternative.	Updated freight service benefits.
135	p. 107	All improvements are within the existing right-of-way, resulting in minimal environmental impacts. Some projects contained in the program will require more focused environmental analysis before they can be built. Air quality improvements result as travelers divert from more polluting auto and bus to less polluting trains.	All The majority of the track improvements are situated within the existing right-of-way, resulting in minimal environmental impacts. Some projects contained in the program will require more focused environmental analysis before they can be built. Air quality improvements would result as travelers divert from more polluting auto and bus to less polluting trains. As summarized in the prior section and presented in the Tier 1 EIS, the program would result in a substantial diversion of passengers to rail from automotive uses, resulting in a substantial decrease in pollutant emissions.	Clarified project benefits discussion.

High Speed Rail Empire Corridor Program – 25-Year Capital Improvement Program

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
SRP-01 (ESC-19,ESC 21)	Empire Line - Spuyten Duyvil 2nd Track	This project will add second track between Mile Post 9 and Mile Post 13, including across the Spuyten Duyvil Movable Bridge, eliminating conflicts between Amtrak trains traveling in opposite directions, and provide Amtrak trains higher speed crossovers at Control Point 13, where Amtrak trains to and from New York converge/diverge with MetroNorth Trains to and from Grand Central Station, which will decrease delays.	Empire South	Amtrak MetroNorth	Bronx	Bronx	Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	9.32	13	\$90,229,715
ESC-18	Hudson Line - Tarrytown 3rd Track and Interlockings	This project will construct new Tarrytown 3rd track and new Control Point 24. This project will enhance capacity and improve reliability by providing for trains to change direction at the existing Control Point 25 without having to change ends while blocking the mainline track.	Empire South	MetroNorth	Tarrytown	Westchester	New or restored sidings/passing tracks	Reduce Delay, Add Capacity, Improve Operation	25	24	\$5,388,547
SRP-03 (ESC17, ESC-25)	Hudson Line - Croton Harmon 3rd Track and Interlockings	This project will provide capacity, and minimizing delays by constructing 3rd track beginning at Control Point 53 (Hudson Highlands) to Control Point 59 (Beacon) and from Control Point 61 (Beacon) to Control Point 63 (Chelsea). This project will also construct double-track section between Control Point 63 (Chelsea) and Control Point 72 (Poughkeepsie). This project will also construct new high speed cross-overs at interlockings including Control Point 53, Control Point 58, new Control Point 63 (replacing Control Point 61), and Control Point 72. This project will include signal upgrades needed to support the additional track and new interlockings.	Empire South	MetroNorth	Willsboro, Westport, Essex	Essex	Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	63	53	\$128,528,340
ESC-12	Hudson Line High Capacity Signal System - Croton Harmon to Poughkeepsie	This project will construct a new signal system capable of closer-headway between passenger trains between Croton-Harmon and Poughkeepsie, where the existing signal block spacing is far apart, in order to increase capacity. The new signal system will also all freight trains to continue to operate at speed up to 50 MPH.	Empire South	MetroNorth	Poughkeepsie	Dutchess, Putnam, Westchester	Communication, Signaling, and Control	Reliability, Capacity	76	33	\$99,910,482
ESC-13	Poughkeepsie Capacity Improvements, Poughkeepsie Yard	This project will reduce congestion between Amtrak trains and MetroNorth Commuter trains by installing two new interlockings, adding three new yard tracks, upgrading, and realigning existing tracks. This project will also consolidate and reconfigure storage tracks to reduce train movements across the main lines. The new Track 3 will provide capacity for MetroNorth trains originating and terminating in Poughkeepsie while allowing for Amtrak trains to have the through movement on Tracks 1 and 2. The area between Mile Post 76 and Mile Post 71 consists of Poughkeepsie Station, which is serviced by both Amtrak and MetroNorth and the MetroNorth Poughkeepsie Yard. Currently passenger trains are delayed in this area due to interference with commuter trains, the proximity of the station to the yard, and the existing yard configuration, which requires trains to cross the mainline tracks to access the yard contribute to these delays.	Empire South	MetroNorth	Poughkeepsie	Dutchess	New or restored sidings/passing tracks	Reduce Delay, Add Capacity, Improve Operation	76	71	\$64,155,768

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
ESC-20	Rhinecliff Station High Level Platform, Vertical Circulation	This project will replacing the existing low-level platform with a new high level platform at Rhinecliff Station. This project will also include necessary drainage work, replace the platform canopy, install new lighting, and replacing the elevator and stairs to and from the station (vertical circulation), construct areas of refuge and emergency egress as required by code. The project will also rehabilitate the interlocking at Control Point 89 and install a new interlocking at Control Point 88 to facilitate platform construction and improve overall reliability on the Hudson Line. This project will also rehabilitate and realign Tracks 1 and 2 between the two interlockings as necessary to accommodate the new platform footprint.	Empire South	Amtrak	Rhinecliff	Dutchess	High Level Platform	Reliability, Safety, Reduce Trip Time	89	89	\$40,318,425
ESC-14	Hudson Station Passenger Grade Crossing Elimination, New High Level Platform and Vertical Circulation	This project will eliminate the need for passengers to cross active tracks to board the train, by constructing a new high level platform with stairs, elevators, pedestrian bridge at the Hudson Station. This project will improve train operations by allowing two trains to serve the station at the same time. Currently, the ticket agent must use a “Wheel Chair Lift” to raise the passenger from the platform to the vestibule of the passenger coach, this project will provide for ADA compliant level boarding of trains. The benefits of this project include reducing the station dwell time for accommodating passengers boarding and exiting trains, and in conjunction with the project at Rhinecliff Station, this project will provide for all train stations between New York City and Albany-Rensselaer to have high level platforms.	Empire South	Amtrak	Hudson		Grade Crossing Elimination, High Level Platform, Vertical Circulation	Reliability, Safety, Reduce Trip Time	115	114	\$44,370,183
ESC-04	Hudson Line - Slope Stabilization	This project will improve reliability by stabilizing slopes adjacent to the tracks at 10 locations (5 locations between, Mile Posts 105.3-106, one location at Mile Post 119.5, and 4 locations at Mile Posts 128.1-130), and upgrading slide detector fences to improve safety and reduce delays. Currently, there are locations on the Hudson Line, where rock/earth falls onto the tracks from unstable slopes, causing train delays. This project will enhance safety for rail passengers, railroad employees, and the surrounding community by preventing rocks/earth from falling onto the tracks, which has the potential to delay trains through speed restrictions imposed by the slide fences, and to cause train derailments.	Empire South	Amtrak		Columbia, Dutchess	Safety, State of Good Repair	Operational Benefits, Safety	130	105	\$8,739,582
ESC-05	Hudson Line - New Interlockings CP 82 / 99 / 136 (north of Hyde Park, Tivoli, and Stony Point)	This project will construct three new interlockings, improving reliability by reducing spacing between the existing interlockings, improving dispatching options to meet and pass trains, especially during routine maintenance, which will decrease delays. Approximate locations on the Hudson Line are north of Hyde Park, Tivoli, and Stony Point.	Empire South	Amtrak	Hudson, Rhinecliff, Germantown	Columbia, Dutchess	Signal and Interlockings	Reduce Delay, Add Capacity, Improve Operation	136	82	\$23,881,294

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
ESC-36	Hudson Line Speed Improvements Phase 1 CP-75 to CP-114	This project will straightening vertical and horizontal curves to permit higher speed, realign tracks to reduce curvature, increase spiral lengths, and increase superelevation in order to facilitate speed increases on sections of the Hudson Line. This project includes locations where realigned track curve corrections fall within the existing railroad right-of-way. This project will also include surfacing and tie replacement to improve track resiliency, and keep the track within the higher maintenance standards required for 110 MPH operations. This project will also rehabilitate existing bridges to facilitate new track alignments, and comply with the track maintenance standards for operating at higher speeds. Within the curve realignment sections, the condition of the tracks and bridges will be brought to a State of Good Repair. This project will also include needed signal upgrades, including signal block length reductions, along with upgrades of grade crossing warning devices.	Empire South	Amtrak		Columbia, Dutchess	Track, Speed Improvements, State of Good Repair	Increase speed, reduce trip time	114	75	\$131,399,840
ESC-35	Hudson Line Speed Improvements Phase 2: CP-114 to CP-125	This project will straightening vertical and horizontal curves to permit higher speed, realign tracks to reduce curvature, increase spiral lengths, and increase superelevation in order to facilitate speed increases on sections of the Hudson Line. This project includes locations where realigned track curve corrections may require additional right-of-way. This project will also include surfacing and tie replacement to improve track resiliency, and keep the track within the higher maintenance standards required for 110 MPH operations. This project will also rehabilitate existing bridges to facilitate new track alignments, and comply with the track maintenance standards for operating at higher speeds. Within the curve realignment sections, the condition of the tracks and bridges will be brought to a State of Good Repair. This project will also include needed signal upgrades, including signal block length reductions, along with upgrades of grade crossing warning devices.	Empire South	Amtrak		Columbia	Track, Speed Improvements, State of Good Repair	Increase speed, reduce trip time	125	114	\$131,399,840
ESC-02	Hudson Line - Bridge Replacement Project	This project will replace 5 bridges on the Hudson Line (Mile Post 85.45 (Staatsburg), Mile Post 97.35 (Tivoli Bay), Mile Post 108.18 (Jansen Kill), Mile Post 118.30 (Stockport), Mile Post 118.58 (Stockport)) including replacing fixed decks with ballasted decks to remove/prevent speed restrictions, improving track geometry and bridge conditions to increase resiliency.	Empire South	Amtrak		Columbia, Dutchess	Structures	Resiliency, State of Good Repair, Speed Increases	118.58	84.45	\$302,730,000
ESC-47	Hudson Line New Signal System from CP 75 to CP 169	This project will install signalization to increase track capacity, including new signal houses and wayside signal equipment from Schenectady to Hoffmans and from Control Point 143, Rensselaer, to Poughkeepsie.	Empire South	Amtrak			Communication, Signaling, and Control	Operational Benefits, Safety	169	75	\$140,000,000
ESC-01	Livingston Avenue Bridge Replacement	This project will replace the Livingston Avenue Rail Bridge that spans the Hudson River between the cities of Albany and Rensselaer, fortifying a critical link for Passenger Rail Service in New York State. This bridge provides the only upstate New York passenger rail crossing of the Hudson River and is vital to connecting all points west from Niagara Falls to New York City by rail. The bridge was originally constructed in 1866 and has significant loading and speed restrictions. The new bridge will replace the deficient moveable bridge and improve safety, reliability, travel time. This project will also remove speed and weight restrictions imposed by the current structure, increase capacity and improving resiliency for passenger rail service.	Empire West	Amtrak	Albany, Rensselaer	Albany, Rensselaer	Bridge, Safety, State of Good Repair, Reliability	Safety, Capacity, State of Good Repair	143	143	\$400,000,000

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
ESC-33	Schenectady - Hoffmans Double Track	This project will construct a 2nd main track between Schenectady and Hoffmans, NY. This project includes bridge rehabilitation for three (3) undergrade bridges. This project will improve on time performance, reduce train delays, and add capacity.	Empire West	Amtrak	Schenectady, Pattersonville	Schenectady	Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	169	160	\$99,705,372
ESC-30	Empire Corridor Congestion Relief, Reconfigure CP 169	This project will reconfigure the junction of Empire Corridor with the CSX Selkirk Branch at CP169 (Hoffmans). Freight trains traveling west enter the Empire Corridor at CP 169 and exit to reach the CSX Selkirk Yard. Passenger trains servicing upstate cities including Syracuse, Rochester, Buffalo, and Niagara Falls, enter the Empire Corridor West from the Hudson Line at CP 169 and continue on to Albany and New York City when traveling south. This project includes the construction of an additional track along the 110 mph section of the Hudson Subdivision in Colonie, Albany County.	Empire West	Amtrak	Scotia	Schenectady	New or restored sidings/passing tracks	Reduce Delay, Add Capacity, Improve Operation	169	169	\$19,476,810
HSR-02	3rd Track - Hoffmans to Amsterdam (MP 169 to 179) and 4th track from MPs 170 to 174.	This project will construct new 3rd and 4th tracks between Hoffmans and Amsterdam. The project will include two new bridges, signal and interlocking work, embankment, retaining walls, drainage and erosion control measures. The project also includes 9 grade crossing upgrades/replacements. This project requires Right of Way acquisition.	Empire West	CSXT	Scotia, Schenectady, Amsterdam, Glenville	Montgomery, Schenectady	Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	174	160	\$382,037,326
EW-03	Amsterdam Station, Platform and Interlockings Project	This project will construct a new Amsterdam Station, new high level platform and new interlockings. This project will also include necessary drainage work, provide elevators and stairs to and from the station (vertical circulation), construct areas of refuge and emergency egress as required by code. This project will also rehabilitate and realign Tracks as necessary to accommodate the new platform footprint. This project will improve reliability and provide ADA compliant level boarding.	Empire West	CSXT	Amsterdam	Montgomery	Station, Platform, Track and Interlockings	Reduce Delay, Add Capacity, Improve Operation	178	178	\$16,755,174
HSR-03	3rd and 4th Track - Kellogg's Yard to Danascara Creek	This project will construct new 3rd and 4th track from Kellogg's Yard to Danascara Creek. (Mile Post 173.9 to Mile Post 183.5) This project also includes two new bridges at Mile Post 181- Mile Post 182 and at Danascara Creek, signal system improvements and interlockings, embankment, retaining walls, drainage and erosion control measures. This project also includes improvements at 15 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Tribes Hill, Fort Johnson, Amsterdam	Montgomery	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	184	174	\$247,677,837
HSR-04	3rd Track Fonda to Little Falls (Mile Post 184 to Mile Post 218) 4th Track from Mile Posts 204-214	This project will construct a new 3rd track from Fonda to Little Falls (MP 184 to MP 218). This project includes 17 new bridges, including bridges over Cayadutta Creek, Knauderack Creek, Mohawk River Creek, and a major structure at East Canada Creek. This project also includes signal and interlocking improvements, embankment, retaining walls and other structures, drainage, and erosion control measures. This project will also include upgrades to approximately 45 grade crossings. This project requires Right of Way acquisition.	Empire West	CSXT	Yost, Tribes Hill, Nelliston, Fonda, St. Johnsville, Palatine, Mohawk, Manheim, Little Falls	Herkimer, Montgomery	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	218	184	\$688,100,370

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
HSR-05	3rd Track, Little Falls to Herkimer, from Mile Post 218 to Mile Post 225.9.	This project will construct new 3rd track from Mile Post 218 to Mile Post 225.9. This project also Includes two new bridges, including a major structure at Mile Post 222.5 West Canada Creek. The project also includes new signals and interlockings, embankment, retaining walls and other structures, and drainage and erosion control measures. This project includes improvements at 5 grade crossing locations.	Empire West	CSXT	Herkimer	Herkimer	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	226	218	\$260,795,039
HSR-06	3rd Track, Herkimer to Utica, from Mile Post 226 to Mile Post 235	This project will construct new 3rd track from Herkimer to Utica, Mile Post 226 to Mile Post 235. The project also includes new signals and interlockings, embankment, retaining walls and other structures, and drainage and erosion control measures.	Empire West	CSXT	Herkimer, Frankfort, Utica	Herkimer, Oneida	Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	226	235	\$105,000,000
EWC-26	Utica Station -Track, Interlocking, High Level Platform, Vertical Circulation	This project will construct new high-level side platforms, and realign the tracks at Utica Station. This project will also include necessary drainage work, provide elevators and stairs to and from the station (vertical circulation), construct areas of refuge and emergency egress as required by code. This project will also rehabilitate and realign tracks as necessary to accommodate the new platform footprint. This project will improve reliability and provide ADA compliant level boarding.	Empire West	CSXT	Utica	Oneida	Station, Platform, Track and Interlockings	Reliability, Safety, Reduce Trip Time	238	238	\$10,288,010
HSR-07	3rd and 4th Tracks, Utica to Yorkville from Mile Post 235 to Mile Post 239.1	This project will construct new 3rd and 4th track from Utica to Yorkville (Mile Post 235 to Mile Post 239.1). This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage, and erosion control measures.	Empire West	CSXT	Utica	Oneida	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	239	235	\$121,660,766
HSR-08	3rd Track, Yorkville to Whitestown, from Mile Post 239 to Mile Post 246.	This project will construct new 3rd tracks from Yorkville to Whitestown (Mile Post 239 to Mile Post 246). This project includes 4 new bridges, signal improvements, new interlockings, embankment, retaining walls and other structures, drainage, and erosion control measures. This project also includes upgrades at 2 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Whitestown	Oneida	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	246	239	\$94,023,813
EWC-05	Mohawk Valley Empire Corridor Congestion Relief (Control Point 175, Control Point 239 and Control Point 248) Amsterdam to Solvay (Mile Post175 to Mile Post 294)	This project will improve travel times, operational capacity, and safety for intercity passenger trains and freight trains by upgrading signals, control points, and interlockings along approximately 76 miles of the Selkirk and Mohawk Subdivisions.	Empire West	CSXT	Utica, Amsterdam	Herkimer, Montgomery, Oneida	Communication, Signaling, and Control	Reduce Delay, Add Capacity, Improve Operation	251	169	\$16,589,691

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
EWC-27	Rome Station - Track, Interlocking, High Level Platform, Vertical Circulation	This project will construct new high-level platform and new interlockings. This project will also include necessary drainage work, provide elevators and stairs to and from the station (vertical circulation), construct areas of refuge and emergency egress as required by code. This project will also rehabilitate and realign tracks as necessary to accommodate the new platform footprint. This project will improve reliability and provide ADA compliant level boarding.	Empire West	CSXT	Rome	Oneida	Station, Platform, Track and Interlockings	Reliability, Safety, Reduce Trip Time	251	251	\$6,429,863
HSR-09	3rd Track Rome to Verona, from Mile Post 246 to Mile Post 259	This project will construct a new 3rd track from Rome to Verona (Mile Post 246 to Mile Post 259). This project includes 7 new bridges including bridges over the Mohawk River. The project includes signal improvements and new interlockings, embankment, retaining walls and other structures, drainage, and erosion control measures. This project also includes upgrades to 5 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Rome, Verona	Oneida	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	259	246	\$231,893,570
HSR-10	3rd Track Verona to Lenox, from Mile Post 259 to Mile Post 283	This project will construct a new 3rd track from Verona to Lenox, Mile Post 259 to Mile Post 283. This project includes 10 new bridges, including Oneida Creek and a Flyover at DeWitt Yard. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage and erosion control measures. This project also includes upgrades at 12 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Verona, Sullivan, Manlius, Lenox	Madison, Oneida, Onondaga	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	283	259	\$520,104,607
EWC-40	Syracuse Congestion Relief (Multiple Phases)	This project will increase capacity by providing additional freight capacity between DeWitt and Belle Isle Pocket Yard. This project will add track capacity in the vicinity of Syracuse Station and reconfigure signals at the station including new interlockings. This project will also replace the bridge over Park Street with multiple bridges capable of carrying 5 tracks. This project will construct a new high level platform capable of allowing two trains to service the station at the same time at Syracuse Station.	Empire West	CSXT	Syracuse	Onondaga	New Track, Signals, Interlockings, New Platform, Vertical Circulation	Operational Benefits, Safety	294	290	\$150,000,000
HSR-11	3rd Track Salina to Camillus, Mile Post 283 to Mile Post 310, 4th Track between Mile Post 301 to Mile Post 309	This project will construct a new 3rd track from Salina to Camillus (Mile Post 283 to Mile Post 310) and a new 4th track from Werners to Jordan (Mile Post 301 to Mile Post 309). This project includes 9 new bridges. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage and erosion control measures. This project also includes upgrades at 6 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Salina, DeWitt (De Witt), Camillus	Onondaga	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	310	283	\$620,883,861
HSR-12	3rd Track Weedsport to Wayneport, Mile Post 310 to Mile Post 359	This project will construct a new 3rd track from Weedsport to Wayneport (Mile Post 310 to Mile Post 359). This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage and erosion control measures.	Empire West	CSXT	Camilus/Fox Ridge	Onondaga	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	310	359	\$547,430,000
HSR-14	2nd Track Palmyra to Rochester from Mile Post 347.4 to Mile Post 368.8	This project will install new 2nd track from Palmyra to Rochester, Mile Post 347.4 to Mile Post 368.8. This project also includes 7 new bridges. This project includes new interlockings, embankment, retaining walls and other structures, and drainage and erosion control measures. This project also includes upgrades at 11 grade crossing locations.	Empire West	CSXT	Pittsfield, Perinton, Henrietta, Chili, Brighton	Monroe	New Track, Signals, Interlockings	Operational Benefits	369	348	\$297,014,182

Project Number	Project Name	Project Description	Corridor	Operator	City/Town	Counties	Project Type	Goals	To Mile Post	From Mile Post	Estimated Cost (\$2017)
HSR-15	3rd Track Fairport to Brighton from Mile Post 359 to Mile Post 373	This project will construct new 3rd track from Fairport to Brighton (Mile Post 359 to Mile Post 373). This project also includes 9 new bridges. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage and erosion control measures. This project also includes upgrades at 2 grade crossing locations. This project requires approximately 20 acres of Right of Way acquisition.	Empire West	CSXT	Fairport, Rochester, Perinton, Brighton	Monroe	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	373	359	\$638,720,261
HSR-16	3rd Track and 4th Track Rochester from MP 373 to 374.3	This project will construct new 3rd and 4th tracks in Rochester from Mile Post 373 to Mile Post 374.3. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage and erosion control measures.	Empire West	CSXT	Rochester	Monroe	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	374	373	\$30,129,452
HSR-17	3rd Track Churchville to Gates from MP 374.3 to MP 388	This project will construct a new 3rd track from Churchville to Gate (Mile Post 374.3 to Mile Post 388). This project includes 6 new bridges. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage, and erosion control measures. This project also includes upgrades to 11 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Churchville, Rochester, Gates	Monroe	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	388	374	\$298,048,055
HSR-18	3rd Track Gates to Bergen from MP 388 to 399	This project will construct 3rd track from Gates to Bergen (Mile Post 388 to Mile Post 399). This project includes 1 new bridge. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage, and erosion control measures. This project also includes upgrades to 10 grade crossing locations. This project also requires Right of Way acquisition.	Empire West	CSXT	Churchville, Byron, Bergen	Genesee, Monroe	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	399	388	\$235,307,988
EWC-34	New Buffalo-Depew Station, Track, Interlocking, High Level Platform, Vertical Circulation	This project will construct a new Buffalo Depew Station, and new high-level platform and new interlockings. This project will also include necessary drainage work, provide elevators and stairs to and from the station (vertical circulation), construct areas of refuge and emergency egress as required by code. This project will also rehabilitate and realign tracks as necessary to accommodate the new platform footprint. This project will improve reliability and provide ADA compliant level boarding.	Empire West	CSXT	Depew	Erie	Station, Platform, Track and Interlockings	Reliability, Safety, Reduce Trip Time	431	431	\$9,001,578
HSR-19	3rd Track Corfu to Batavia from MP 399 to MP 432	This project will construct a new 3rd track from Corfu to Batavia (Mile Post 399 to Mile Post 432). This project also includes 15 new bridges. This project includes signal improvements, new interlockings, embankment, retaining walls and other structures, drainage, and erosion control measures. This project also includes upgrades to 38 grade crossing locations. This project requires Right of Way acquisition.	Empire West	CSXT	Corfu, Alden, Lancaster, Darien, Batavia	Erie, Genesee	New Track, Signals, Interlockings	Reduce Delay, Add Capacity, Improve Operation	432	399	\$751,299,121
HSR-20 (EWC-17)	Niagara Branch Double Track	This project will construct 2nd track on the Niagara Branch in Buffalo from Mile Post QDN 2 to Mile Post QDN 7 and from Buffalo to North Tonawanda, Mile Post QDN 17 to Mile Post QDN 22.8. This project includes signal improvements, new interlockings, embankment, retaining walls or other structures, drainage, and erosion control measures. Re: High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Dear Mr. Kassof:

The Federal Railroad Administration (FRA), in cooperation with the New York State Department of Transportation (NYSDOT), is preparing a Tier 1 Environmental Impact Statement (EIS) that will study and document proposed improvements to intercity passenger rail services along the 463-mile Empire Corridor, beginning at Penn Station in New York City, New York County and proceeding north to Poughkeepsie (Dutchess County) and Albany (Albany County) then turning west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County) and terminating at Niagara Falls (Niagara County).

The objective is to make corridor level decisions regarding the level of intercity passenger rail service provided in the corridor, including, among other factors, variations in train frequency, trip time, and on-time performance. Alternatives that improve the on-time performance and increase the average operating speeds up to a maximum authorized speed (MAS) of 110 mph for passenger rail will be evaluated.

FRA is the lead Federal agency and the New York Department of Transportation is the joint lead state agency for this project. The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. The initial phase ("Tier 1 EIS") of this process will address broad rail service issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, site-specific projects encompassed by the decisions made in Tier 1. The EIS will be developed pursuant to the National Environmental Policy Act of 1969 (NEPA), as amended, 42 U.S.C. 4321 et seq., the Council on Environmental Quality NEPA implementing regulations, 40 CFR parts 1500-1508, FRA NEPA procedures, 64 FR 28545 (May 26, 1999), and the New York State Environmental Quality Review Act (SEQR).

FRA is, in accordance with 40 C.F.R. 1501.6, requesting the involvement of the US Coast Guard (Coast Guard) as a cooperating agency with a focus on those areas within Coast Guard jurisdiction.

As a cooperating agency pursuant to NEPA, your involvement in the preparation of the EIS may include the following activities:

1. Assist in identifying interest groups;
2. Participate in coordination meetings;
3. Raise concerns about any relevant technical studies that may be needed for the project;
4. Provide information on alternatives;
5. Assist the lead agency in determining appropriate and practicable mitigation. These measures should reflect avoidance, minimization, and compensation;
6. Review pre-draft and pre-final environmental documents and comment as early as practicable on environmental and socioeconomic resources located within the project area, particularly sections relevant to the Coast Guards purview;
7. Identify issues, concerns and any technical studies that the EIS should address to support the Coast Guard in fulfilling its NEPA or other responsibilities and any other requirements regarding jurisdictional permits and/or other approvals.

We look forward to your response to our request to be a cooperating agency, and to working with you to advance this project. The favor of a reply is requested by May 27, 2011.

If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact Colleen Vaughn of my staff at colleen.vaughn@dot.gov or (202) 493-6096, or myself at (202) 493-6368. The NYSDOT project manager for the Empire Corridor Tier 1 EIS is David Chan, who can be reached via phone at (518) 485-1918 or email at dchan@dot.state.ny.us.

Sincerely,

David Valenstein
Division Chief
Environment and Systems Planning

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency confirm your prior decision to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to

environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and

7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

A handwritten signature in cursive script that reads "Marie Corrado".

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address

broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project may require a permit or approval from your agency, we request your agency to be a cooperating agency.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Request your review of relevant sections of the DEIS prior to its release for comment by the public and other agencies.
6. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
7. Include information in the project environmental documents that cooperating agencies need to discharge their NEPA responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process, the EIS and our public involvement process will satisfy your NEPA requirements, as applicable, including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and FRA's subsequent record of decision as our decision-making documents and as the basis for the permit application.

Public Involvement: Scoping meetings will be held from **5:30 to 7:30 pm** in Buffalo, Rochester, Syracuse, Utica, Albany, and New York City, in late October and early November. We encourage you to attend. A Scoping Information Package will be available in the days ahead.

A public hearing will be held after publication of the Tier 1 DEIS to obtain comments on that document. Public notice will be given prior to the hearing regarding its time and location and process for submitting comments.

We look forward to your comments and response to this request and your participation as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be or will not be a cooperating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

**Re: High Speed Rail Empire Corridor Project Tier 1 EIS New York City to
Buffalo/Niagara Falls – PIN S937.51.171**

Dear Mr. Chan:

This is in response to your October 7, 2010 letter requesting that the Environmental Protection Agency (EPA) serve as a cooperating agency for the High Speed Rail Empire Corridor Project Tier 1 Environmental Impact Statement. EPA is pleased to accept the New York State Department of Transportation's (NYSDOT) offer. As such, we will continue to participate in the scoping process, assist with the development of information and analyses concerning EPA areas of expertise, and contribute staff time as appropriate, all to the level practicable. If NYSDOT has particular analyses or support in mind at this time, EPA would appreciate being made aware of those as soon as possible so we can make every effort to align our resources accordingly.

We would like to remind you that our participation does not preclude our review under the National Environmental Policy Act and comment authority under Section 309 of the Clean Air Act. Lingard Knutson will remain the contact person for this project. Her phone number is (212) 637-3747.

Sincerely yours,

A handwritten signature in cursive script, reading "Grace Musumeci", is written over a horizontal line.

Ms. Marie Corrado
Director of Major Projects
New York State Department of Transportation
50 Wolf Road
Albany, NY 12232

Dear Ms. Corrado:

This responds to your letters of 07 October 2010 concerning Project I.D. No. S937.51.171, High Speed Rail Empire Corridor Project.

The Coast Guard will agree to be a cooperating agency under the terms related in your Tier 1 Environmental Impact Statement letter. We expect that all navigational and other concerns will be addressed under appropriate sections of the environmental impact statement.

I had the pleasure of meeting with David Chan and Benjamin Martin from NYSDOT at the October 27, 2010 Public Meeting held in New York City. I discussed with them our interests in this project in regards to impacts to navigation due to construction of new bridges or modifications to existing bridges over navigable waters of the United States. As segments of this proposed project may fall under Coast Guard regulatory jurisdiction, we must decline your invitation to be a member of the Empire Project Advisory Committee (EPAC). However, we remain available to provide navigational related information as necessary.

Chris Bisignano of this office has been assigned as project manager and may be contacted at (212) 668-7994 for specifics regarding Coast Guard Bridge permitting requirements.

Sincerely,

A handwritten signature in black ink, appearing to read "Gary Kassof".

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity

transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Marie Corrado

Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity

transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Marie Corrado

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train

service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity

transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Marie Corrado
Director of Major Projects

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train

service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Marie Corrado

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity

transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train service in order to attract additional passengers and be more competitive with other intercity

transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Marie Corrado

Re: PIN S937.51.171, High Speed Rail Empire Corridor Project
Tier 1 Environmental Impact Statement
New York City to Buffalo/Niagara Falls

Ladies and Gentlemen:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is initiating development of a Tier 1 Service Level Environmental Impact Statement (EIS) of proposed improvements to intercity passenger rail service along the Empire Corridor between New York City, New York and Niagara Falls, New York. The 463-mile Empire Corridor begins at Moynihan/Pennsylvania (Penn) Station in New York City (New York County), proceeds north to Yonkers and Croton-Harmon (Westchester County), Poughkeepsie (Dutchess County) and Albany-Rensselaer (Albany County), then turns west to Schenectady (Schenectady County), Utica (Oneida County), Syracuse (Onondaga County), Rochester (Monroe County), Buffalo (Erie County), and terminates at Niagara Falls (Niagara County).

Environmental Review Process: The Environmental Impact Statement (EIS) will be developed in accordance with the National Environmental Policy Act of 1969 (NEPA), the environmental review provisions of Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and the New York State Environmental Quality Review Act (SEQR). The FRA and the NYSDOT will use a tiered process, as provided for in 40 CFR 1508.28, in the completion of the environmental review of the project. "Tiering" is a staged environmental review process applied to environmental reviews for complex projects. The initial phase ("Tier 1 EIS") of this process will address broad service-level issues and proposals. Subsequent phases or tiers will analyze, at a greater level of detail, narrower site-specific proposals based on the decisions made in Tier 1.

Scope of Agency Involvement: Issues that will be analyzed at the service level in this Tier 1 EIS include ways to introduce travel speeds of at least 110 mph in places along the Empire Corridor where those speeds are not possible, and to improve the reliability, travel times and frequency of passenger train

service in order to attract additional passengers and be more competitive with other intercity transportation modes. The project will establish specific goals for train frequency, trip time, and on-time performance and identify operational changes and investments in infrastructure and equipment necessary to achieve those goals. The EIS will address the project's potential effects on noise, air, water quality, and cultural and recreational resources, as well as other social, economic and environmental effects. A result of the Tier 1 EIS will be identification of further analysis required in Tier 2 NEPA document(s) for specific improvement projects.

As part of the process for determining the scope of issues to be addressed in the Tier 1 Draft Environmental Impact Statement and for identifying the important issues related to the proposed action, we request your comments on the above issues and any other issues that you can identify as important. We intend to use your comments to:

- Identify the range of alternatives and impacts and important issues to be addressed in the Environmental Impact Statement.
- Identify and eliminate from detailed study the issues which are not important or which have been covered by prior environmental review.
- Identify other environmental review and consultation requirements.

Since the project might impact resources your agency is involved with, we request your agency to be a participating agency. Pursuant to Section 6002 of SAFETEA-LU, participating agencies are responsible to identify, as early as practicable, any issues of concern regarding the project's potential impacts.

We expect your agency's involvement to entail only those areas under its jurisdiction or expertise and no direct writing or analysis will be necessary for the document's preparation. The activities we will take to maximize interagency cooperation may include the following:

1. Invite you to participate in scoping meetings and other meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Provide meaningful and timely input.

We look forward to your comments and response to this request and your role as a participating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact David Chan or the Project team via empirecorridor@dot.state.ny.us. Please forward any initial comments and confirmation that you will be a participating agency to us by October 15, 2010. E-mail replies should be sent to David Chan at NYSDOT at empirecorridor@dot.state.ny.us.

Sincerely,

Marie Corrado
Director of Major Projects

Hi Lindsay- Thank you for sending the invitation and newsletter. I will be attending the meeting on Monday, October 18th to represent CDTA as a participating agency throughout the EIS process. We have been working closely with NYSDOT on this and CDTA's Schenectady station project, and look forward to working on the advancement of high speed rail in the corridor.

Thank you,

Jennifer

Please find attached two separate invitation letters: 1) to join the High Speed Rail Empire Corridor Project Advisory Committee, and 2) to become a participating agency. The first EPAC meeting will be held on October 18th, 2010 and we hope to see you there.

To facilitate our first meeting on Monday, October 18th, attached is an advance copy of Newsletter 1. This four-page document provides you with an overview of the project, as well as the dates and locations of the upcoming Scoping Meetings. Six meetings will be held across New York State from October 19th to November 10th.

We look forward to working together on this important project.

Mr. Chan,

I received the letter from Marie Corrado requesting participation. I would be glad to participate. I am in Erie County's Office of Economic Development which is within the Department of Environment and Planning. We have tried to combine the various aspects of Planning, Community and Economic Development together. Transportation Planning has been a part of this effort. We also handle the two shortline rail lines that the County owns.

I plan on attending the Buffalo session on Tuesday October 19th. Our primary comment will be the same one we stated in the NYS Rail Plan which was prepared a short time ago, that is: dedicated passenger track, first and foremost. Everything else hinges on that.

I look forward to working with you and your group.

Ken Swanekamp

Subject: GTC as Participating Agency on Empire Corridor High-Speed Rail EIS

Dear Mr. Chan:

This e-mail serves as confirmation that the Genesee Transportation Council (GTC) would like to serve as a participating agency in the development of the Environmental Impact Statement (EIS) for the Empire Corridor high-speed passenger rail project. As a note, GTC informed the NYS Department of Transportation (NYSDOT) of our interest in serving as an "involved" agency for the development of the Tier 1 EIS on September 15, 2009 via an e-mail to then-project manager Ann Purdue.

Attached are comments that GTC developed in October 2009 in response to the *Federal Register* notice of September 24, 2009 requesting comments on the Tier 1 EIS. We feel that these topics are still relevant and do not have additional comments at this time.

Please contact me at your convenience if you have any questions. I may be reached by telephone at (585) 232-6240 or via e-mail at rperrin@gtcmpo.org.

Thank you for the opportunity to participate in this important initiative.

Sincerely,
Rich

Good afternoon Christina,

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

In order to complete the Tier 1 EIS, the project team will be reviewing available data. At this time, we respectfully request any Geographic Information System data regarding parks that have received Land and Water Conservation Funding along or within ½ mile of the 463 mile corridor (Figure 1). While geographic information systems (GIS) data is preferred, any mappable data your office could provide would be greatly appreciated. As I understand it, GIS mapping of municipal parks that have received Land and Water Conservation Funding is available for our use.

If you have any questions, please feel free to contact me.

Best regards,

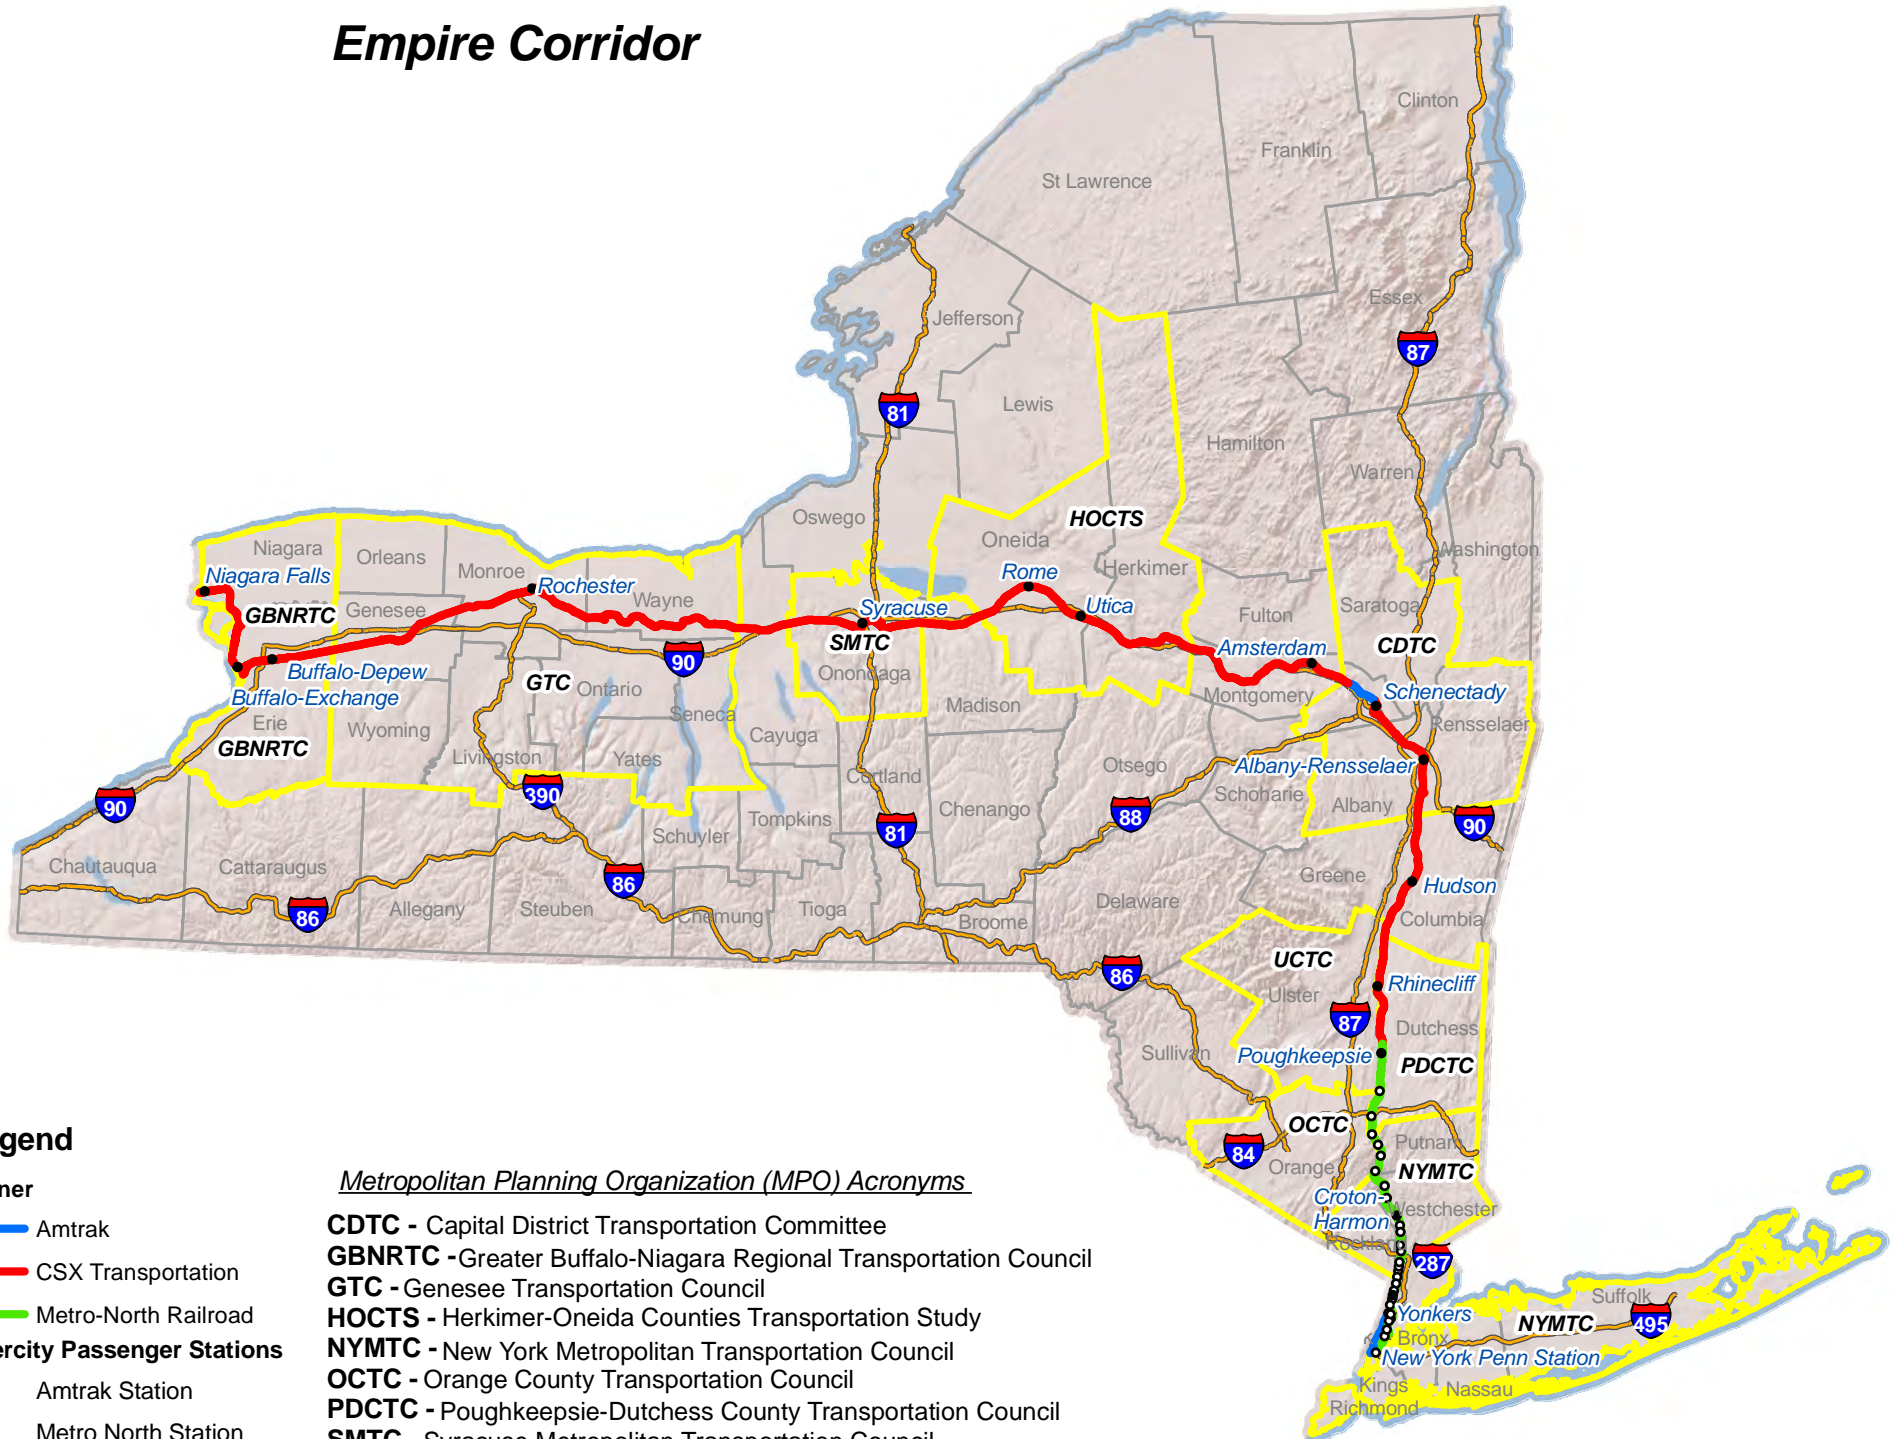

Addie

Subject: Spills Data Request
Attachments: Project_Centerline.zip; centerline_halfmile_buffer.zip; Corridor Map_July 28 2010 (2).pdf

Dear Ms. Zuck,

Thank you for taking the time to speak to me today. Below is further information about the project and a formal request for data. I've also attached our Shape files of the project centerline and ½ mile buffer as well as a general map of the corridor. As discussed, it would be very helpful if you could provide me with any GIS data and the link to the FTP site.

Data request and project information:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

In order to complete the Tier 1 EIS, the project team will be reviewing available data. At this time, we respectfully request any Geographic Information System data regarding Spills incidents along or within a ½ mile of the 463 mile corridor (Figure 1). While geographic information systems (GIS) data is preferred, any mappable data your office could provide would be greatly appreciated.

Please feel free to contact me if you have any questions. Thank you.

Subject: Information Request for High Speed Rail Empire Corridor Project (PIN S937.51.171)

Dear Mr. Kassof:

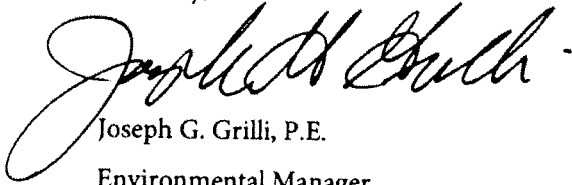

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

Per previous correspondence with NYSDOT, the U.S. Coast Guard has agreed to be a cooperating agency for the Tier 1 EIS. We respectfully request information on navigational/regulatory issues of concern related to the waterways along the project route (see the attached project location and base maps and Major Streams and Rivers table). We are requesting information on which of the waterways in the project area are under federal jurisdiction for navigation, so these may be considered in the environmental inventory and Tier 1 EIS. We would also like to request a copy of the existing USCG bridge permit(s), as appropriate. Information regarding plans for dredging is also requested.

If you have any questions, please feel free to contact me at (617) 532-2244 or jgrilli@hntb.com.

Subject: Information Request for High Speed Rail Empire Corridor Project (PIN S937.51.171)

Dear Ms. Colligan:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

NYSDOT has previously corresponded with your agency to notify you of the project. We are now writing to inquire about species protected under Section 7 of the United States Endangered Species Act and critical habitats designated under Section 7 that may be present in the project area (Figure 1). We would also like to request information in digital (GIS or other electronic mapping) files showing the location of any such species. For your reference, a list of major streams and rivers located within 300 feet of the track centerline are included as Attachment A (please note, the attached list is not a comprehensive list of all water-bodies within the project area).

If you have any questions, please feel free to contact me at (617) 532-2244 or jgrilli@hntb.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Joseph G. Grilli". The signature is fluid and cursive, with a large initial "J" and "G".

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

NYSDOT has previously corresponded with your agency to notify you of the project. We are now writing to inquire about Essential Fish Habitats protected under the U.S. Magnuson-Stevens Fishery Conservation and Management Act and anadromous fisheries in the Hudson River that may be present in the project area (Figure 1). We would also like to request information in digital (GIS or other electronic mapping) files showing the location of any such species. For your reference, a list of major streams and rivers located within 300 feet of the track centerline are included as Attachment A (please note, the attached list is not a comprehensive list of all water-bodies within the project area).

If you have any questions, please feel free to contact me at (617) 532-2244 or jgrilli@hntb.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Joseph G. Grilli". The signature is fluid and cursive, with the first name "Joseph" being the most prominent part.

Joseph G. Grilli, P.E.

Albany, New York 12233-4756

Subject: Information Request for High Speed Rail Empire Corridor Project (PIN S937.51.171)

Dear Mr. Jacobson:

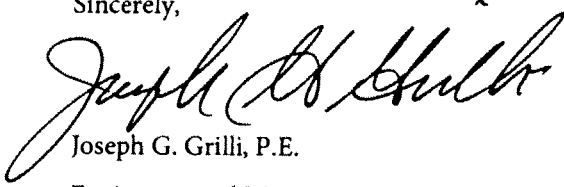

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

NYSDOT has previously corresponded with your agency to notify you of the project. We are now writing to request digital (GIS or other electronic mapping) files regarding wild and scenic rivers along or within 300 feet of the 436 mile corridor (Figure 1).

If you have any questions, please feel free to contact me at (617) 532-2244 or jgrilli@hntb.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Joseph G. Grilli". The signature is fluid and cursive, with a small "h" at the end.

Joseph G. Grilli, P.E.

NY Natural Heritage Program-Information Services
625 Broadway, 5th Floor
Albany, NY 12233-4757

Subject: Information Request for High Speed Rail Empire Corridor Project (PIN S937.51.171)

Dear Ms. Salerno:

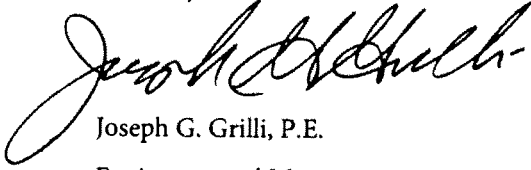

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

NYSDOT has previously corresponded with your agency to notify you of the project. We are now writing to request digital (GIS or other electronic mapping) files regarding "significant natural communities" and other areas protected by regulation, federally- and state-threatened, endangered, or other species of special concern, available for the 463 mile corridor (Figure 1 and Base Maps).

If you have any questions, please feel free to contact me at (617) 532-2244 or jgrilli@hntb.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Joseph G. Grilli". The signature is fluid and cursive, with the first name "Joseph" being more prominent and the last name "Grilli" following in a similar style.

Cc: 'Jakubiak, Mark (DOT)'; Kenneth Wasserman; Joe Grilli; Marissa Seifert; Robert Conway
Subject: FW: Empire Corridor GIS request
Attachments: nynhp_docgis_11n.doc; HNTB-NYNHP.zip

Hi Nick,

Thanks for your response! I am forwarding the shapefiles that we had received previously from NYNHP (along with email correspondence received below). Please note that this NYNHP zipfile had to be renamed as "HNTB" to clear our email server. We will send a separate email with the shapefiles for Empire Corridor alternatives. We had originally requested buffers of ½ mile, although NYNHP screening distances for some species exceed these buffers (e.g., Indiana bat, Timber rattlesnake).

The Tier 1 Draft EIS evaluated a range of alternatives: the Base (No Build), 90 mph alternatives (Alternatives 90A and 90B), 110 mph alternative (Alternative 110), and 125 mph alternative (Alternatives 125). The routes for Alternatives 90A, 90B, and 110 all follow the existing Empire Corridor, and the 125 mph corridor followed a new alignment west of Schenectady to Buffalo, merging in with the existing alignment in the major cities of Rochester and Syracuse. South of Albany, all of the alternatives follow the existing Empire Corridor extending along the Hudson Line to New York City.

The Tier 1 Final EIS currently in preparation identifies one of the 90 mph alternatives (Alternative 90B) as the Preferred Alternative. This is the final route for the Tier 1 analysis and will follow the existing Empire Corridor. Although at this time we had proposed updating the analysis (that will be presented in an Appendix G) of all of the other alternatives. The design for the Preferred Alternative will be refined in the Tier 2 analysis.

The Preferred Alternative (Alternative 90B) follows the route for the existing Empire Corridor, shown in green below. Alternative 125 was dismissed based on substantially greater impacts and costs and follows a new alignment, allowing for higher speed rail operations. The 125 mph Alternative is shown below in red and obscures the existing Empire Corridor (and 90 mph alternative) where it follows this route south of Albany to New York City. The below maps of our online GIS mapping show the entire route (with 125 in red and 90 mph alternative in green) along with NYNHP data of rare species (plants and animals) and significant natural communities and there is a closeup view of this data for the areas surrounding Syracuse.

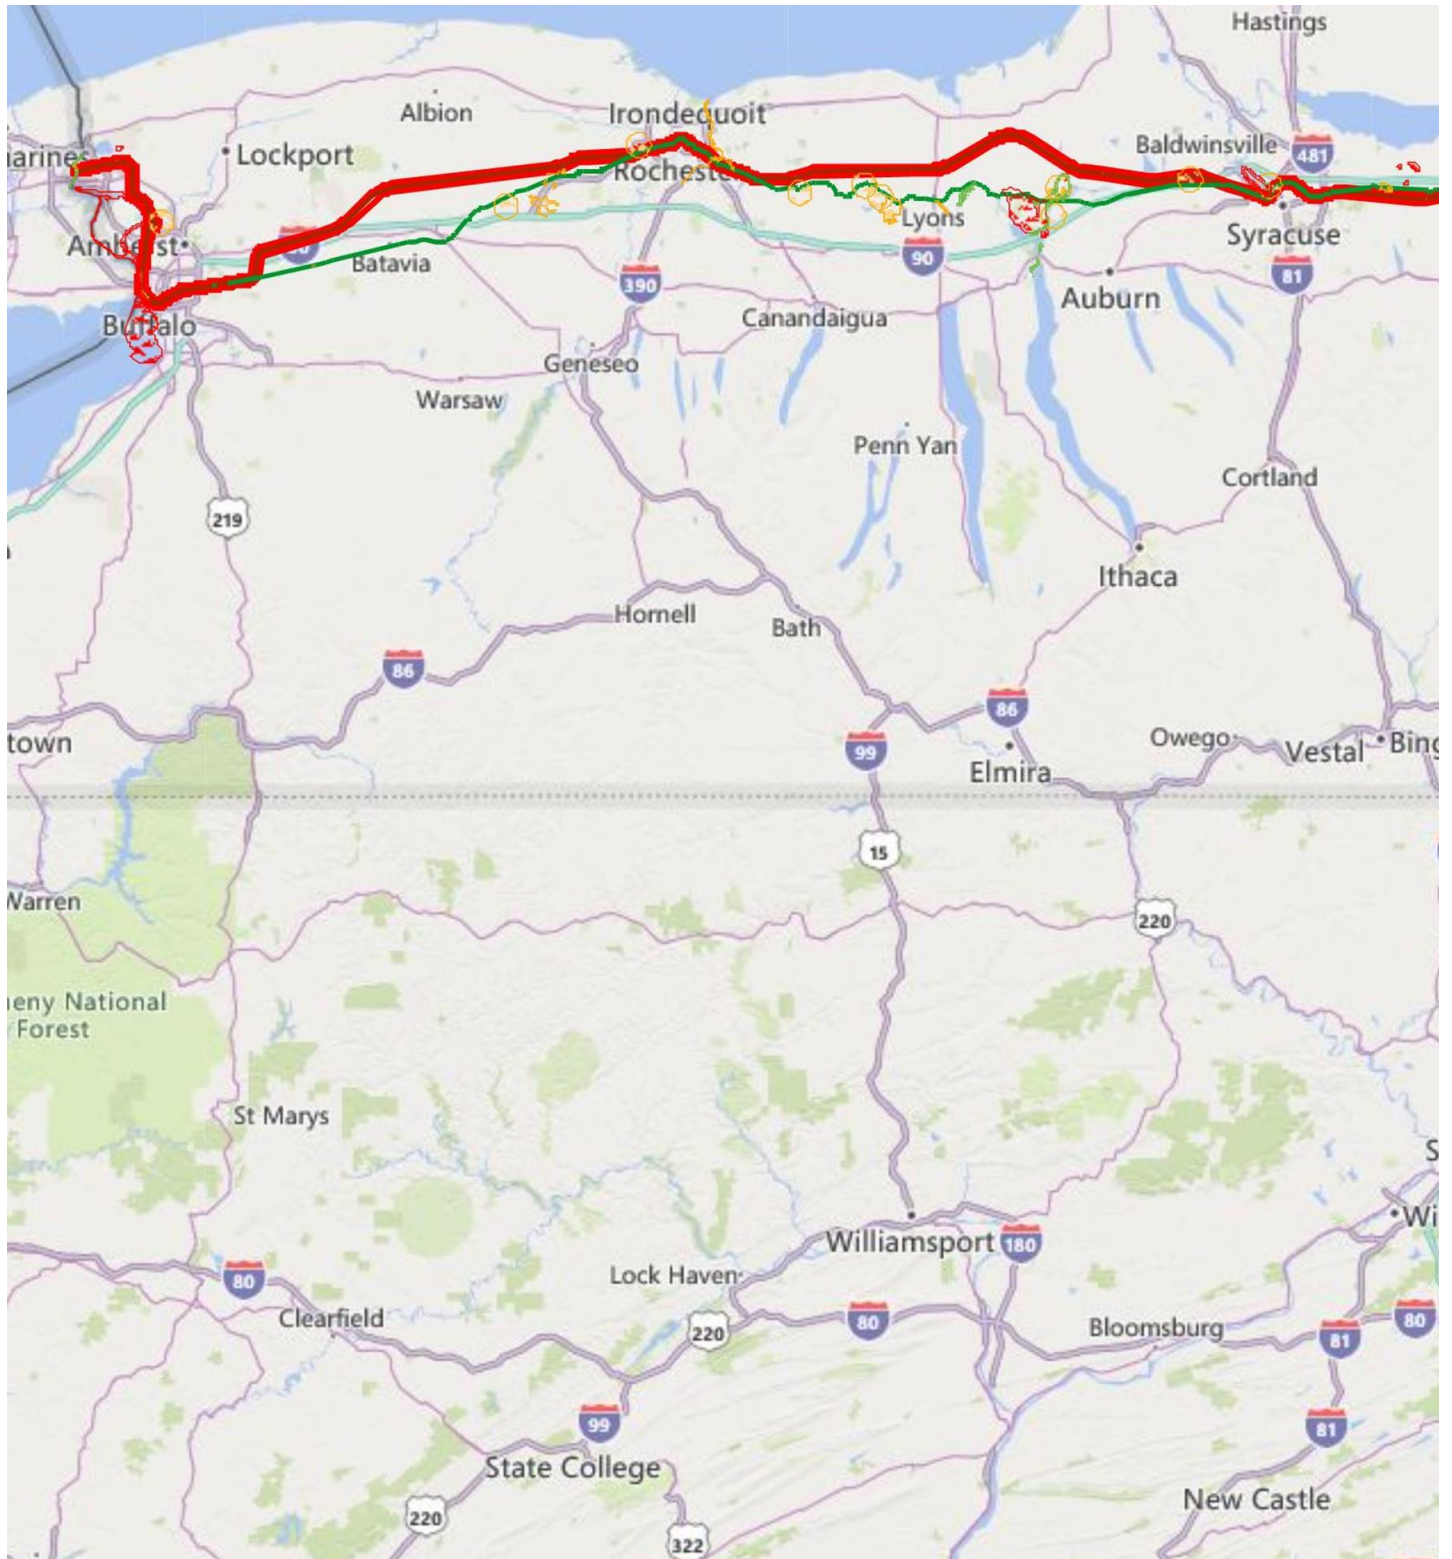

Sincerely,

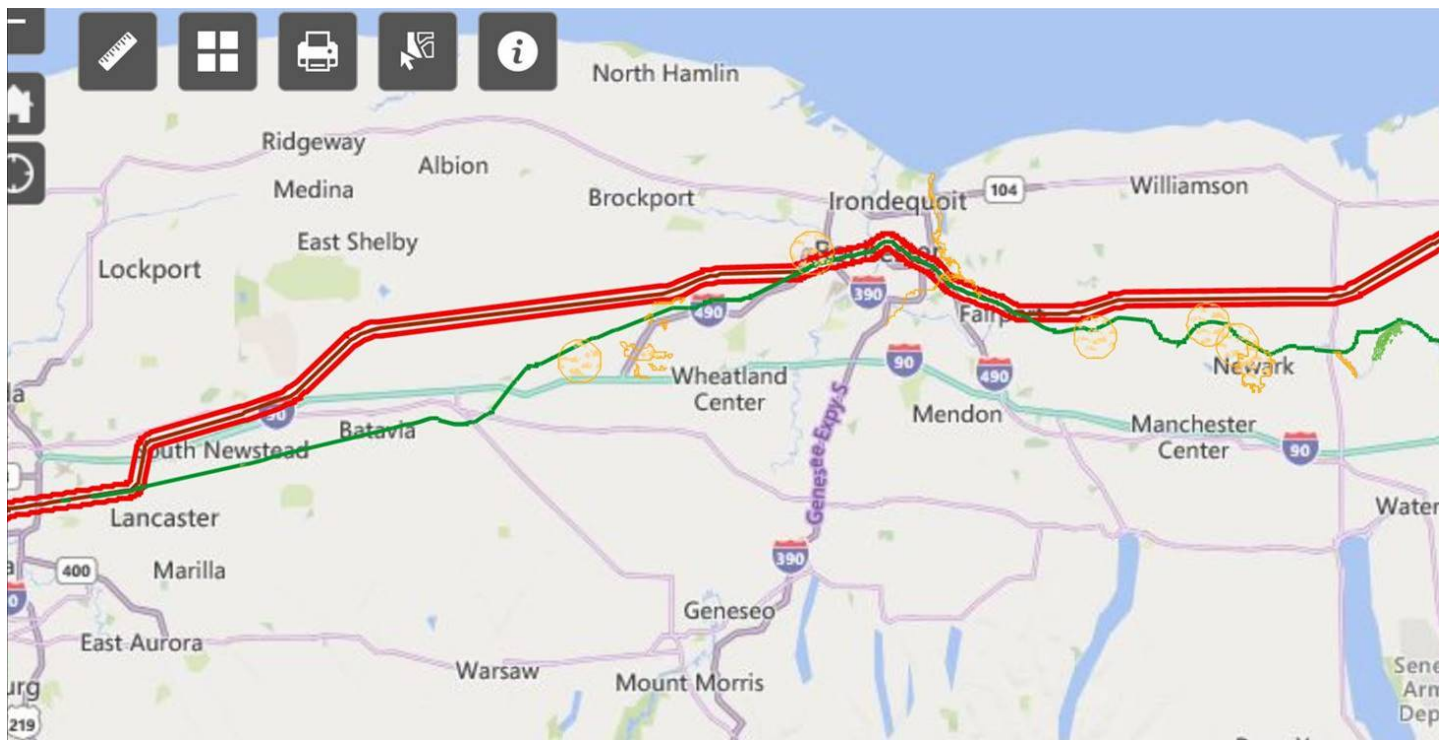

Addie

Subject: RE: Empire Corridor GIS request

Hi Karen,

Please find attached a zip file containing three shapefiles. The shapefiles contain locations of rare species and significant natural communities which are documented within 0.5 mile of the New York Power State Empire Corridor Project. In the shapefiles, each location is represented as a shape (one or more polygons). Some locations may have more than one overlapping shape, indicating more than one rare species or community occurs at that location. See the attached documentation, **nynhp_docgis_11n.doc**, for more details on interpreting these shapes and for definitions of the data fields.

The shapefiles are in meters, UTM zone 18, NAD 83.

The shapefile **nynhp_EmpireCorridor_species_11** contains records of rare plants and rare animals last documented since 1980, and for which relatively precise locations are known.

The shapefile **nynhp_EmpireCorridor_potential_11** contains records of rare plants and rare animals either last documented before 1980 (historical records), and/or records for which precise or relatively precise locations are not known. For historical records, there is no recent information and their current status is unknown. If appropriate habitat for these plants or animals is present, it is possible they may still be present.

The shapefile **nynhp_EmpireCorridor_comms_11** contains records of significant natural communities. Natural community occurrences in this shapefile are all ranked as being of excellent or good quality, and/or are considered significant from a statewide perspective. By meeting specific, documented criteria, the NY Natural Heritage Program considers these occurrences to have high ecological and conservation value.

Please note: In addition to the rare species provided in the shapefiles the following species have been documented within the given distances from the project site. These species are known to move the indicated distances and so potentially may be found near the project site at some time.

1. Indiana bats (*Myotis sodalis*) have been documented within 2 miles of the project site and occur in the following counties & towns:

Onondaga – Manlius

2. Timber rattlesnakes (*Crotalus horridus*) have been documented within 1.5 miles of the project site in the following counties & towns:

Putnam – Philipstown

For descriptions of each of the ecological community types, please go to <http://www.dec.ny.gov/animals/29384.html> and click on DRAFT Ecological Communities of New York State. More detailed information about many of the natural community types in New York, including identification, dominant and characteristic vegetation, distribution, conservation, and management, is available online in Natural Heritage's Conservation Guides at www.acris.nynhp.org.

More detailed information about many of the rare and listed animals and plants in New York, including biology, identification, habitat, conservation, and management, are available online in Natural Heritage's Conservation Guides at www.acris.nynhp.org, from NatureServe Explorer at <http://www.natureserve.org/explorer>, from NYSDEC at <http://www.dec.ny.gov/animals/7494.html> (for animals), and from USDA's Plants Database at <http://plants.usda.gov/index.html> (for plants).

Please confirm that you have received the data and let me know if you have any questions.

Thanks,

Tara

Hi Karen,
As discussed on the phone, as part of receiving data in digital format from the NY Natural Heritage Program, we ask that you also agree to and sign a data sharing agreement. A draft agreement is attached. If there are any provisions that raise concerns or questions for you, please let me know. If the provisions are acceptable, let me know that by e-mail, too, and return a signed copy to me in the mail or by e-mail (scanned in signed copy). Upon hearing that the

agreement is acceptable, we will prepare shapefiles of the locations of rare animals, rare plants, and significant natural communities which are documented in the NY Natural Heritage databases as occurring in the New York State Empire Corridor.

Let me know if you have any questions.

Thanks,
Tara

Hi Tara,

A few more questions.

1. Does your program handle the Hudson River Superfund Site? It appears from the NYSDEC website that it does but, I'm not 100% certain. I need to find hazardous waste information for the site..any ideas who to contact about that?
2. Also, I know you mentioned that you have record of significant natural communities but, to your knowledge, does the state have records of just plain natural communities? Thanks for your help.

Subject: Empire Corridor GIS request

Hi Karen,

The best thing to do is e-mail me a shapefile of your project area. Also, please give me a call at 518-402-8926 so we can discuss your project. Then I can discuss with my supervisor what is the best way to provide data to you.

Thanks.

Hi John,

Pinyon Environmental, Inc. is working as part of the project team for the New York State Empire Corridor, Tier I EIS. We plan to submit a formal request for GIS information to your agency. However, I see on your website that certain items such as topo maps, counties and cities in the project boundary, etc. are to be included in the information request and that we should contact your agency for larger geographic area information requests. Our project area is a 463-mile long corridor. Could you provide me with information on how to proceed with our request? Thank you!

To: Addie Kim <AKim@HNTB.com>; Marissa Seifert <mseifert@HNTB.com>
Subject: RE: Info Request - New York State Empire Corridor Project

Hello, Marissa and Addie,

I have started digging into your request.

According to my records, it turns out we did process an original request in 2011, and I still have the shapefile for the route then. But then in 2012 Pinyon submitted a revised route; however, we were not contracted to conduct project screenings that year, and the 2012 request and shapefile went to NYSDEC, so I do not have a shapefile of the revised route. However, the map Addie provided in her recent email looks to be the original route. Please confirm which route you would like us to screen. If the revised route, could you please send a shapefile?

Yes, we did execute a data agreement with HNTB back in 2011. Since then, NYSDEC's legal department has directed us to use a new template for our data agreements (not surprisingly, it contains much more legalese than the old version). Once I'm clear on the route to screen, I would like to compare our current data with what was provided to you in 2011 and 2012. If there are only minor changes that I can convey to you in text, then we won't need a new data agreement. If the changes are substantial enough that you would need spatial data, then we would need to execute a new data agreement.

Will you want any other companies to have access to the data this time around?

Thanks,
Nick

Subject: RE: Info Request - New York State Empire Corridor Project

Hi,

Just wanted to follow up on this request for rare species and significant natural communities information for the High Speed Rail Empire Corridor (HSREC) Program. Attached for your review and information is the original (2011) data request with the general map attachment. The Federal Railroad Administration (FRA) and the New York State Department of Transportation (NYSDOT) published a Tier 1 Draft Environmental Impact Statement (EIS) in 2014. At that time, Pinyon Environmental was tasked with collecting and analyzing endangered species and ecology, and, on behalf of NYSDOT and HNTB, Pinyon initiated a data sharing agreement and collected NYSDEC GIS data on significant natural communities and endangered and threatened species. The original data request correspondence sent to NYSDEC is attached for your information. Please advise if you should need more detailed mapping of the corridor. The assessment for the Tier 1 EIS involved identification of resources within ½ mile of each of the prospective alternatives.

We are in the process of compiling the Tier 1 Final EIS on behalf of NYSDOT and FRA and would like to update the GIS NYSDEC rare species/significant natural communities data that was previously collected from your agency. Please

advise how we can obtain this GIS information directly from your agency, Marissa had forwarded the additional email correspondence and original data sharing agreement for the HSREC program with your agency.

Please feel free to call to discuss. Regards,

Addie

To: NaturalHeritage@dec.ny.gov
Subject: Info Request - New York State Empire Corridor Project

To whom this may concern,

I am writing to request GIS information for the New York Empire Corridor Project, which is a 463-mile-long railroad corridor. The data will be used for a response to comments on the New York State Empire Corridor, Tier I EIS from FRA. Essentially, we would require updated information on rare animals, rare plants, and significant natural communities which are documented in the NY Natural Heritage database as occurring in the NY State Empire Corridor. Due to the size of the project, it may be easier to send a shapefile of the project area.

Our subcontractor, Pinyon Environmental, Inc., had previously signed a data share agreement in 2011 to allow access to this information (see attached correspondence). Therefore, please inform us if this is acceptable for us to have access to the information or the steps necessary for us to obtain the data.

Please let me know next steps.

Best,

Hello Jeff,

Though I've heard about the High Speed Rail project a bit in the press, to my knowledge there has been little discussion of it here in Madison County. I've attached our recently finalized Coordinated Transportation Plan, which primarily deals with rural public transit. I don't know that we made any mention of rail (high speed or otherwise) in the document, so it may not be of much use to you. We lie between Syracuse and Utica and I suspect we wouldn't be served by any rail stops here, though citizens could certainly access the service via terminals in those respective cities. I'd welcome the opportunity to learn more about the project and how we may be of assistance to you.

Dear Jeff,

Preparation of the Wayne County Master Plan was suspended several years ago. However, Wayne County does have a Strategic Plan for Economic Development. Just go to www.wedcny.org and click on the downloads link on the left hand side to find the plan.

For over 20 years, Wayne County has been trying to establish an Amtrak Station in the Village of Lyons. Nearly \$500,000 has been spent in the preparation of plans with the hope that we could construct a station to serve the Finger Lakes Region. We are situated on the longest stretch of rail in the Empire Corridor without a station (90 miles between Rochester and Syracuse). Given the amount of work we have done to advance this project, we would like to be considered as a viable stop along the Empire Corridor.

RECORD OF TELEPHONE CALL

Job #	<u>61073501</u>	Date	<u>2/11/2011</u>
Call From	<u>Jane Thapa</u>	Of	<u>Pinyon Environmental, Inc</u>
Call To	<u>Karen Kays</u>	Of	<u>NYS Department of Health</u>
By	<u>Karen Kays</u>		(518)402-7751 – Jane Thapa's phone number

Subject Discussed

Jane returned a phone call from Karen (2/10/2011). Jane left a voicemail message stating that in order for us to obtain GIS information from the NYSDOH, (Karen originally requested well head protection data), that we should have David Chan send an email to Jane requesting the data. Jane will then send a Data Share form that should be signed by David and returned via email to Jane.

Action to be Taken

David Chan to email a data request to Jane Thapa at JCT02@health.state.ny.us.

>>> "Karen Kays" <Kays@pinyon-env.com> 2/10/2011 12:02 PM >>>

Good Afternoon Mr. Ozard:

I spoke with Katherine Barns and she thought you may be able to help me with the below request.

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1-attached).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

In order to complete the Tier 1 EIS, the project team will be reviewing available data. At this time, we respectfully request any Geographic Information System data regarding breeding birds along or within ½ mile of the 463 mile corridor (Figure 1-attached). While geographic information systems (GIS) data is preferred, any mappable data your office could provide would be greatly appreciated.

In addition, if it would be helpful, we can provide you with Shape files of the Project Centerline as well as the ½-mile buffer Project Area to overlay with your data.

If you have any questions, please feel free to contact me. Thank you.

From: Tara Salerno [<mailto:tmsalern@gw.dec.state.ny.us>]
Sent: Monday, March 07, 2011 11:27 AM
To: Karen Kays
Cc: DBargovic@chacompanies.com; Nick Conrad; AKim@hntb.com
Subject: RE: Empire Corridor GIS request

Hi Karen,
Please find attached a zip file containing three shapefiles. The shapefiles contain locations of rare species and significant natural communities which are documented within 0.5 mile of the New York Power State Empire Corridor Project. In the shapefiles, each location is represented as a shape (one or more polygons). Some locations may have more than one overlapping shape, indicating more than one rare species or community occurs at that location. See the attached documentation, **nynhp_docgis_11n.doc**, for more details on interpreting these shapes and for definitions of the data fields.

The shapefiles are in meters, UTM zone 18, NAD 83.

The shapefile **nynhp_EmpireCorridor_species_11** contains records of rare plants and rare animals last documented since 1980, and for which relatively precise locations are known.

The shapefile **nynhp_EmpireCorridor_potential_11** contains records of rare plants and rare animals either last documented before 1980 (historical records), and/or records for which precise or relatively precise locations are not known. For historical records, there is no recent information and their current status is unknown. If appropriate habitat for these plants or animals is present, it is possible they may still be present.

The shapefile **nynhp_EmpireCorridor_comms_11** contains records of significant natural communities. Natural community occurrences in this shapefile are all ranked as being of excellent or good quality, and/or are considered significant from a statewide perspective. By meeting specific, documented criteria, the NY Natural Heritage Program considers these occurrences to have high ecological and conservation value.

Please note: In addition to the rare species provided in the shapefiles the following species have been documented within the given distances from the project site. These species are known to move the indicated distances and so potentially may be found near the project site at some time.

1. Indiana bats (*Myotis sodalis*) have been documented within 2 miles of the project site and occur in the following counties & towns:
Onondaga – Manlius
2. Timber rattlesnakes (*Crotalus horridus*) have been documented within 1.5 miles of the project site in the following counties & towns:
Putnam – Philipstown

For descriptions of each of the ecological community types, please go to <http://www.dec.ny.gov/animals/29384.html> and click on DRAFT Ecological Communities of New York State. More detailed information about many of the natural community types in New York, including identification, dominant and characteristic vegetation, distribution, conservation, and management, is available online in Natural Heritage's Conservation Guides at www.acris.nynhp.org.

More detailed information about many of the rare and listed animals and plants in New York, including biology, identification, habitat, conservation, and management, are available online in Natural Heritage's Conservation Guides at www.acris.nynhp.org, from NatureServe Explorer at <http://www.natureserve.org/explorer>, from NYSDEC at

<http://www.dec.ny.gov/animals/7494.html> (for animals), and from USDA's Plants Database at <http://plants.usda.gov/index.html> (for plants).

Please confirm that you have received the data and let me know if you have any questions.

Thanks,

Tara

Subject: RE: Empire Corridor GIS request

Hi Karen,

As discussed on the phone, as part of receiving data in digital format from the NY Natural Heritage Program, we ask that you also agree to and sign a data sharing agreement. A draft agreement is attached. If there are any provisions that raise concerns or questions for you, please let me know. If the provisions are acceptable, let me know that by e-mail, too, and return a signed copy to me in the mail or by e-mail (scanned in signed copy). Upon hearing that the agreement is acceptable, we will prepare shapefiles of the locations of rare animals, rare plants, and significant natural communities which are documented in the NY Natural Heritage databases as occurring in the New York State Empire Corridor.

Let me know if you have any questions.

Thanks,
Tara

Hi Tara,

A few more questions.

1. Does your program handle the Hudson River Superfund Site? It appears from the NYSDEC website that it does but, I'm not 100% certain. I need to find hazardous waste information for the site..any ideas who to contact about that?
2. Also, I know you mentioned that you have record of significant natural communities but, to your knowledge, does the state have records of just plain natural communities? Thanks for your help.

Hi Karen,
The best thing to do is e-mail me a shapefile of your project area. Also, please give me a call at 518-402-8926 so we can discuss your project. Then I can discuss with my supervisor what is the best way to provide data to you.
Thanks.

Hi John,

Pinyon Environmental, Inc. is working as part of the project team for the New York State Empire Corridor, Tier I EIS. We plan to submit a formal request for GIS information to your agency. However, I see on your website that certain items such as topo maps, counties and cities in the project boundary, etc. are to be included in the information request and that we should contact your agency for larger geographic area information requests. Our project area is a 463-mile long corridor. Could you provide me with information on how to proceed with our request? Thank you!

Subject: RE: NYS DOT & FRA compliance (NEPA)
Attachments: National Parks and Recreation Areas.doc; Corridor Map_July 28 2010 (2).pdf

Fort Stanwix National Monument, Rome (FOST), Oneida County, NY, 15.52 acres, is an NPS unit within 1,000' of the Rome Amtrak Station.

Theodore Roosevelt Inaugural NHS (THRI), Buffalo, Erie County, 1.03 acres, may be within 1,000' of the Niagara Falls spur (depending on which of the three active rail routes you use through Buffalo).

Montezuma NWR is more than 1,000' from the NY Central/Conrail/CSX ROW

Women's Rights NHS, Seneca Falls & Waterloo, Seneca County, NY is more than 1,000' away as is Martin Van Buren NHS, Kinderhook, Columbia County.

As you already know, your line runs through Roosevelt-Vanderbilt NHS at two locations in Hyde Park, Dutchess County.

You'll have to check the distances from your alignment to General Grant NM (Grant's Tomb), Hamilton Grange NM, and Theodore Roosevelt Birthplace NM, and Saint Pauls NHS in Mount Vernon which are all NPS units administered by Manhattan Sites. Other units of Manhattan Sites (Castle Clinton and Federal Hall are at the southern tip of the island, well outside the 1,000' zone.

You should also check with the Bureau of Indian Affairs (BIA). the Tuscarora Reservation, Niagara County; Tonawanda Seneca Reservation, Erie and Orleans Counties; Onondaga reservation, Onondaga County; and Oneida Reservation, Madison County are all outside the 1,000' zone but within 1-5 miles of the ROW. BIA recently designated trust land for the Seneca Nation of Indians (Cattaraugus) in the cities of Buffalo, Erie County and Niagara Falls, Niagara County and the Cayuga, Oneida, and Mohawk Nations have active land claims suits that include portions of your corridor. BIA's Eastern Regional Office is in Chattanooga, TN. I don't know anyone there anymore. My principal contact died last weekend, so you'll have to make a cold call.

We have GIS data for the Erie Canalway NHC boundary and are refining datalayers for the NYS Canal System as part of a National Register District nomination that we expect to complete by September. We got most everything else from the NYS GIS Clearinghouse.

NY-SHPO has been refining point and area data for NHL and National Register sites and districts. Their data is much more accurate than that from the NPS NHL and NR databases.

RE: NYS DOT & FRA compliance (NEPA)

Hi Nigel,

Using existing web-based mapping, our study area for parklands and recreation areas is 1,000 feet on either side of the centerline of existing and proposed tracks (although GIS mapping will extend beyond this area for presentation graphics purposes, which is why we are seeking GIS for areas beyond this). The National parks, National Natural Landmarks, Natural Heritage Areas, and Natural Historic Sites that we have identified within 1,000 feet of the project centerline are described below and in the attached write-up (note this list does not include National Historic Landmarks being addressed as part of Cultural Resource Investigations):

- o Hudson River Valley National Heritage Area
- o Erie Canalway National Heritage Area
- o Niagara Falls National Heritage Area, including the community of Niagara Falls at the western end of the Niagara Branch railroad.

Name-County Acreage within 2,000-foot-wide
study area

Vanderbilt Mansion National Historic Site-Dutchess

Federal Land within Hudson Highlands State Park -Putnam

0.4

Moss Island National Natural Landmark-Herkimer

15

Montezuma National Wildlife Refuge-Wayne

557

If we have missed something within the 2,000-foot wide study area centered on the railroad, please advise. We are interested in GIS mapping for the broader area for mapping/graphics presentation purposes.

Best regards,

Addie

Hi Addie,

This could concern quite a few National Parks and affiliated areas and I cannot say which are really within 1/2 mile of the corridor. Is it safe to assume that this is also equal to 1/2 mile from the railroad tracks? I think it will be best on our end to have someone in the NPS Planning & Compliance Division determine whether the given park is w/in the area of interest as defined in your official request so I will forward this along to Terry Moore, Chief of P&C, for his consideration. Please let me know if you do not hear from someone else regarding this within your timeframe and I will follow up if necessary.

best wishes,

Nigel

RE: Fw: requested info re Hart's  
Woods NNL

Greatly appreciate your assistance in this matter. Yes, the Empire Corridor extends 463 miles from New York City north to Albany, then west to Buffalo and Niagara Falls. Please refer to formal information request below and attached map:

---

Dear Sir/Madam:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

In order to complete the Tier 1 EIS, the project team will be reviewing available data. At this time, we respectfully request any Geographic Information System data regarding national heritage areas, parks, and national historic sites (and National Historic Landmarks) along or within ½ mile of the 463 mile corridor (Figure 1). Any information on sites that have received Land and Water Conservation Funding would be of interest.

While geographic information systems (GIS) data is preferred, any mappable data your office could provide would be greatly appreciated.

If you have any questions, please feel free to contact me.

Best regards,

Addie

Hi Deb,

The Empire Corridor sounds like it is in NY state (and Wikipedia confirms). Duncan Hay manages the mapping for the Erie Canal National Heritage Corridor, which appears to be roughly coincident with much of the e-w stretch of the Empire Corridor. Duncan can be reached via email: Duncan\_Hay@nps.gov or by phone at (617) 223-5056.

Thanks Deb!

The other site of particular interest is Moss Island. Other that may be in our vicinity (but difficult to confirm) are Bergen-Byron Swamp, Zurich Bog, Round Lake, and Montezuma Marshes.

If you could please provide a National Park Service GIS contact that we could obtain other NPS mapping from, it would be much appreciated.

Thanks very much!

Empire Corridor

a. National Parks and Recreation Areas

There are several types of federally designated parks or recreation areas, including National Heritage Areas, National Natural Landmarks, National Wildlife Refuges, and National Historic Sites. National Historic Landmarks and National Register Historic Districts in the project area are addressed under **Section ***.

- **National Heritage Areas:** Congress established National Heritage Areas to promote historic preservation and an appreciation of the history and heritage of the designated site. National Heritage Areas are not federally owned or managed, but are administered by state or local governments or non-profit or private corporations, with the National Park Service providing an advisory role. The Empire Corridor traverses through three National Heritage Areas:
 - **Hudson River Valley National Heritage Area:** The Hudson River Valley National Heritage Area was designated by Congress in 1996 and extends from New York City north to Albany, along the Empire Corridor South. The heritage of the region dates back to the Revolutionary War, with several National Historic Landmarks and historic districts, estates of well-known historical figures, scenic parks, and gardens.
 - **Erie Canalway National Heritage Area:** The Erie Canalway National Heritage Area includes the Erie Canal system (Erie, Champlain, Oswego, and Cayuga-Seneca Canals) that extends through upstate New York, along most of the central and eastern portions of the Empire Corridor West. The New York State Canal System is the most commercially enduring and historically significant canal way in the United States. This waterway played a key role in turning New York City into our country's most important center for commerce, industry, and finance.
 - **Niagara Falls National Heritage Area:** Designated by Congress in 2008, the Niagara Falls National Heritage Area stretches from the western boundary of Wheatfield, New York to the mouth of the Niagara River on Lake Ontario, including the community of Niagara Falls at the western end of the Niagara Branch. The region is home to natural wonders, rich cultural traditions, and nationally significant historical sites.
- **National Natural Landmark:** The National Registry of Natural Landmarks includes nationally significant geological and biological features. Only one-half of the National Natural Landmarks are administered solely by public agencies, and nearly one-third are owned entirely by private parties. Because many natural landmarks are privately owned and/or not managed for public access, owner permission must be obtained prior to visitation. Designation in no way infers any right of public access.

The only site within 1,000 feet of the project corridor is **Moss Island**, near Milepost 216 and Lock 17 on the Erie Canal in Little Falls, Herkimer County. Moss Island is part of an uplifted fault block of ancient crystalline rock. It contains the best exposure of glacial age potholes eroded by meltwater floods in the eastern United States. It was designated in 1976 and is owned by the state.

- **National Wildlife Refuge:** The National Wildlife Refuge System, managed by the U.S. Fish and Wildlife Service, is the nation's system of public lands and waters set aside to conserve fish, wildlife and plants. Recreational wildlife-dependent uses permitted on some refuges include hunting and fishing, wildlife observation, photography, environmental education, and interpretation.

The only national wildlife refuge within 1,000 feet of the project corridor is the **Montezuma National Wildlife Refuge** (at Mileposts 323 to 326) in Wayne County. The area known as the Montezuma Marshes once drew thousands of waterfowl making their annual fall migration. In 1938, the Montezuma NWR was formed to restore the wetland habitat with impoundments created by development of the Erie Canal, smaller feeder canals, and agricultural development. Today, the refuge consists of 10,000 acres, and accommodates recreational uses, including hunting that is restricted (on designated days only upon reservation to a limited number of individuals and groups).

- **National Historic Sites:** Two National Historic Sites along the banks of the Hudson River in Hyde Park, Dutchess County are within the 1,000 foot buffer area. These sites are open to the public and are nationally important recreational tourism destinations:
 - **Vanderbilt Mansion National Historic Site:** The 50-room Classical-style mansion on 211 acres (near Milepost 80) was built in 1898. It was constructed by Frederick William Vanderbilt, a grandson of “Commodore” Cornelius Vanderbilt - the shipping and railroad magnate and richest man in America during his lifetime. Landscaped grounds feature a formal terraced garden, expansive lawns, carriage roads, and a three-mile-long riverside hiking trail.
 - **Home of Franklin D. Roosevelt National Historic Site:** This site covering more than 740 acres (at Mileposts 77-78) was the birthplace, lifelong home, and burial place of Franklin Delano Roosevelt, America’s 32nd President. It was purchased by Roosevelt’s father in 1867, and, by 1915, Franklin and his mother, Sara, had undertaken extensive renovations that included the addition of two large wings. The grounds that feature flower gardens, outbuildings, and miles of walking trails. The Rose Garden contains the graves of Franklin and Eleanor Roosevelt.

Table 1 summarizes the publicly owned acreage within National Historic Sites, National Wildlife Refuge, and federal preserves within 1,000 feet of the project centerline.

Table 1—National Natural Landmark, Historic Sites, Wildlife Refuge, and Preserve within Study Area

Name	County	Acreage within 2,000-foot-wide study area	Potential Section 4(f)
Vanderbilt Mansion National Historic Site	Dutchess	143	x
Franklin D Roosevelt Home National Historic Site	Dutchess	82	x
Federal Land within Hudson Highlands State Park	Putnam	0.4	x
Moss Island National Natural Landmark	Herkimer	15	x
Montezuma National Wildlife Refuge	Wayne	557	x

RE: High Speed Rail Empire Corridor Project (PIN S937.51.171)

Dear Mr. Grilli,

This is in response to your letter dated March 18, 2011 regarding the proposed New York State High Speed Rail Empire Corridor Project. The project is proposed by the New York State Department of Transportation (NYSDOT) in cooperation with the Federal Railroad Administration (FRA). The rail corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls. Your letter requests information on the presence of federally listed threatened or endangered species in the vicinity of the proposed project, specifically within major streams and rivers located within 300 feet of the track centerline as listed in Appendix A of your letter.

A population of endangered shortnose sturgeon (*Acipenser brevirostrum*) occurs in the Hudson River below the Troy Dam. No shortnose sturgeon are known to occur in any of the waterbodies listed in Attachment A of your letter. Similarly, the New York Bight Distinct Population Segment (DPS) of Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*), which was proposed for listing as threatened by NMFS in October 2010, occurs in the Hudson River. However, Atlantic sturgeon are not known to occur in any of the waterbodies listed in Attachment A of your letter. As no listed or proposed species or critical habitat occur in the action area, no further coordination with NMFS on the effects of the proposed action is necessary. Should you have any questions regarding these comments, please contact Julie Crocker at (978)282-8480.

Sincerely,

Mary A. Colligan
Assistant Regional Administrator
for Protected Resources

Karen,

I'm sorry for not getting back to you sooner. I have many explanations, but no excuses.

Here is a shape file that has all the WSRR sections (NYS designations and federal designations). NY state regulates a corridor surrounding the rivers that can be as much as a 1/2 on either side of the river. However, as you will see, there is nothing even close to the high speed rail corridor you sent me. Call me if you have any questions.

Thanks for your patience and for the friendly reminder.

Hi JR,

Thank you for the response and information. I am including some further information about the project below. I spoke with Katherine Barns this morning and she mentioned that you may be able to provide me with information on State Wild and Scenic Rivers along or within a ½ mile of the 463 mile corridor (Figure 1 - attached). If necessary, we can provide you with Shape files of the Project Centerline as well as the ½-mile buffer Study Area to overlay with your data.

Please note, we will be also be sending you a formal letter request.

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1-attached).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

In order to complete the Tier 1 EIS, the project team will be reviewing available data. At this time, we respectfully request any Geographic Information System data regarding state wild and scenic rivers along or within ½ mile of the 463 mile corridor (Figure 1 - attached). While geographic information systems (GIS) data is preferred, any mappable data your office could provide would be greatly appreciated.

If you have any questions, please feel free to contact me. Thank you.

Subject: Fwd: Hudson River Superfund Site Question

Karen,

I got your phone message yesterday and I'm glad that you talked with Tara about information on rare things. If you want GIS information on state regulated freshwater wetlands you can find that at:

<http://cugir.mannlib.cornell.edu/>

Please contact Judy Stevens, our freshwater wetlands mapping coordinator, if you have questions on the freshwater wetlands maps (I've copied her on this e-mail). Also, you can find other information at DEC's Environmental Resource Mapper

<http://www.dec.ny.gov/imsmaps/ERM/viewer.htm>

Good luck.

Hi Steve,

Tara Salerno from the Natural Heritage Program gave me your contact information and thought you might be able to help me. Pinyon is part of the project team assisting NYSDOT and FRA with the High Speed Rail Empire Corridor Tier I EIS project. Currently, we are assembling data for the 463-mile corridor. Are you the right person to contact regarding hazardous materials/substance data related to the Hudson River Superfund Site. At this point we are looking for GIS data so that we can conduct a review of existing conditions within the project buffer area. If you are not the correct person to contact regarding the process to request data, could you point me in the right direction? Thanks in advance for your help.

Date: Apr 19, 2011

Regarding: High Speed Rail Empire Corridor Project, PIN S937.51.171

Town/County: from Pennsylvania Station in New York City to Niagara Falls, New York

We have received your request for information regarding occurrences of Federally-listed threatened and endangered species within the vicinity of the above-referenced project/property. Due to increasing workload and reduction of staff, we are no longer able to reply to endangered species list requests in a timely manner. In an effort to streamline project reviews, we are shifting the majority of species list requests to our website at <http://www.fws.gov/northeast/nyfo/es/section7.htm>. Please go to our website and print the appropriate portions of our county list of endangered, threatened, proposed, and candidate species, and the official list request response. Step-by-step instructions are found on our website.

As a reminder, Section 9 of the Endangered Species Act (ESA) (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) prohibits unauthorized taking* of listed species and applies to Federal and non-Federal activities. Additionally, endangered species and their habitats are protected by Section 7(a)(2) of the ESA, which requires Federal agencies, in consultation with the U.S. Fish and Wildlife Service (Service), to ensure that any action it authorizes, funds, or carries out is not likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat. An assessment of the potential direct, indirect, and cumulative impacts is required for all Federal actions that may affect listed species. For projects not authorized, funded, or carried out by a Federal agency, consultation with the Service pursuant to Section 7(a)(2) of the ESA is not required. However, no person is authorized to "take"* any listed species without appropriate authorizations from the Service. Therefore, we provide technical assistance to individuals and agencies to assist with project planning to avoid the potential for "take," or when appropriate, to provide assistance with their application for an incidental take permit pursuant to Section 10(a)(1)(B) of the ESA.

Project construction or implementation should not commence until all requirements of the ESA have been fulfilled. If you have any questions or require further assistance regarding threatened or endangered species, please contact the Endangered Species Program at (607) 753-9334. Please refer to the above document control number in any future correspondence.

Endangered Species Biologist: Sandra Doran

*Under the Act and regulations, it is illegal for any person subject to the jurisdiction of the United States to take (includes harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect; or to attempt any of these), import or export, ship in interstate or foreign commerce in the course of commercial activity, or sell or offer for sale in interstate or foreign commerce any endangered fish or wildlife species and most threatened fish and wildlife species. It is also illegal to possess, sell, deliver, carry, transport, or ship any such wildlife that has been taken illegally. "Harm" includes any act which actually kills or injures fish or wildlife, and case law has clarified that such acts may include significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife.

Hi Karen,

My apologies for missing your phone call. I created GIS maps using the CEA data we have internally which is also public. Each CEA is also located on our website as well at:

<http://www.dec.ny.gov/permits/6184.html>

The first map (All in PDF Format) is a neat map of the whole state with a legend, than I reduced the scale and made several maps for each area so that you can visually see the details. I hope this will work for your needs. Best regards and thanks for providing the shape file,

David.

>>> "Karen Kays" <Kays@pinyon-env.com> 4/28/2011 3:55 PM >>>

Hi David,

Below is the original request for information that I has sent to Bob. As you will see the attached documents are a general map of the corridor and shape files of the project centerline and half mile buffer. I left you a voice message but, I thought this might be a helpful first step in understanding our data needs. Please feel free to contact me at any time to discuss. Thank you.

Subject: Empire Corridor High Speed Rail

Good Morning Mr. Ewing:

Thank you for returning my phone call yesterday. Below is a description of the project and a request for data. Please note, this email will be followed by a formal mailed request. I've also attached shape files of the project centerline and ½ mile buffer.

PROJECT INFORMATION AND DATA REQUEST:

The New York State Department of Transportation (NYSDOT), in cooperation with the Federal Railroad Administration (FRA), is beginning the environmental review process for the proposed New York State High Speed Rail Empire Corridor Project between Pennsylvania Station in New York City and Niagara Falls, New York. The corridor proceeds north from New York City through Albany and then turns west to Schenectady, passing through Syracuse, Rochester and Buffalo before terminating at Niagara Falls, a distance of 463 miles (Figure 1).

A Tier 1 Environmental Impact Statement (EIS), in accordance with the National Environmental Policy Act (NEPA) of 1969 and the New York State Environmental Quality Review Act (SEQRA), is being completed to evaluate and document potential improvements and projects to intercity passenger rail service within the corridor. The projects identified in the Tier 1 EIS will be subject to detailed environmental review in Tier 2 project-level NEPA documents.

In order to complete the Tier 1 EIS, the project team will be reviewing available data. At this time, we respectfully request any Geographic Information System data regarding SEQR Critical Environmental Areas along or within a ½ mile of the 463 mile corridor (Figure 1). While geographic information systems (GIS) data is preferred, any mappable data your office could provide would be greatly appreciated.

If you have any questions, please feel free to contact me. Thank you.

RE: High Speed Rail Project (PIN S937.51.171)

Dear Mr. Grilli:

This responds to your letter of March 18, 2011 concerning the environmental review process for the subject project. I apologize for the delay of my response as it took some time to search our files for the copies of all existing bridge permits you requested.

The U. S. Coast Guard (USCG), as a regulatory agency, is responsible for issuance of bridge permits pursuant to The General Bridge Act of 1946 (33 U.S.C 525-533) and promulgation of drawbridge regulations (33 U.S.C. 499). For the referenced project, the USCG has federal jurisdiction over all structures crossing navigable waters of the United States. Not all of the bridges in the project area will require a USCG Bridge Permit; however, the USCG will need to review each bridge action on a case-by-case basis. Some of the waterways crossed by the project may fall under various other categories of jurisdiction. In all cases however, we must address the reasonable needs of navigation and coordinate with appropriate waterway users, facilities and bridge owners in addition to Federal Railroad Administration (FRA) and their consultants, as applicable. The Coast Guard's Bridge Permit Application Guide can be found at http://www.uscg.mil/hq/cg5/cg551/BPAG_2008.pdf

Following a review of our files for the project area, we have identified five bridges for which permits were issued. They are as follows:

1. Spuyten Duyvil RR Bridge over the Harlem River
2. Metro-North RR Bridge over the Croton River
3. Metro-North RR Bridge over Peekskill Creek
4. Livingston Avenue RR Bridge
5. New Hamburg RR Bridge over Wappinger Creek

Our office has the first four listed bridge permits on file, which are provided as enclosures (1) through (4), respectively. Unfortunately, we do not have a copy of the permit issued by the Secretary of War in 1929 for the bridge crossing Wappinger Creek.

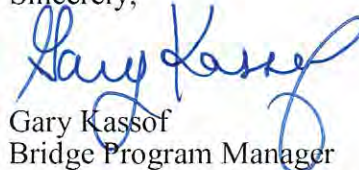

16591
July 7, 2011

The USCG will coordinate with all other resource and permitting agencies (federal, state & local) in conjunction with our bridge permitting process. We will also coordinate with USCG Sector New York Waterways Management Division on all bridge construction and modification issues. Please note that dredging and placement of fill with exception of that pertaining to a bridge structure itself, is not within the purview of the USCG, but rather with the U.S. Army Corps of Engineers.

As you are aware other federal agencies have oversight responsibilities for other environmental areas to ensure that impacts on the human environment are addressed and mitigated as necessary. It is recommended that the environmental process for this project include (if not already included) coordination with federal, state and local agencies with jurisdiction or expertise over all aspects of the project.

If you have questions in the interim, please contact Chris Bisignano, project manager, at (212) 668-7994.

Sincerely,

Gary Kassof
Bridge Program Manager
First Coast Guard District
By direction of the District Commander

David Chan, Project Manager, NYSDOT

WHEREAS, Under date of August 28, 1894, the Acting Secretary of War approved plans for rebuilding the bridge of the New York Central and Hudson River Railroad across Spuyten Duyvil Creek, at its mouth, in the State of New York;

AND WHEREAS, Under date of November 22, 1897, the Secretary of War approved the plans of a temporary pile trestle bridge at said place to be used while said permanent bridge was being constructed, subject to the following condition, inter alia:

"4. That the new permanent bridge, the plans of which were approved by the Acting Secretary of War as aforesaid, shall be completed and put in service by January 1, 1900; and that within ninety days after the completion of said new permanent bridge, said company shall completely remove said temporary bridge as well as all portions of the present structure not embodied in the said new permanent bridge, all at its own expense";

AND WHEREAS, The New York Central & Hudson River Rail Road Company has now applied to the Secretary of War for an extension of time for the complete removal of said temporary pile trestle bridge;

NOW THEREFORE, This is to certify that, in accordance with the recommendation of the Chief of Engineers, the Secretary of War hereby extends the time for the complete removal of said temporary pile trestle bridge to a period not later than May 1, 1903.

WITNESS my hand this 24th day of May, 1901.

Elihu Root,

Secretary of War.

Copy of 23428/26.

BRIDGE PERMIT

MAR 17 1995

(6-95-1)

WHEREAS by Title V of an act of Congress approved August 2, 1946, entitled "General Bridge Act of 1946," as amended (33 U.S.C. 525-533), the consent of Congress was granted for the construction, maintenance and operation of bridges and approaches thereto over the navigable waters of the United States;

AND WHEREAS the Secretary of Transportation has delegated the authority of Section 502(b) of that act to the Commandant, U.S. Coast Guard by Section 1.46(c) of Title 49 Code of Federal Regulations;

AND WHEREAS before construction is commenced, the Commandant must approve the location and plans of any such bridge and may impose any specific conditions relating to the construction, maintenance and operation of the structure deemed necessary in the interest of public navigation, such conditions to have the force of law;

AND WHEREAS the Commandant of the Coast Guard has further delegated to the District Commanders by Section 1.01-60(b) of Title 33 Code of Federal Regulations authority to issue permits for the construction, reconstruction, or alteration of bridges across navigable waters of the United States;

AND WHEREAS the - METRO-NORTH COMMUTER RAILROAD COMPANY - has submitted for approval plans for modification of a bridge constructed across the Croton River between Ossining and Croton-on-Hudson, New York;

NOW THEREFORE, This is to certify that the location and plans revised June 1994 are hereby approved by the Commander, First Coast Guard District, subject to the following conditions:

1. No deviation from the approved plans may be made either before or after completion of the structure unless the modification of said plans has previously been submitted to and received the approval of the District Commander.

2. The construction of falsework, cofferdams or other obstructions, if required, shall be in accordance with plans submitted to and approved by the District Commander prior to modification of the bridge. All work shall be so conducted that the free navigation of the waterway is not unreasonably interfered with and the present navigable depths are not impaired. Timely notice of any and all events that may affect navigation shall be given to the District Commander during modification of the bridge. Methods shall be employed to ensure that there will be no increases of sedimentation and turbidity in the waterway during construction. The channel or channels

MAR 17 1995

Continuation Sheet

BRIDGE PERMIT

Metro-North Railroad Bridge across the Croton River
between Ossining and Croton-on-Hudson, New York

(6-95-1)

through the structure shall be promptly cleared of all obstructions placed therein or caused by the modification of the bridge to the satisfaction of the District Commander, when in the judgment of the District Commander the modification work has reached a point where such action should be taken, but in no case later than 90 days after the bridge has been opened to traffic.

3. Issuance of this permit does not relieve the permittee of the obligation or responsibility for compliance with the provisions of any other law or regulation as may be under the jurisdiction of the U. S. Department of Commerce, National Marine Fisheries Service; State of New York: Department of State; Department of Environmental Conservation, or any other federal, state or local authority having cognizance of any aspect of the location, modification or maintenance of said bridge.

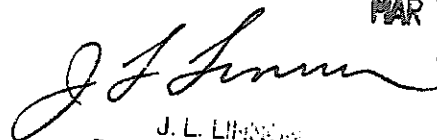

4. All parts of the existing to be modified Metro-North Railroad Bridge across the Croton River, mile 0.0, not utilized in the new modified bridge shall be removed in their entirety and the waterway cleared to the satisfaction of the District Commander. A period of 90 days subsequent to the completion of the modified Metro-North Railroad Bridge will be allowed for such removal and clearance.

5. A bridge fendering system shall be installed and maintained in good condition by and at the expense of the owner of the bridge when so required by the District Commander. Said installation shall be for the safety of navigation and be in accordance with plans submitted to and approved by the District Commander prior to its construction.

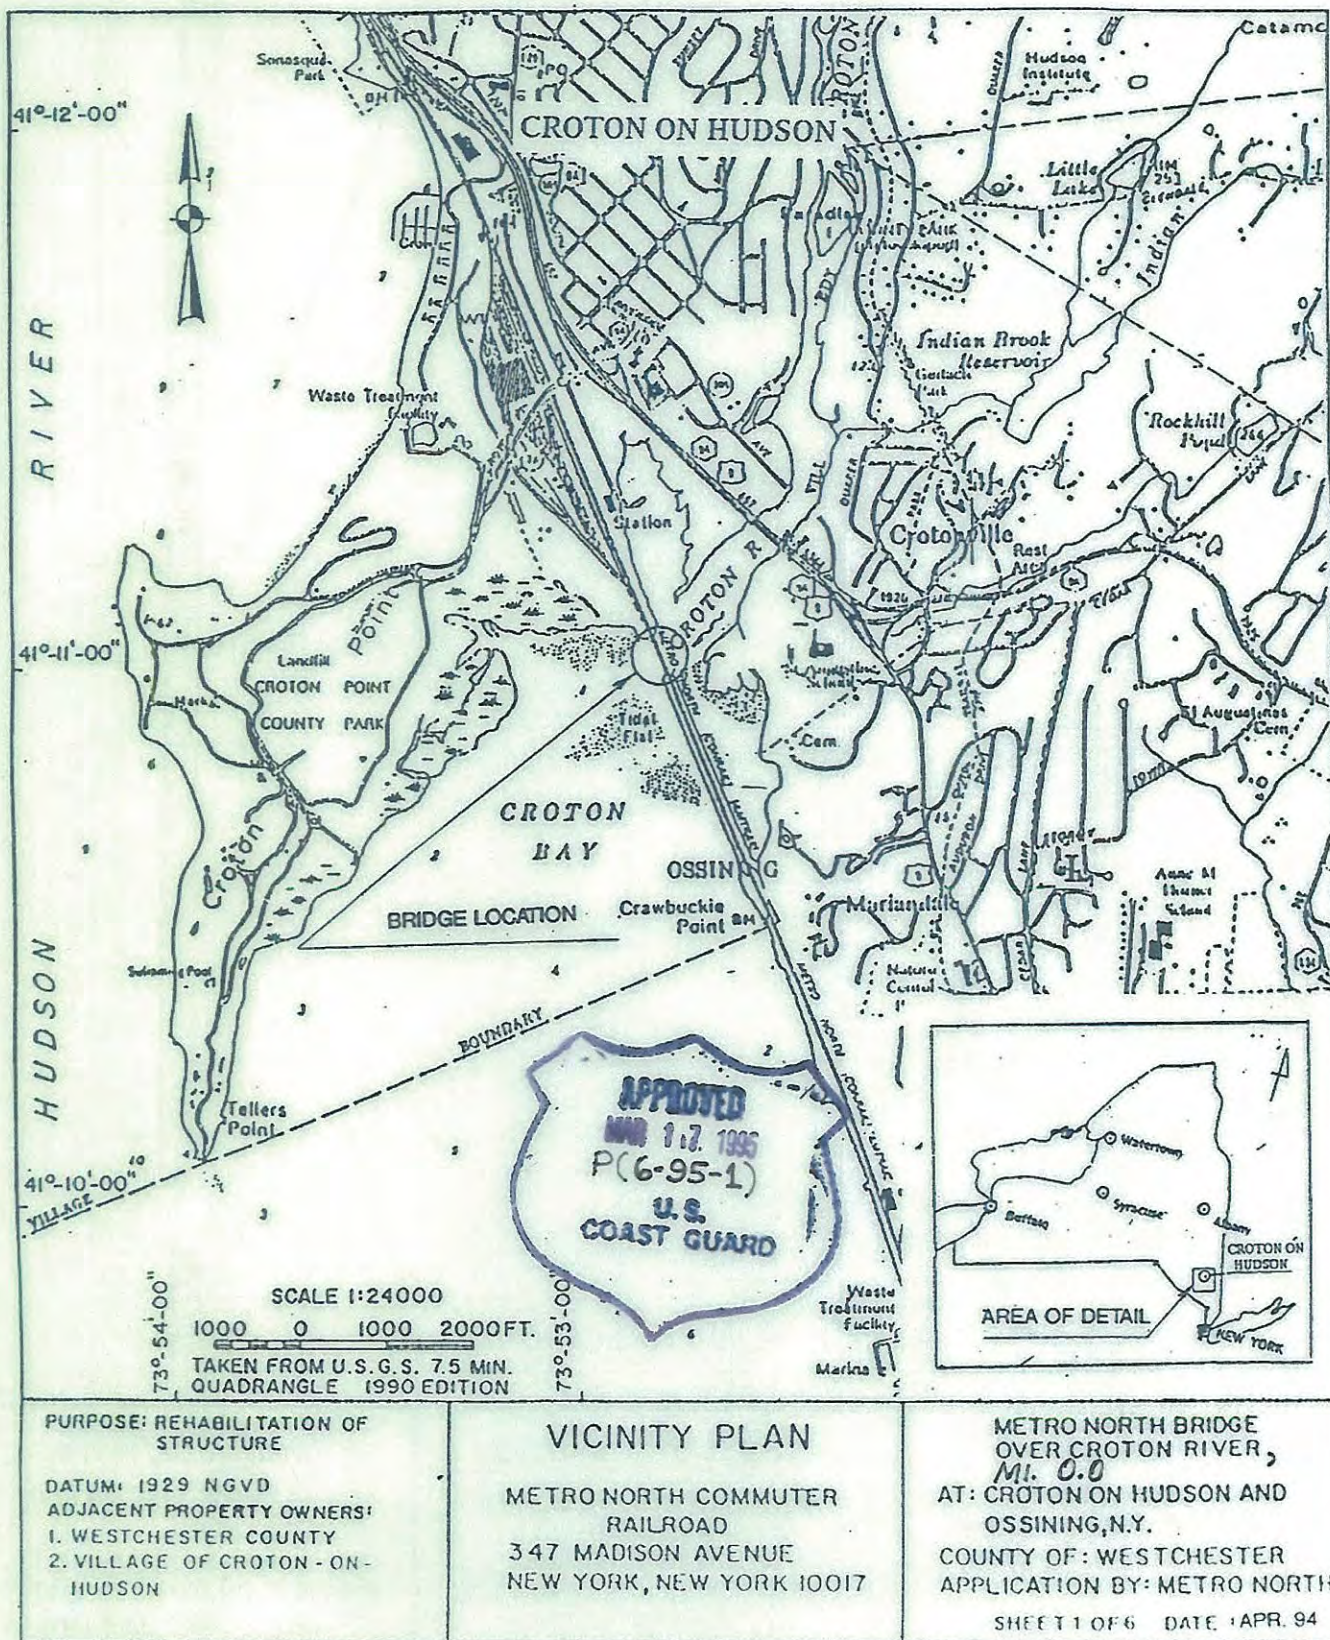

6. When the existing to be modified bridge is no longer used for transportation purposes, it shall be removed in its entirety or to an elevation deemed appropriate by the District Commander and the waterway cleared to the satisfaction of the District Commander. Such removal and clearance shall be completed by and at the expense of the owner of the bridge upon due notice from the District Commander.

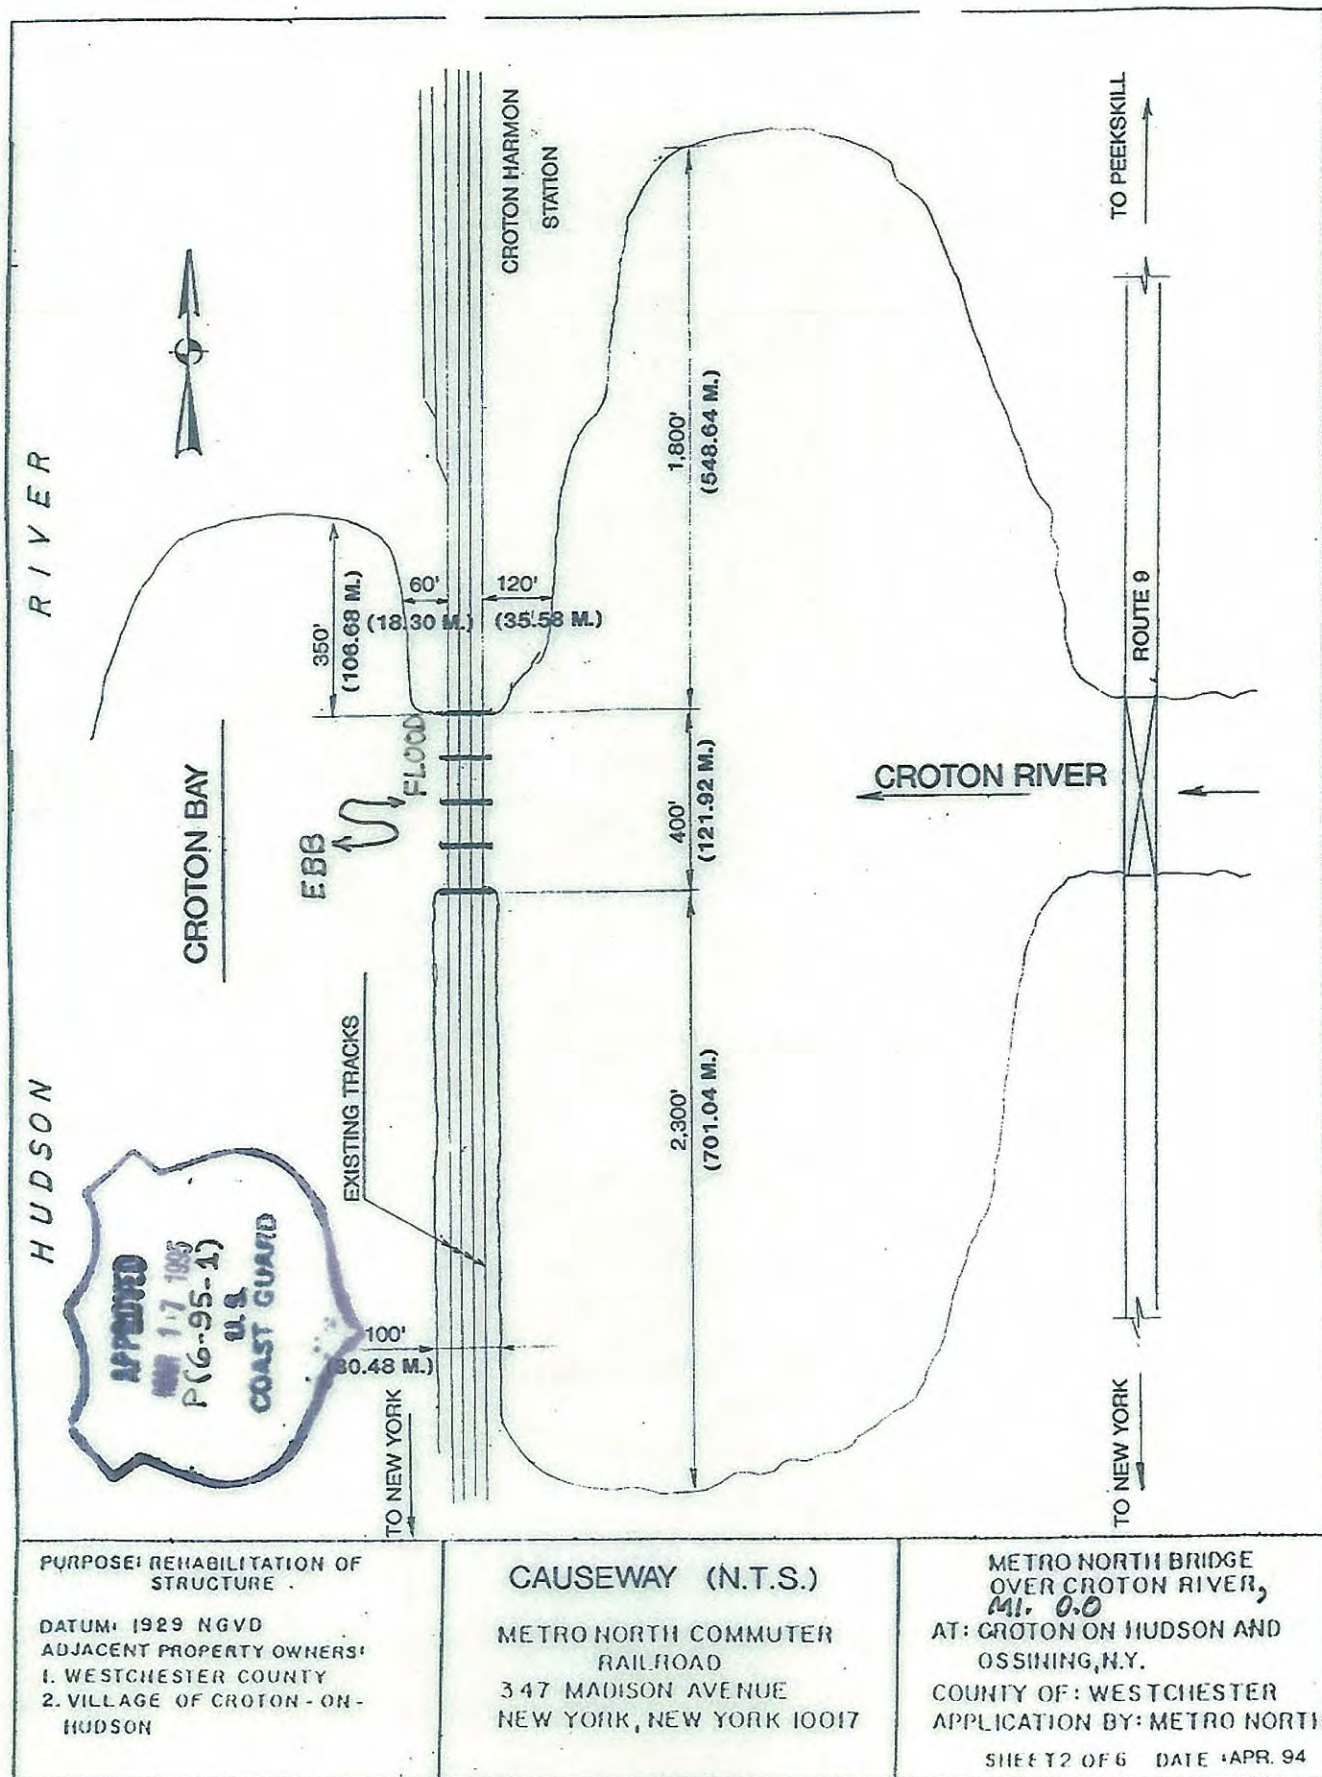

7. The approval hereby granted shall cease and be null and void unless modification of the bridge is commenced within three years and completed within five years after the date of this permit.

BRIDGE PERMIT

APR 01 1998

AMENDMENT
(12-94a-1)

WHEREAS by a permit issued on 4 October 1994, the Commander, First Coast Guard District approved the location and plans of a railroad bridge to be constructed by Metro-North Commuter Railroad Company across Peekskill Creek at Peekskill, New York, under authority of the General Bridge Act of 1946, as amended;

AND WHEREAS condition 1 of that permit provides that no deviation from the approved plans may be made either before or after completion of the structure unless the modification of said plans has previously been submitted to and received the approval of the Commander, First Coast Guard District, and condition 6 required that the temporary, detour bridge be removed no later than 90 days subsequent to the opening to traffic of the new permanent bridge and the - METRO-NORTH COMMUTER RAILROAD COMPANY- now has submitted for approval revised plans indicating modification to the previously approved plans and requests that the time for removal of the temporary bridge be extended;

NOW THEREFORE, This is to certify that plan sheet 5 (of 6) last revised 21 April 1997 hereby approved supersedes plan sheet 5 (of 6) revised February 1994 and supplements plan sheet 1 (of 6) dated October 1993, sheets 2 and 6 revised January 1994 and sheets 3 and 4 revised February 1994 previously approved. In granting this approval, all conditions to which the original permit was subject remain in force with condition 6 modified as follows:

6. The temporary, detour bridge, or incomplete parts thereof, shall be removed in their entirety except for piles which shall be removed to a minimum of five feet below the natural bottom and the waterway cleared to the satisfaction of the District Commander. A period of 180 days subsequent to the opening to traffic of the new permanent bridge will be allowed for such removal and clearance.

BRIDGE PERMIT

OCT 4 1994

(12-94-1)

WHEREAS by Title V of an act of Congress approved August 2, 1946, entitled "General Bridge Act of 1946," as amended (33 U.S.C. 525-533), the consent of Congress was granted for the construction, maintenance and operation of bridges and approaches thereto over the navigable waters of the United States;

AND WHEREAS the Secretary of Transportation has delegated the authority of Section 502(b) of that act to the Commandant, U.S. Coast Guard by Section 1.46(c) of Title 49 Code of Federal Regulations;

AND WHEREAS before construction is commenced, the Commandant must approve the location and plans of any such bridge and may impose any specific conditions relating to the construction, maintenance and operation of the structure deemed necessary in the interest of public navigation, such conditions to have the force of law;

AND WHEREAS the Commandant of the Coast Guard has further delegated to the District Commanders by Section 1.01-60(b) of Title 33 Code of Federal Regulations authority to issue permits for the construction, reconstruction, or alteration of bridges across navigable waters of the United States;

AND WHEREAS - METRO-NORTH COMMUTER RAILROAD COMPANY - has submitted for approval the location and plans of a bridge to be constructed across Peekskill Creek at Peekskill, New York;

NOW THEREFORE, This is to certify that the location and plan sheet 1 (of 6) dated October 1993, sheets 2 and 6 revised January 1994, and sheets 3, 4, and 5 revised February 1994 are hereby approved by the Commander, First Coast Guard District, subject to the following conditions:

1. No deviation from the approved plans may be made either before or after completion of the structure unless the modification of said plans has previously been submitted to and received the approval of the District Commander.

Bridge across Peekskill Creek at
Peekskill, New York

(12-94-1)

2. The construction of falsework, cofferdams or other obstructions, if required, shall be in accordance with plans submitted to and approved by the District Commander prior to construction of the bridge. All work shall be so conducted that the free navigation of the waterway is not unreasonably interfered with and the present navigable depths are not impaired. Timely notice of any and all events that may affect navigation shall be given to the District Commander during construction of the bridge project. The channel or channels through the structure shall be promptly cleared of all obstructions placed therein or caused by the construction of the bridge to the satisfaction of the District Commander, when in the judgment of the District Commander the construction work has reached a point where such action should be taken, but in no case later than 90 days after the new permanent bridge has been opened to traffic.

3. Issuance of this permit does not relieve the permittee of the obligation or responsibility for compliance with the provisions of any other law or regulation as may be under the jurisdiction of the State of New York, Department of Environmental Conservation, or any other federal, state or local authority having cognizance of any aspect of the location, construction or maintenance of said bridge.

4. All parts of the existing to be replaced Metro-North Railroad Bridge across Peekskill Creek, mile 0.0, not utilized in the new permanent bridge, shall be removed to a minimum of five feet below the natural bottom, and the fender system shall be removed to a minimum of two feet below the bottom. The waterway shall be cleared to the satisfaction of the District Commander. A period of 90 days subsequent to the opening to traffic of the new permanent bridge, mile 0.0, will be allowed for such removal and clearance.

5. The temporary, detour bridge shall be constructed in accordance with plan sheet 5 of 6 revised February 1994.

6. The temporary, detour bridge, or incomplete parts thereof, shall be removed in their entirety and the waterway cleared to the satisfaction of the District Commander. A period of 90 days subsequent to the opening to traffic of the new permanent bridge will be allowed for such removal and clearance.

OCT 4 1994

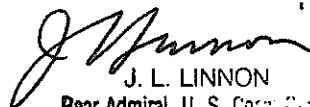

Bridge across Peekskill Creek at
Peekskill, New York

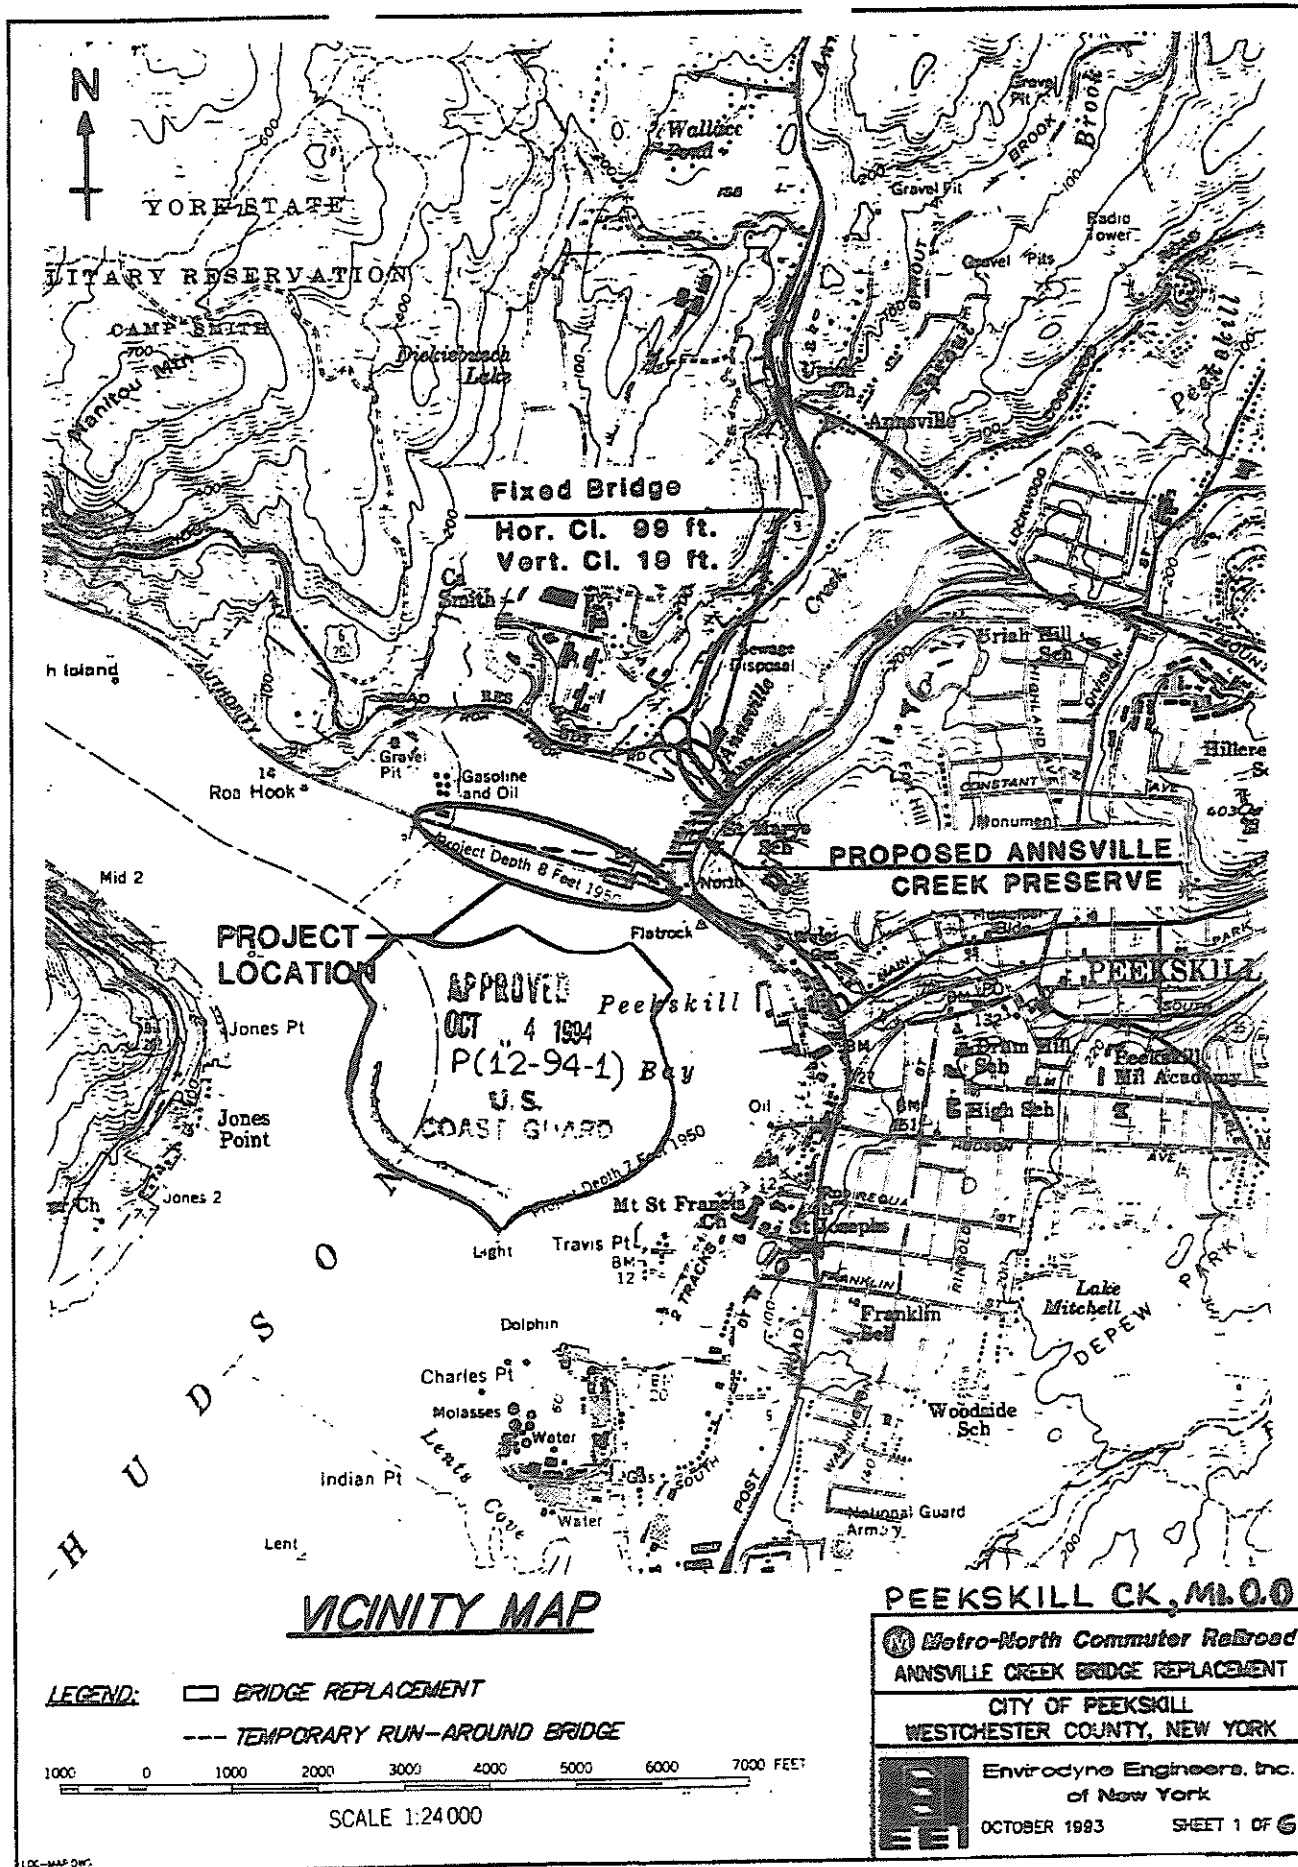

(12-94-1)

7. A bridge fendering system shall be installed and maintained in good condition by and at the expense of the owner of the bridge when so required by the District Commander. Said installation shall be for the safety of navigation and be in accordance with plans submitted to and approved by the District Commander prior to its construction.

8. When the proposed bridge is no longer used for transportation purposes, it shall be removed in its entirety or to an elevation deemed appropriate by the District Commander and the waterway cleared to the satisfaction of the District Commander. Such removal and clearance shall be completed by and at the expense of the owner of the bridge upon due notice from the District Commander.

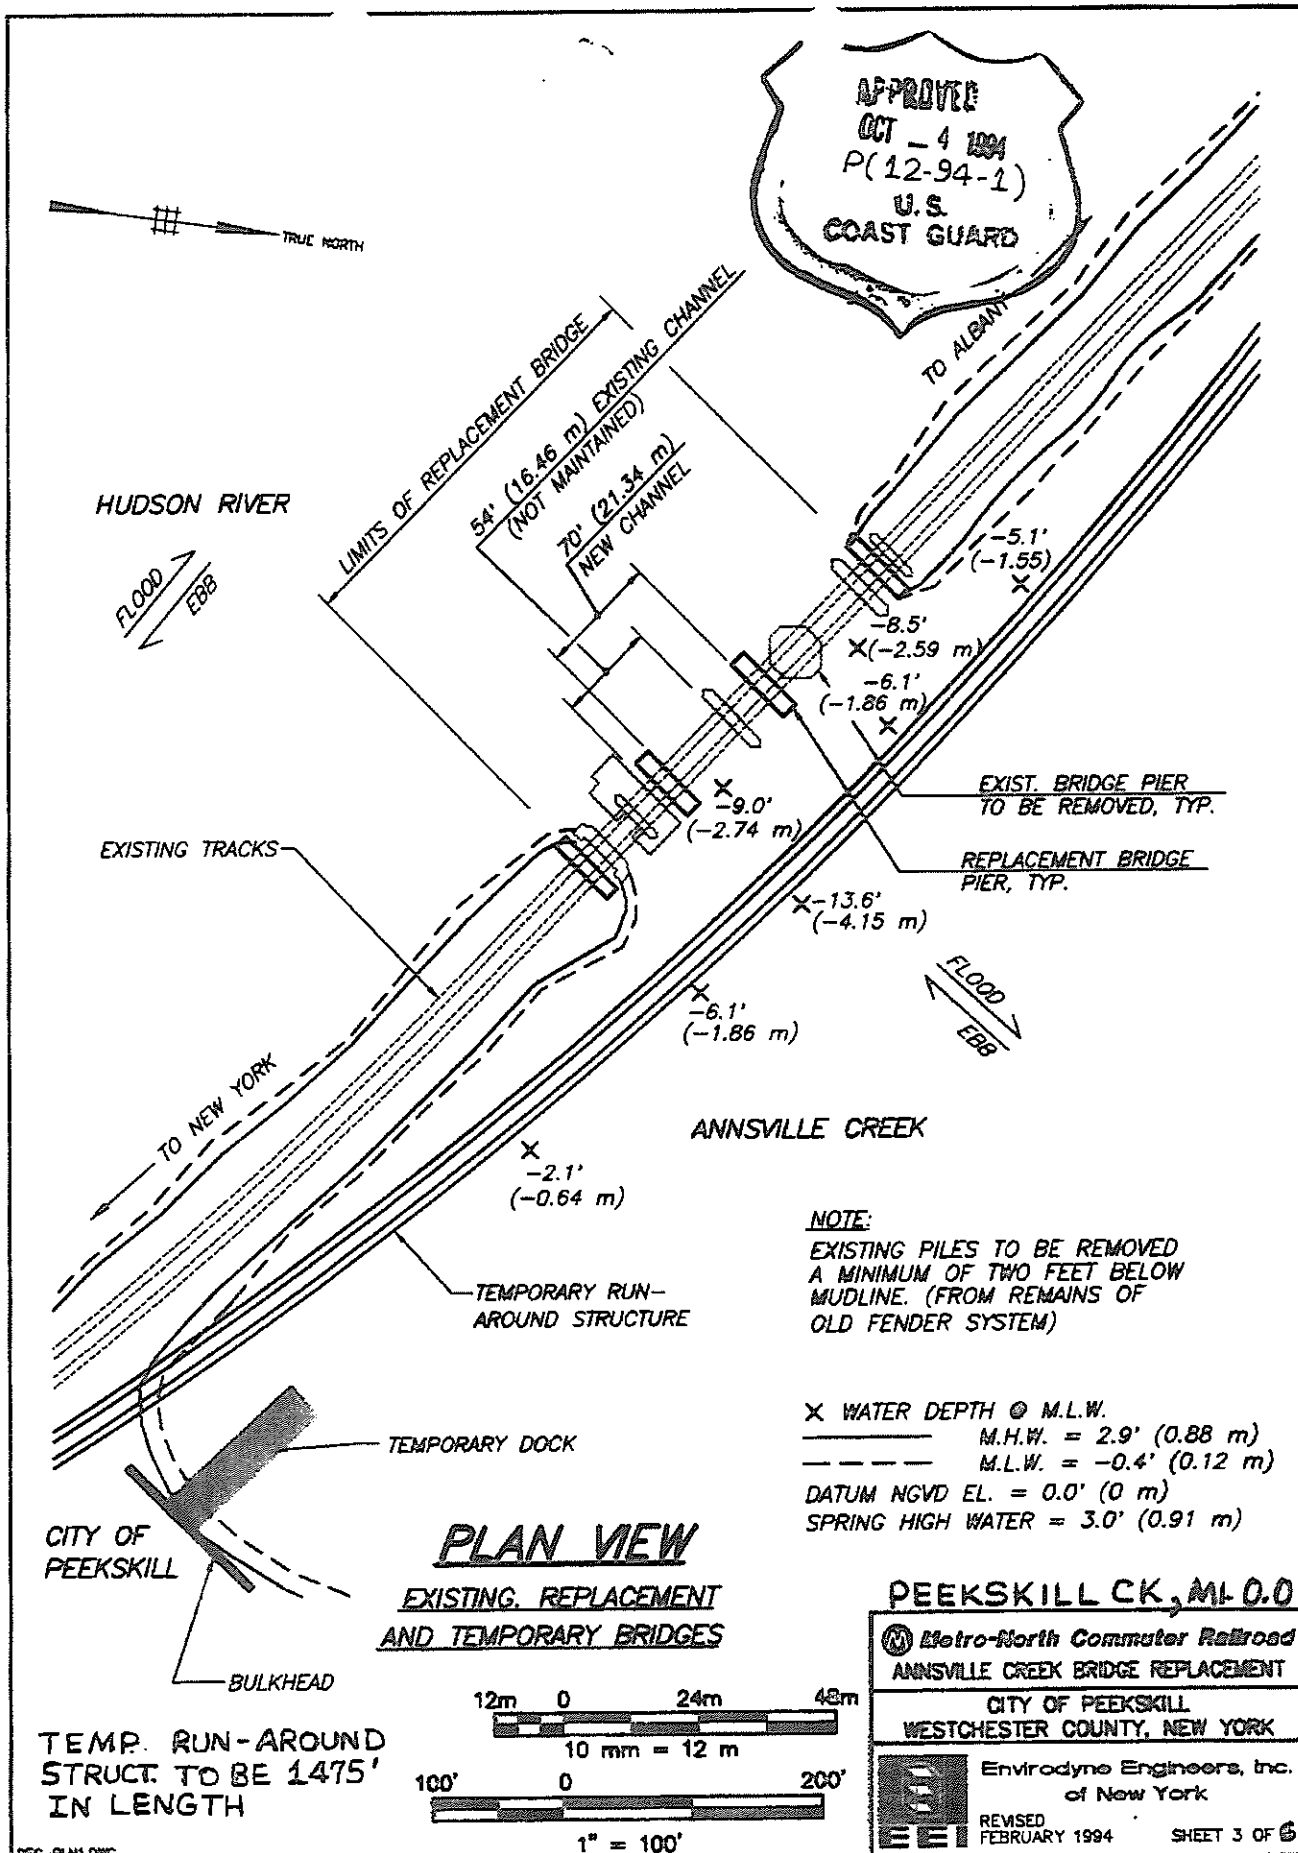

9. The approval hereby granted shall cease and be null and void unless construction of the bridge is commenced within three years and completed within five years after the date of this permit.

NEW YORK, N. Y. C.

1923

Bridges
21 70

Whereas, By an act of Congress, approved March 2, 1923,

entitled, "An Act Granting the consent of Congress to the Hudson River Bridge Company at Albany to maintain two bridges already constructed across the Hudson River,"

the HUDSON RIVER BRIDGE COMPANY

was authorized to ~~construct a bridge across~~ maintain and operate two bridges already constructed across the Hudson River at Albany, in the County of Albany, in the State of New York, the bridges to be deemed to have been constructed

in accordance with the provisions of the act of Congress entitled "An act to regulate the construction of bridges over navigable waters," approved March 23, 1906, whereby it is provided that such bridge shall not be built or commenced until the plans and specifications for its construction, together with such drawings and map of location thereof as may be required for a full understanding of the subject, have been submitted to and approved by the Chief of Engineers and by the Secretary of War;

And whereas, The said HUDSON RIVER BRIDGE COMPANY

has submitted ^{one of said} and approval plans, specifications, drawings, and map of location of ~~a bridge~~ ^{as} proposed to be built across said river at said place, ~~and as proposed to be modified,~~ which comply with the requirements of said act of March 23, 1906;

Now therefore, This is to certify that the proposed location and said specifications and the plans which are hereto attached are hereby approved by the Chief of Engineers and by the Secretary of War, pursuant to the above-mentioned acts of Congress, subject to the following conditions:

1. That the District Engineer of the Engineer Department at Large in charge of the district within which the bridge is to be ^{be} built may supervise its ^{re} construction in order that said plans shall be complied with.

2. That all work shall be so conducted that the free navigation of the waterway shall not be unreasonably interfered with; that the present navigable depths shall not be impaired; and that the channel or channels through the structure

RECORD OF TELEPHONE CALL

Job # 50377- NYS HSR Empire Corridor
Call From Andy Labruzzo (518) 473-2460
Call To Kevin Horgan
By Kevin Horgan

Date January 4, 2012
Of NYSDOS Division of Coastal Resources
Of HNTB

Subject Discussed

Andy returned my call inquiring about the limits of the designated inland coastal waterways. I asked if there are any specific limits of the designation or if the entire river listed is considered a designated waterway and if the designation includes tributaries and outlets.

Action to be Taken

NONE

Response:

In general, the entire waterway is considered part of the “designated waterway” and it does not include tributaries. However, the designation factor has no regulatory effect. Regulatory boundaries are determined at the local level through the local community’s participation in a Local Waterfront Revitalization Program (LWRP). If a single waterway enters through multiple communities, only those waterway sections in communities with a LWRP are regulated. The exception would be if there is a community that is participating in a LWRP that includes watershed planning that may extend to adjacent communities without a LWRP. Andy mentioned that there is a plan to complete a watershed plan for all of the Mohawk River. Andy suggested that we refer to the local LWRP’s to determine regulatory requirements for the

waterways but he also noted that if we had a specific area or waterway within our project area, he could provide us with additional information for that specific area or waterway.

Addie,

Thank you for the signed agreement, and for your patience. Please find attached a zipfile with four shapefiles of Natural Heritage data from within the half-mile buffers of the Empire Corridor, as depicted in the shapefiles you provided.

New York Natural Heritage provides these GIS data to HTNB under the auspices of the just-signed data agreement. We ask that any HTNB staff or contractors accessing or using the GIS data read the agreement and be familiar with its provisions, especially the provision that the data is for the internal use of HTNB and should not be distributed externally, nor should any maps or documents revealing the precise locations of rare species be made available to the public or other parties.

Also, please delete any older versions of Natural Heritage data from your systems.

The information below is also in the attached read_me document, which also includes an explanation of the attributes.

Let me know if you have any questions, and please confirm that you have received the data.

Overview of NY Natural Heritage data for HTNB for the Empire Corridor, 2021

Three of the shapefiles contain the locations of rare plants and animals and of significant natural communities which are documented in the New York Natural Heritage database within the half-mile buffers around the proposed Empire Corridor route and alternate routes as delineated in the shapefiles provided in 2021. In the shapefiles, each location of a species or community is represented as one or more polygons.

The shapefile NYNHP_HTNB_**species**_2021 contains records of rare plants and rare animals last documented since 1980, for which relatively precise locations are known, and whose species identification has been confirmed.

The shapefile NYNHP_HTNB_**potential**_2021 contains records of rare species last documented before 1980 (historical records), or for which relatively precise locations are not known, or for which the most recent information indicates that the occurrence may no longer be present, or for which the species identification has not been confirmed. For historical records, there is no recent information and their current status is unknown. If suitable habitat for these species is still present, it is possible the species may still be present, too. *Records with uncertain locations, including many historical*

records, are mapped with large polygons showing the potential area within which the plant or animal was collected or observed.

The shapefile NYNHP_HTNB_comms_2021 contains records of significant natural communities. Natural community occurrences in this shapefile are considered significant from a statewide perspective, by virtue of being of excellent or good quality, and/or of a rare community type. NY Natural Heritage considers these occurrences to have high ecological and conservation value.

The above three shapefiles contain documented locations of rare species and significant ecological communities. The lack of any records at a particular location does not necessarily mean that no rare species or significant community is present there.

The fifth shapefile, NYNHP_NG_vicinity_2021, contains those sections of the half-mile buffers around the Empire Corridor routes that are within one mile of bald eagle nests, within .81 mile of Blanding's turtle locations, within 1.5 miles of timber rattlesnake locations, within 2.5 miles of Indiana bat locations, within 1.5 miles of non-wintering Northern long-eared bat locations, or within 5 miles of Northern long-eared bat hibernacula locations. (The species and distance are listed in the attribute table.) While the documented locations of these species are often not within the half-mile buffer, these species regularly travel these respective distances and may potentially occur in the portions of the half-mile buffers shown in this shapefile; these portions are within NYSDEC's area of concern for these species. Within any of these portions where there is suitable habitat for a species, the potential impacts of any activities on the species may need to be considered.

More information about many of the rare and listed animals and plants in New York, including biology, identification, habitat, conservation, and management, are available online in Natural Heritage's Conservation Guides at www.guides.nynhp.org.

Information about many of the natural community types in New York, including identification, dominant and characteristic vegetation, distribution, conservation, and management, is available online in Natural Heritage's Conservation Guides at www.guides.nynhp.org. More technical descriptions are in Ecological Communities of New York State at <http://www.dec.ny.gov/animals/97703.html>.

Hello, Addie,

I meant to send this you last week – sorry for the delay. I'll be preparing a new GIS dataset for you, and it's been a while since I last provided data to you, so it's best to execute a new data agreement.

Attached is the draft agreement (using the new template as directed by DEC's legal office). As before, the most important provisions are that the data will be for HNTB's internal use only and the data are not to be passed on to any other party (without prior approval); and that no maps or documents revealing the precise locations of rare species will be published or made available to the public or to other parties.

If you have concerns or questions about any of the provisions, let me know. If the provisions are acceptable to you, please sign and return the agreement, upon which I can send you the updated data for the Empire Corridor.

Hi Nick,

Yes, to be consistent, we'd like to request the updated data for all the alignments in order to update the assessment performed in the Tier 1 Draft EIS (so it is an apples to apples comparison).

Also I had a question regarding the proposed rare species listings in 2019, I assume that the data does not incorporate recently proposed changes in listing status (that were suspended during the pandemic)?

Thank you!

Addie

Addie,
Thanks for the shapefiles!
I want to make sure I understand what you're requesting: Are you requesting updated Natural Heritage data for all alignments you provided in the shapefiles?

I can prepare a new data agreement in less than a day, and once a signed copy is returned I can provide the data as soon as I've done processing it. Let me know if I should be screening all the alignments or not, and then I will look over the data and get back to you.

Thanks,
Nick

Subject: FW: NYNHP Request

Hi Nick,

Please see attached the GIS files for the program alternatives for the High Speed Rail Empire Corridor Program. As outlined in the prior email, 90B ("90mph design" in the attached zipfile) is the Preferred Alternative that will be the focus of the Tier 1 Final EIS, but the Tier 1 Draft EIS examined the impacts of all program alternatives. Three of these files follow the same basic alignment along Empire Corridor (90A, 90 mph, and 110 mph), although 125 mph design has an entirely new alignment.

I believe that HNTB will be the only company needed on a Data Agreement. If needed, how long would it take to institute a new Data Agreement?

Thank you, please let us know if you should have any further questions or need additional information.

Sincerely,

Addie

Addie Kim

Overview of NY Natural Heritage data for HTNB for the Empire Corridor, 2021

These GIS data are provided to HTNB under the auspices of the data agreement signed in 2021. We ask that any HTNB staff or contractors accessing or using the GIS data read the agreement and be familiar with its provisions, especially the provision that the data is for the internal use of HTNB and should not be distributed externally, nor should any maps or documents revealing the precise locations of rare species be made available to the public or other parties.

There are four shapefiles. The shapefiles are in meters, UTM zone 18, NAD 83.

Three of the shapefiles contain the locations of rare plants and animals and of significant natural communities which are documented in the New York Natural Heritage database within the half-mile buffers around the proposed Empire Corridor route and alternate routes as delineated in the shapefiles provided in 2021. In the shapefiles, each location of a species or community is represented as one or more polygons. See below for definitions of the attributes.

The shapefile NYNHP_HTNB_**species**_2021 contains records of rare plants and rare animals last documented since 1980, for which relatively precise locations are known, and whose species identification has been confirmed.

The shapefile NYNHP_HTNB_**potential**_2021 contains records of rare species last documented before 1980 (historical records), or for which relatively precise locations are not known, or for which the most recent information indicates that the occurrence may no longer be present, or for which the species identification has not been confirmed. For historical records, there is no recent information and their current status is unknown. If suitable habitat for these species is still present, it is possible the species may still be present, too. *Records with uncertain locations, including many historical records, are mapped with large polygons showing the potential area within which the plant or animal was collected or observed.*

The shapefile NYNHP_HTNB_**comms**_2021 contains records of significant natural communities. Natural community occurrences in this shapefile are considered significant from a statewide perspective, by virtue of being of excellent or good quality, and/or of a rare community type. NY Natural Heritage considers these occurrences to have high ecological and conservation value.

The above three shapefiles contain documented locations of rare species and significant ecological communities. The lack of any records at a particular location does not necessarily mean that no rare species or significant community is present there.

The fifth shapefile, NYNHP_NG_**vicinity**_2021, contains those sections of the half-mile buffers around the Empire Corridor routes that are within one mile of bald eagle nests, within .81 mile of Blanding's turtle locations, within 1.5 miles of timber rattlesnake locations, within 2.5 miles of Indiana bat locations, within 1.5 miles of non-wintering Northern long-eared bat locations, or within 5 miles of Northern long-eared bat hibernacula locations. (The species and distance are listed in the attribute table.) While the documented locations of these species are often not within the half-mile buffer, these species regularly travel these respective distances and may potentially occur in the portions of the half-mile buffers shown in this shapefile; these portions are within NYSDEC's area of concern for these species. Within any of these portions where there is

suitable habitat for a species, the potential impacts of any activities on the species may need to be considered.

More information about many of the rare and listed animals and plants in New York, including biology, identification, habitat, conservation, and management, are available online in Natural Heritage's Conservation Guides at www.guides.nynhp.org.

Information about many of the natural community types in New York, including identification, dominant and characteristic vegetation, distribution, conservation, and management, is available online in Natural Heritage's Conservation Guides at www.guides.nynhp.org. More technical descriptions are in Ecological Communities of New York State at <http://www.dec.ny.gov/animals/97703.html>.

Fields in Attribute Table

Note: Element occurrences are documented, observed locations of rare plants, rare animals, rare or significant natural ecological communities, and concentration areas of groups of animal species.

EO_ID The identifier for the element occurrence in the NY Natural Heritage database.

Sensitive Data sensitive: While no NY Natural Heritage data should be made available for general public use, this field indicates whether the precise location of the element occurrence is especially sensitive and greater care should be taken to restrict its public distribution. If the value is **Y = Yes, the element is one of those considered most subject to collection and disturbance if its identity and location are publicized, and so the data are especially sensitive.**

Scien_Name Scientific name: For plants and animals, the New York State scientific name of the species. For ecological communities*, the New York Natural Heritage name of the community type. For animal concentration areas, the New York Natural Heritage name of the type of animal concentration area.

Commonname Common name: For plants and animals, the New York State common name of the species. For ecological communities and animal concentration areas, the New York Natural Heritage common name of the community type or animal concentration area, respectively.

Location The name of the site where the element occurrence is, or was, located.

Locatn_Use: Location Use: For animals, typically migratory animals, which use different areas at different times of year, the location use class indicates the specific season or behavior associated with this location; e.g., Breeding, Nonbreeding for birds; Hibernaculum, Maternity Colony, or Bachelor Colony for bats.

Group_Name The general group of animals, plants, or community types the species or community belongs to.

- NY_listed** NY State protected status: Category of legal protection under New York State Environmental Conservation Law and regulations.
For animals: Endangered, Threatened, Special Concern, No Open Season, Protected Bird, Protected by Law, Game (= has open season), or Unlisted.
For plants: Endangered, Threatened, Rare, Vulnerable (= Exploitably Vulnerable), or Unlisted.
- US_listed** Federal listing status: Listing status under the federal Endangered Species Act: Endangered, Threatened, or Candidate.

For next three fields, see also Explanation of Conservation Ranks at the end of this document.

- S_rank** The Heritage state conservation rank of the species or community.
- S_rank_dsc** A one or two-word translation of the S_Rank code in the previous field.
- G_rank** The Heritage global conservation rank of the species or community.

- Last_date** The date of the most recent observation of the element occurrence at this Location, as documented in the Natural Heritage databases. The format is most often YYYY-MM-DD.

- Comments** For species, comments about the number of individuals observed, their condition, and the condition of the habitat. For ecological communities, comments regarding the reasons for the occurrence's significance and the relative quality of the occurrence, particularly in regards to area, condition, and landscape context. The first 255 characters of the description are in the first column **Comments**; if necessary, the second 255 characters are in the second column **Comments2**. Longer values will be truncated.

- Id_confirmed** Whether the taxonomic identification of the element has been confirmed by a reliable person. Values are: Y = identification has been confirmed; ? = identification has been checked but is still uncertain; or N = identification has not been checked and needs verification.

- ERAccuracy** A measure of the level of mapping precision; values are Very High (mapped location is known to be correct to within 6 m), High, Medium, Low, and Very Low.

- Mangd_area** Managed Area: Lands managed for conservation (federal, state, local, private) on which the species or community occurs or occurred.

- County** The county(ies) in which the element occurrence is, or was, located.
- Town** The town(s) in which the element occurrence is, or was, located.

- Elem_Group** Vertebrate Animal, Invertebrate Animal, Vascular Plant, Nonvascular Plant (moss), Community, or Animal Assemblage. (Animal assemblages are multi-species animal concentration areas, such as bat hibernacula and waterfowl concentration areas).

Site_desc Site description: A description of the general area and habitat where the element occurrence is found. The first 254 characters of the description are in the first column **Sitedesc1**; if necessary, the second 254 characters are in the second column **Sitedesc2**; and, if necessary, the third 254 characters are in the third column **Sitedesc3**. Longer values will be truncated.

EXPLANATION OF CONSERVATION RANKS used by NEW YORK NATURAL HERITAGE

HERITAGE GLOBAL AND STATE CONSERVATION RANKS: Each species or community has a global and state rank as determined by the NY Natural Heritage Program. These ranks carry no legal weight. The global rank reflects the rangewide conservation status of the species or community; the state rank reflects the status within New York State.

STATE RANK:

S1 = Critically imperiled in New York State. Typically 5 or fewer occurrences, very few remaining individuals, acres, or miles of stream, or some factor of its biology making it especially vulnerable in New York State.

S2 = Imperiled in New York State. Typically 6 to 20 occurrences, few remaining individuals, acres, or miles of stream, or factors demonstrably making it very vulnerable in New York State.

S3 = Uncommon in New York State. Typically 21 to 100 occurrences, or limited acreage or miles of stream in New York.

S4 = Apparently secure in New York State.

S5 = Demonstrably secure in New York State.

SH = Historically known from New York State, but not seen in the past 35 years.

SX = Apparently extirpated from New York State.

SU = Conservation rank not assigned.

B after one of the above ranks indicates the status rank is for breeding populations only.

N after one of the above ranks indicates the status rank is for nonbreeding wintering populations only.

GLOBAL RANK :

G1 = Critically imperiled globally because of extreme rarity (5 or fewer occurrences), or very few remaining acres or miles of stream) or especially vulnerable to extinction because of some factor of its biology.

G2 = Imperiled globally because of rarity (6 - 20 occurrences, or few remaining acres, or miles of stream) or very vulnerable to extinction throughout its range because of other factors.

G3 = Either rare and local throughout its range (21 to 100 occurrences), or found locally (even abundantly at some of its locations) in a restricted range (e.g. a physiographic region), or vulnerable to extinction throughout its range because of other factors.

G4 = Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.

G5 = Demonstrably secure globally.

GH = Historically known, with the expectation that it might be rediscovered. GX = Species believed to be extinct.

Range ranks, e.g. S1S2, indicate not enough information is available to distinguish between two ranks.

? = a question exists about the rank. Q = a question exists whether or not the species or variety is a good taxonomic entity.

T-ranks (T1 - T5) are defined the same as G-ranks (G1 - G5), but refer only to the rarity of the subspecies or variety.

Consultation Code: 05E1NY00-2022-SLI-0765

Event Code: 05E1NY00-2022-E-02959

Project Name: Empire Corridor

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). This list can also be used to determine whether listed species may be present for projects without federal agency involvement. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list.

Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the ESA, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC site at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list. If listed, proposed, or candidate species were identified as potentially occurring in the project area, coordination with our office is encouraged. Information on the steps involved with assessing potential impacts from projects can be found at: <http://www.fws.gov/northeast/nyfo/es/section7.htm>

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the Services wind

energy guidelines (<http://www.fws.gov/windenergy/>) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm>; <http://www.towerkill.com>; and <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html>.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the ESA. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

New York Ecological Services Field Office

3817 Luker Road
Cortland, NY 13045-9385
(607) 753-9334

This project's location is within the jurisdiction of multiple offices. Expect additional species list documents from the following office, and expect that the species and critical habitats in each document reflect only those that fall in the office's jurisdiction:

Long Island Ecological Services Field Office

340 Smith Road
Shirley, NY 11967-2258
(631) 286-0485

Project Summary

Endangered Species Act Species

There is a total of 7 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries¹, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

Mammals

NAME	STATUS
Indiana Bat <i>Myotis sodalis</i> There is final critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/5949	Endangered
Northern Long-eared Bat <i>Myotis septentrionalis</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9045	Threatened

Birds

NAME	STATUS
Piping Plover <i>Charadrius melodus</i> Population: [Atlantic Coast and Northern Great Plains populations] - Wherever found, except those areas where listed as endangered. There is final critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/6039	Threatened

Reptiles

NAME	STATUS
Eastern Massasauga (=rattlesnake) <i>Sistrurus catenatus</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/2202	Threatened

Insects

NAME	STATUS
Karner Blue Butterfly <i>Lycaeides melissa samuelis</i> There is proposed critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/6656	Endangered
Monarch Butterfly <i>Danaus plexippus</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9743	Candidate

Flowering Plants

NAME	STATUS
Houghton's Goldenrod <i>Solidago houghtonii</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5219	Threatened

Critical habitats

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

1. Framework Agreement Concerning Certain Rights and Responsibilities with Respect to New York High Speed Rail

This page intentionally left blank.

CSX TRANSPORTATION, INC.

and

NEW YORK STATE DEPARTMENT OF TRANSPORTATION

**FRAMEWORK AGREEMENT CONCERNING CERTAIN RIGHTS AND
RESPONSIBILITIES WITH RESPECT TO NEW YORK HIGH SPEED RAIL**

This Framework Agreement Concerning Certain Rights and Responsibilities with Respect to New York High Speed Rail (“Framework Agreement”) is entered into as of May 28, 2010, by and between CSX TRANSPORTATION, INC. (“CSXT”), a Virginia corporation whose principal offices are located at 500 Water Street, Jacksonville, Florida, 32202, and the NEW YORK STATE DEPARTMENT OF TRANSPORTATION (“New York”), whose principal offices are located at 50 Wolf Road, Albany, NY 12205.

Introduction and Purpose

1. This Framework Agreement is to set forth and memorialize the parties’ shared understanding with respect to certain essential elements of the planning and potential implementation of enhanced intercity or high speed passenger rail service (collectively referred to herein as “high speed intercity passenger rail service”) on or adjacent to property currently owned by CSXT in the State of New York. It is the intent of the parties to recognize the national goal of expanding high speed intercity passenger rail, consistent with CSXT’s legal and fiduciary responsibilities, and to cooperate fully in achieving that goal consistent with the Framework Agreement.
2. This Framework Agreement articulates the principles for the future course of dealing between the parties concerning any implementation of high speed intercity passenger rail service in New York.
3. With regard to the project described in the Agreement for Progressing a Tier 1 Environmental Impact Statement (EIS) on the Empire Corridor, which is being executed simultaneously, this Framework Agreement is not intended to foreclose the EIS’s consideration of particular approaches. The EIS will provide a basis for determining alternatives, and by agreeing to progress the EIS, the parties are in no way committing to implementation of the project or binding themselves to any further steps concerning the project. That project and the projects identified in Attachment A are collectively referred to herein as “the Projects.” The parties agree that NYSDOT is progressing the ARRA high speed intercity passenger rail projects approved and funded by the Federal Railroad Administration and set forth in Attachment A, subject to the parties (and Amtrak, if applicable) entering into all necessary implementing project agreements.
4. Specifically, this Framework Agreement identifies four core principles that are common to all freight and passenger rail interface in the United States. Those are safety, capacity, liability and compensation. This Framework Agreement acknowledges those issues, acknowledges that there is substantial precedent for resolving them and commits the parties to work cooperatively, consistent with law and precedent to do so if the Projects are undertaken.

Safety, Capacity, Liability and Compensation

5. **Safety.** New York acknowledges that CSXT has current safety design guidelines for passenger trains operating on CSXT property at speeds higher than 90 mph between Buffalo and Hoffmans, NY that require a separated and dedicated track(s) for the passenger services constructed. New York further acknowledges that it will make every effort to follow CSXT's guidelines, or to work with CSXT to put in place other system safety improvements that result in a level of safety equivalent to or better than current CSXT guidelines, provided that in all circumstances CSXT shall have the right to make the final determination as to safe uses of its property. Although CSXT is willing to explore exceptions to its current safety design guidelines, CSXT and New York agree that any such exceptions shall be limited in number and scope, and must be mutually agreed upon by the parties. Moreover, the parties acknowledge that research and rulemaking with respect to the interface of freight and high speed rail in the United States is under study and may evolve. In all cases, and notwithstanding any other provision of this Framework Agreement, CSXT will abide by legal standards and maintain sole discretion with respect to the safety and use of its property.

6. **Capacity.** CSXT and New York acknowledge that CSXT, as a wholly-owned subsidiary of a public corporation, has the responsibility to solely determine the freight capacity that CSXT must retain to accommodate future operations. In making this determination, CSXT will take into account the results of the EIS, as well as the views of third parties, including, without limitation, the Federal Railroad Administration, the State of New York, Amtrak, the Port of New York/New Jersey and customers.

7. **Liability.** New York acknowledges that if the Projects are implemented, CSXT will require adequate protections from potential liability arising from the operation of passenger rail service, consistent with law and precedent.

8. **Compensation.** New York acknowledges that the CSXT corridor that is the subject of this Framework Agreement is today the single busiest on the CSXT network and has tremendous opportunity for additional freight demand, including from the expansion of the Panama Canal. Accordingly, the property that would be impacted by the Projects is among the most valuable freight corridors in the United States. New York acknowledges that it has a legal and constitutional obligation to justly compensate CSXT for any of its property rights acquired or used by New York, as well as for any diminishment in value of those rights to the extent permitted by law.

This Agreement has the concurrence of the authorized officials of both parties as of the dates show below.

CSX TRANSPORTATION, INC.
And
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
AGREEMENT
FOR PROGRESSING A

TIER 1 ENVIRONMENTAL IMPACT STATEMENT ON THE EMPIRE CORRIDOR

This Agreement for Progressing an Environmental Impact Statement ("EIS Agreement") is entered into as of May 28, 2010, by and between the NEW YORK STATE DEPARTMENT OF TRANSPORTATION ("NYSDOT" or "State"), whose principal offices are located at 50 Wolf Road, Albany, NY 12205, and CSX TRANSPORTATION, INC. ("CSXT"), a Virginia corporation whose principal offices are located at 500 Water Street, Jacksonville, Florida 32202.

Explanatory Statement

- A. The purpose of this EIS Agreement is to set forth principles of cooperation between the parties in connection with undertaking a Tier 1 Service Level National Environmental Policy Act ("NEPA") Environmental Impact Statement ("EIS") to consider the enhancement of high speed intercity passenger rail service between Niagara Falls, N.Y. and Albany, N.Y. with through or connecting service to Pennsylvania/Moynihan Station in New York City ("the Corridor") and other possible destinations, consistent with preserving and growing the valuable freight service and opportunities of CSXT and its stakeholders with respect to its property.
- B. The EIS will provide a basis for determining alternatives with respect to the basic engineering, design, and environmental impacts of the project described above. Concurrent with the execution of this EIS Agreement, the parties are executing a Framework Agreement Concerning Rights and Responsibilities ("Framework Agreement") that provides an overview of certain essential rights and responsibilities of the parties with respect to this project and others.
- C. New York State has a vital interest in delivering high speed intercity passenger rail to the Corridor and is dedicated to optimizing train speed in the Corridor in ways that will best serve the public's need and desire for safe and reliable passenger rail service while at the same time supporting and growing the substantial public benefits of freight rail in New York.
- D. CSXT, as a wholly-owned subsidiary of a public corporation, has legal and fiduciary responsibilities to preserve and grow freight rail services and to maximize the safe and efficient uses of its property.
- E. NYSDOT is presently undertaking the development of a Tier 1 Service Level National Environmental Policy Act Environmental Impact Statement, with the Federal Railroad Administration ("FRA") as the lead agency, to consider the enhancement of high-speed intercity passenger rail service on the Corridor including the introduction of enhanced operations on that portion of the Corridor between Albany-Rensselaer, Schenectady and

Niagara Falls, New York (the “Empire Corridor West” or “ECW”). The EIS will study possible additions and/or enhancements to track and other infrastructure to allow for intercity passenger rail trains that are capable of traveling at maximum authorized speeds of at least 110 miles per hour (“mph”) as defined by 49 U.S.C. section 26106(b)(4), as well as other enhancements. The parties recognize that the CSXT right of way within the Corridor is the single busiest on the CSXT network. As such, it is an essential part of an interdependent nationwide rail network and is among the most valuable freight routes in the United States. The parties recognize that the alternatives studied may require the acquisition of property rights from CSXT or others. As required by NEPA, the EIS will evaluate all reasonable alternatives including options that comply with CSXT’s design and safety standards, guidelines and policies for commingled passenger and freight operations, including the requirement of a separated and dedicated track for any passenger trains operating at speeds in excess of 90 mph, with a minimum of 30 feet measured from the center line of the freight track to the center line of the proposed passenger track. The EIS will also evaluate a no-build alternative, and will consider the substantial stakeholder interests in freight fluidity, including without limitation the interests of the Port of New York/New Jersey and the City of New York. In evaluating those alternatives that comply with CSXT’s design and safety standards, guidelines and policies, the parties understand that there may be places along the Corridor where meeting CSXT’s standards, guidelines and policies is not possible within CSXT’s existing right of way; therefore, the EIS will evaluate other options including, but not limited to:

- speed restrictions
- environmental mitigation
- exceptions to CSXT’s standards, guidelines and policies
- property acquisition

- F. The EIS will draw upon: (1) a market study of ridership demand for such services on the Corridor (the “Market Study”); (2) an operational analysis of the Corridor previously undertaken by NYSDOT and others for railroad operations between Schenectady, Poughkeepsie and New York, NY (the “Hudson Line Operational Analysis”), which resulted in the Hudson Line Corridor Rail Transportation Plan and its preferred scenario of capital improvements dated November 2005 (the “Hudson Line Study”); and (3) additional operational analysis of the Corridor between Schenectady and Niagara Falls, NY (the “ECW Operations Analysis”). The EIS, the Market Study and the ECW Operational Analysis are referred to collectively as the “Study”.
- G. CSXT, as the owner of much of the right of way within the scope of the Study, is willing to assist NYSDOT in connection with the Study, under the terms set forth by this EIS Agreement.
- H. The parties understand that the Study will form the basis for the development of a Transportation Investment Plan (“TIP”), to be prepared generally consistent with the guidance previously published by FRA entitled “Corridor Transportation Planning Guide.” The TIP will identify the infrastructure and/or operational improvements necessary to permit safe and reliable intercity passenger rail service consistent with the concomitant public interest in the preservation and enhancement of safe and reliable rail freight operations between Buffalo, N.Y. and Selkirk, N.Y. for both existing and future freight customers along the line and through freight service, including service to and from the Port of New York/New Jersey. The development of a TIP will be the subject of a further agreement between the

parties as to their roles and responsibilities. Negotiation of the TIP agreement will begin immediately upon the execution of this EIS Agreement.

- I. The parties understand that the National Railroad Passenger Corporation (“Amtrak”) provides intercity passenger rail service on the Corridor and will be a necessary participant in the undertaking of the Study. The negotiation of the TIP, including responsibility of operations and maintenance of capital improvements will include Amtrak.

Section 1: General Matters

- a. The provisions of this EIS Agreement shall not be determinative of the terms and conditions of any further agreements between the parties as to the implementation of the improvements or the rail service that are derived from the Study. The results of the Study do not, and will not bind either party to any terms or conditions related to the contemplated project, including any expansion of passenger rail operations or infrastructure changes to CSXT's rail corridors. The parties acknowledge that further studies may be necessary and desirable to the extent that the Study does not sufficiently address the impact of rail service and/or the rail infrastructure enhancements required to accommodate the same. NYSDOT and CSXT acknowledge and understand the obligations contained in this EIS Agreement are limited to developing the Study, in accordance with this EIS Agreement. This EIS Agreement creates no obligation on the part of either party to otherwise pursue or advance any particular project or to enter into any further agreements to advance such projects.
- b. This EIS Agreement will commence on the date signed by the parties and terminate when the Study is completed and accepted by the FRA. Either party may terminate its participation in the Study by delivery of 30 days prior written notice to the other, stating the reasons for such termination.

Section 2: NYSDOT Consultants and Subconsultants

NYSDOT has secured the services of HNTB New York Engineering and Architecture, P.C., as well as sub-consultants Louis T. Klauder & Associates and W. F. Keeney & Associates at its sole expense (collectively, “NYSDOT Consultants”), to perform the Study and to develop alternatives that best meet the future needs of the users of the Corridor. The term of the NYSDOT – HNTB New York Engineering and Architecture, P.C. Railroad Retainer Agreement is 3/01/2010 to 3/01/2015. It is expected that the Study will be completed in 2012.

Section 3: Operations Analysis Parameters and Methodology.

- a. The objective of the Study's ECW Operations Analysis is to provide a comprehensive analysis of proposed alternatives for improving rail service on the ECW that connects Albany-Rensselaer Station with Syracuse, Rochester, Buffalo and Niagara Falls, including important connections west of Buffalo and north of Syracuse. Also included is the important connection from Hoffmans (where the ECW continues east to Albany-Rensselaer Station) to Selkirk Yard, the major rail freight classification yard for New York and New England.
- b. The Study's ECW Operations Analysis will include a comprehensive computerized railroad network simulation model of both existing and future train operations on the

ECW from Albany-Rensselaer to the Canadian border in Niagara Falls, NY. The Rail Traffic Controller (“RTC”) computer rail network simulation analysis package shall be used for the Study’s ECW Operations Analysis.

- c. Development of the Base simulation model, reflecting 2008 ECW operations, was substantially completed as part of another project and has already received preliminary “sign off” by CSXT conditioned on correction of some deficiencies in the model identified by CSXT which NYSDOT has agreed to implement. A Base Case RTC validation will be completed using CSXT actual point to point data. Some work is needed to provide a broader set of outputs to support the Study. The Base simulation model will not be updated to reflect current operations on the Corridor because CSXT train volumes were higher in 2008 than they are at present.
- d. The Study’s ECW simulation model will include detailed simulation of all intercity passenger trains and freight rail movements (both local and long distance) within the ECW.
- e. The Study’s future ECW simulation model scenarios will reflect evaluation of Study alternatives that include growth in passenger and freight rail service as well as required infrastructure improvements. Feasibility assessments of alternatives with significant infrastructure improvements will balance costs and environmental impacts with predicted rail network operational benefits related to capacity, travel time, train schedule reliability, rail safety, and cost effectiveness.
- f. The Study’s ECW Operations Analysis will include the following CSXT trackage that is part of the Corridor and connecting rail routes:
 - Portion of CSXT’s Hudson Subdivision: Rensselaer (CP 142) to Schenectady (CP 160) and Hoffmans (CP 169),
 - CSXT’s Selkirk Subdivision [Selkirk Yard to Hoffmans (CP 169) junction with the Hudson Subdivision) and Amsterdam (CP 175)],
 - CSXT’s Mohawk Subdivision [Amsterdam (CP 175) to St. Lawrence Subdivision Junction (CP 291) and Syracuse (SP 296)],
 - Portions of CSXT’s St. Lawrence Subdivision/Former Montreal Secondary [Syracuse (CP 291) to Woodard (CP-W),
 - CSXT’s Rochester Subdivision [Syracuse (CP 296) to Buffalo (CP 429)],
 - CSXT’s West Shore Subdivision [Fairport (CP 359) to Chili (CP 382)] which provides an important freight bypass around Rochester,
 - CSXT’s Buffalo Terminal Subdivision [Buffalo (CP 429) to CP 437 and Lake Shore Subdivision (CP 2)],
 - CSXT’s Niagara Subdivision, [Buffalo (CP 437) to Niagara Falls junction with CPR and CN (CP 28)], and

- Additional trackage in the Buffalo Terminal area – the Belt Line, Frontier Yard (lead tracks only), International Bridge and Old Compromise Line.

In all cases where trains can enter or leave the ECW territory "at speed" (using power switches), the Study's EIS Operations Analysis territory shall be extended so as to support this type of simulation operation. Where distant (approach) signals are provided – typically one to two miles from the ECW junction point – they shall be included in the operations analysis territory. Where replacement of hand-throw switches with power switches is identified as a potential improvement in the ECW territory, the "before and after" analysis shall be conducted starting at least one mile from the ECW junction point.

Where freight yard operations impact the ability of trains to achieve mainline Maximum Authorized Speed (MAS), ECW route yard tracks, including arrival/departure tracks, will be represented in the network description.

- g. With direct input and participation of CSXT, the Study will evaluate multiple alternatives that feature different passenger service levels, a range of future rail service levels, and capital improvements to existing CSXT infrastructure, capital improvements to new infrastructure within the CSXT right of way and capital improvements to new infrastructure partly or wholly outside of the CSXT right of way. The Study will identify a preferred alternative that provides the greatest benefits for safe and efficient rail operations, freight rail customers and the traveling public, while controlling capital costs and minimizing environmental impacts. To the extent possible, impacts of the impending implementation of Positive Train Control will be included.
- h. The Study's ECW Operations Analysis will use 2035 as future year for evaluation of rail operations. The Study's ECW Operations Analysis will provide the basis for a Service Development Plan that outlines how capital improvements and increased rail operations will be phased over time, given capital funding constraints, construction timeframes and the need to maintain fluid rail operations on the ECW at all times.
- i. Each RTC simulation model run will simulate seven consecutive measured operating days across the ECW plus one day warm up and one day cool down with randomization.
- j. The NYSDOT Consultant shall provide CSXT with all completed RTC Case (database) files, including the version of the RTC software used in the simulation. CSXT may run additional simulations for longer durations and alternative randomization inputs. At the discretion of CSXT, CSXT may provide the NYSDOT Consultant with the network simulation output data and/or summary document and the NYSDOT Consultant will incorporate CSXT's inputs into the Study's EIS technical appendices, as applicable.

Section 4: Study Management Approach

- a. NYSDOT and NYSDOT Consultants have entered into an agreement that outlines the Scope of Work for the Study, including roles and responsibilities of each participant. NYSDOT will manage the overall effort, including assigning a contract manager for the administration of the consultant services. NYSDOT will assign appropriate technical and managerial staff, as required, to manage or direct the advancement of the Study.

- b. FRA is the lead federal agency for purposes of the Study and under federal law is responsible for the scope and content of the EIS. The parties recognize that the independence and integrity of the EIS is essential to the development of a sound document and that, as it does for all of its EISs, the FRA will play a lead role in determining the scope and content of the document.
- c. CSXT (pursuant to this EIS Agreement), the National Passenger Railroad Corporation (Amtrak), FRA and other governmental agencies will provide technical guidance and support to NYSDOT and NYSDOT Consultants.

Section 5: Study Coordination

- a. In order to progress the Study, NYSDOT Consultants will need to perform field reconnaissance such as (but not limited to) measuring track centers, reviewing locations along the right-of-way for possible historic structures, wetlands and other constructability concerns, identifying bridge abutment setbacks and other design constraints affecting the ability to add new trackage. CSXT agrees to provide access to railroad property for Study purposes subject to the conditions set forth in this EIS Agreement. NYSDOT Consultants will be responsible for obtaining and paying all fees for Right-of-Entry Permits from CSXT, including but not limited to: providing the applicable general liability and railroad protective liability insurance, executing the acknowledgement statements contained on the permits, participating in railroad-sponsored safety training and making arrangements for obtaining any required railroad flagging services. It is anticipated that NYSDOT Consultants will perform field reconnaissance trips over the life of the Study. NYSDOT or its consultants will bear all CSXT costs related to the field reconnaissance trips.
- b. NYSDOT Consultants will provide CSXT with sufficient advance notice, usually no less than 14 days, when they desire to gain access to railroad property for the purpose of performing field reconnaissance. The timing of any field reconnaissance trips will depend upon the availability of CSXT personnel to protect those entries onto CSXT property.
- c. NYSDOT Consultants will group their requests for access to railroad property into geographically-compatible groupings in order to maximize efficient access to the Corridor (grouping nearby locations within one railroad Subdivision). NYSDOT Consultants will be required to execute a non-disclosure agreement with CSXT for all information deemed confidential by CSXT. CSXT agrees to provide reasonable requested Corridor source information in a timely manner.
- d. CSXT will provide certain available engineering drawings and maps, to the extent practicable and to the extent not previously provided to NYSDOT, for use by NYSDOT and NYSDOT Consultants in development of the Study. These drawings may include track charts, real estate valuation maps and other documents mutually agreed by the Parties.
- e. Any information provided to NYSDOT will be subject to disclosure under the Freedom of Information Law, unless the information is confidential financial statements, balance sheets, trade secrets or revenue and cost projections that CSXT can demonstrate is

exempt from disclosure under the New York State Freedom of Information Law, the federal Freedom of Information Act, the federal Interstate Commerce Act or other laws administered by the Surface Transportation Board or the Federal Railroad Administration, and CSXT makes a timely request for exemption from disclosure in accordance with such laws.

Section 6: Notices

All notices and Certificates of Insurance shall be mailed to the following addresses:

A. To CSXT:

(1). Certificates of Insurance:

Walter D. Tyler
Insurance Department
CSX Transportation
500 Water Street (J150)
Jacksonville, FL 32202

(904) 366-5090/ Fax (904) 245-2203

(2). All Notices and Communications pertaining to this Statement:

Evan Bell
Director Operations Planning
CSX Transportation
500 Water Street (J315)

Commenter	Bullock, Doug, Committee Chair of Mass Transit, Albany County Legislator
Comment E-1-1	<p>In September of 2012, the Albany County Legislature passed a resolution in support for restored Bicycle and Pedestrian accommodations on a rebuilt Livingston Avenue Bridge. The County has made significant investment to provide residents and visitors with an attractive, safe, inviting, and healthy network of trails and open spaces along the Hudson River Waterfront. Each day thousands of County residents use the waterfront as a place to play, exercise, and enjoy the scenery of the Hudson River shore. The County has made significant investment to build and maintain the Corning Preserve Bike Hike Trail, and in the near future the County anticipates cutting the ribbon on a 9-mile trail from the Port of Albany west to Voorheesville. This trail could one day connect to the Corning Preserve and via the Bridge, connect to trails planned for Rensselaer County. For decades the Corning Preserve has been a centerpiece of downtown activity and tourism, yet, it is difficult and harrowing for those on bike, foot, or in a wheelchair to cross the river. The replacement of the Livingston Avenue Bridge provides an opportunity to create a more attractive, safer, and more enjoyable non-motorized connection the waterfront on both sides of the river. The existing walkway once provided this access. With a new bridge comes the opportunity for a new, 21st century walkway. Not completing the walkway during the overhaul today, could mean an expensive retrofit down the road--or worse--no future accommodation. Potential conflicts between rail traffic and walkers & bicyclists can be eliminated with proper engineering of the facility. The new bridge should carry on the County's commitment to provide excellent bike and pedestrian facilities to our residents and visitors.</p>
Response	<p>Thank you for your comments and support for the upgrade of the Livingston Avenue Bridge. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. Including accommodations for pedestrians and bicyclists on the Livingston Avenue Bridge would be addressed as part of the Livingston Avenue Bridge Project. For more information on the Livingston Avenue Bridge, please visit the LAB project website: https://www.dot.ny.gov/display/projects/livingstonavebridge</p>
Commenter	Bullock, Doug, Committee Chair of Mass Transit, Albany County Legislator
Comment E-1-2	<p>The bridge is located in an area of the City of Albany suffering from extreme poverty and high unemployment. This project should be considered an environmental justice issue. What benefit will it provide for historically underserved populations of the county that will feel the greatest impact from its construction and operation? Albany County's support and the benefits of the Walkway must be acknowledged in each and every one of the alternative scenarios put forth in the Empire Corridor DEIS. Furthermore, the report should perform a Title VI and Environmental Justice Analysis of the each of the potential scenarios</p>
Response	<p>Your concerns, relating to environmental justice, are recognized and will be addressed in the Tier 2 assessments. The EA will include a more detailed analysis, including a Title VI/EJ analysis, that would be performed as part of required environmental documentation.</p>
Commenter	Bullock, Doug, Committee Chair of Mass Transit, Albany County Legislator
Comment E-1-3	<p>My name is Doug Bullock, I'm an Albany County Legislature, Chair of the Mass Transit Committee in Albany County and I support the Livingston Avenue Bridge with a ramp, which is really important for connectivity in Albany.</p> <p>The County is building a new rail-trail coming down from Bethlehem to South Pearl Street, eventually to connect up to the trail along the Hudson River, and that trail can be an extension of the Livingston Avenue Bridge and it's very important that you connect with the</p>

community. Not only that aspect, but the aspect of transportation to the rail station in Rensselaer will become a lot easier with a walkway slash bikeway on that bridge and we could have the possibility of alternative transportation directly to the train station, The Albany County Legislator signed a proclamation.

A majority of people on the legislature, a majority of legislatures said we want 28 out of the 39. We want a pedestrian walkway on that Livingston Avenue Bridge.

Response Thank you for your comment on the Livingston Avenue Bridge Project. Please refer to our response to your earlier comment (E-1-1).

Commenter **Bullock, Doug, Committee Chair of Mass Transit, Albany County Legislator**

Comment E-1-4 One thing I want to emphasize and I think it's absurd that you're calling it a high speed rail period.
It's a lot faster, but it's really important that we have a dedicated passenger rail. That is very important, and at the highest speed possible. Seventy-seven miles per hour is barely going to compete with an automobile speed.
So let's face it, we got to do better.

Response Your comment was considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. The purpose of the High Speed Rail Empire Corridor Program is to improve the reliability, frequency, trip times and passenger amenities for intercity rail passenger service between New York City and Niagara Falls. Alternative 90B will provide approximately 370 miles of additional trackage to better segregate passenger and freight traffic and will reduce travel times between New York City and Niagara Falls by 1 ½ hours in 2035, compared to the Base Alternative.

Commenter **Fahy, Patricia, Member of Assembly, 109th District, NYS Assembly**

Comment E-2-1 Walkway on the Livingston Avenue Railroad Bridge. This Walkway, though inaccessible for many years, is an invaluable resource enabling pedestrians and bicyclists to cross the Hudson River for both work and recreation. Restoration and repair of the Walkway will improve bicycling and pedestrian access without impeding rail traffic. The bridge itself has reached the end of its lifespan and the bridge is slated to be completely reconstructed in 2017 as part of New York State's High Speed Rail initiative. It is essential that reestablishment of the Walkway be part of the plan to replace the bridge.
Restoration of the Walkway will aid in the establishment of a multi-modal transportation network connecting urban centers across the Hudson River. This corresponds to the emphasis on creating "complete streets" and ensuring safe access for people using all modes of transportation, including pedestrians and bicyclists. The restored access is highlighted in several state and federally funded plans including the Albany 2030 Comprehensive Plan (2011), the Albany Bike Master Plan (2009), and the Patroon Creek Greenway Plan (2004). Restoration of the Walkway is a significant Title VI and environmental justice issue. Neighborhoods in the vicinity of the bridge are low income and have high unemployment with a high percentage of families living below the poverty level. These families are more likely than not to need the low or no cost pedestrian and bicycle access on a daily basis that the Walkway would provide. These same families would bear the brunt of any increased noise and emissions created by the High Speed Rail.
This investment in infrastructure to restore the Walkway has additional benefits that include increases in physical fitness activity, tourism, reduced traffic congestion and travel time, safer streets and cleaner environment. The City of Albany hopes to invest \$11 million in upgrades to the Corning Preserve waterfront park, including a new covered stage for events like Alive at Five, a restaurant, kayak launch, bike path improvements, cafe and boat docks. The Walkway is a natural extension to these and other recreational activities along the Hudson.

Reestablishment of the Walkway is an essential part of the New York State High Speed Rail initiative and has my full support.

Response Thank you for your comments regarding pedestrian access on the Livingston Avenue Bridge between Albany and Rensselaer. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. Including accommodations for pedestrians and bicyclists on the Livingston Avenue Bridge would be addressed as part of the Livingston Avenue Bridge Project. For more information on the Livingston Avenue Bridge, please visit the LAB project website:
<https://www.dot.ny.gov/display/projects/livingstonavebridge>

Commenter Magnarelli, William B., Member, 129th District, NYS Assembly

Comment E-3-1 I am writing to add my comment on the proposed High Speed Rail Empire Corridor Program. I wanted to add my support to this effort. I believe the expansion of high speed rail service in New York will provide needed economic development and better connect our Upstate communities to New York City. I would like it noted that I support the "Alternative 125" proposal that would provide service at a speed of up to 125 mph. I believe that high speed rail expansion is important to the future of New York State and especially Upstate New York. Traveling from Syracuse to New York City can be a very expensive and time consuming experience. According to the DOT's estimates, the "Alternative 125" plan could shorten the travel time by rail from Syracuse to NYC by approximately two hours. Shortening this travel time would make it easier for NYC residents to travel Upstate, especially those that don't own cars. I also believe it would further the Governor's goal of encouraging people from NYC to visit and enjoy our Upstate communities.

Response Thank you for your comments in support of the High Speed Rail Empire Corridor Program, and the 125 Alternative. Comments from elected officials were an important part of the selection process for the Preferred Alternative. In selecting Alternative 90B as the Preferred Alternative for the High Speed Rail Empire Corridor Program, the FRA and NYSDOT selected a program of improvements largely situated within the existing rights-of-way, thereby minimizing both costs and impacts. Alternative 90B would also shorten the trip from New York City to Niagara Falls by 1½ hours. Alternative 125 was dismissed, based on greater impacts (to 2,000 to 3,000 acres of land) and higher costs (more than double the costs for the Preferred Alternative). A substantial drawback of Alternative 125 is that it would take the longest time to construct and would be the costliest alternative.

Commenter Brindisi, Anthony, Member of Assembly, NYS Assembly

Comment E-4-1 I am writing to you in strong support of the development of a high-speed rail plan along the existing Empire Rail Corridor that would include regular service to and from the Utica and Rome train stations. In recent years, passenger rail ridership from the Utica and Rome train stations is up significantly. However, one of the major issues I hear about often is the reliability of service from the Mohawk Valley to other parts of the state. Currently, the on-time performance of passenger trains on the Empire Corridor is only about 83 percent. Developing high-speed rail service would boost service reliability to well over 90 percent. This would be in addition to the significant reduction in travel time from Utica to other locations on the corridor from high-speed service. Developing a reliable high speed rail system is especially important as the economy of the Mohawk Valley region continues to move forward. By year's end, construction is expected to be complete on the 'Quad C' building which will anchor the new NanoUtica project on the campus of SUNYIT near Utica. Within several years, 1,500 people will be working on

research and development projects at this new nanotechnology center. Rome will soon be the site for one of six federal facilities testing commercial drone flights. I am confident that rail ridership will increase significantly because of new projects in our region, if fast, reliable train service is available.

Separating passenger rail and freight rail lines would not only benefit travelers, but would also encourage more use of freight lines. Both would significantly reduce the use of fossil fuels and of highway congestion. Developing high-speed rail in New York will benefit businesses, encourage tourism, and help the environment. But I would like to emphasize that I will only support a high-speed rail alternative that includes regular passenger rail service from the Utica and Rome train stations.

Response Comments from elected officials were an important part of the selection by NYSDOT and the FRA of Alternative 90B as the Preferred Alternative. As noted in the Tier 1 FEIS, Alternative 90B would double the service frequency along Empire Corridor West for the service leg that includes Utica and Rome. Alternative 90B would result in the best on-time performance for Amtrak service in 2035 of all of the alternatives considered and would increase ridership by 1 million over the Base Alternative. .

Commenter Young, Gregory, Board of Supervisors, Fulton County

Comment E-5-1 Even though neither the current nor any of the proposed Amtrak services directly reach Fulton County, there is service in nearby Montgomery County via the Amsterdam Station. Passenger rail is an important connecting linking our area with the rest of the state. For this reason, I enthusiastically support the Base Alternative, Alternative 90A, Alternative 90B, and Alternative 110. However, I'm opposed to Alternative 125 because this plan would not only exclude the Amsterdam Station, but also the two next stations at Schenectady and Rome as well, meaning that the closest station for residents of this region would be over an hour away. Indeed, this would have the greatest impact on individuals who do not own automobiles, since they have the greatest need for high-speed rail, yet would lack access to it by virtue of being unable to get to a station.

Response Thank you for your comments in support of maintaining passenger rail service to Amsterdam, Schenectady and Rome. Under the Preferred Alternative, Alternative 90B, rail service would continue with more frequent and faster service to Schenectady, Amsterdam, Utica, and Rome. Alternative 125 has not been selected as the Preferred Alternative.

Commenter Young, Gregory, Board of Supervisors, Fulton County

Comment E-5-2 In terms of fiscal cost, I support Alternative 110 since it has the lowest subsidy per rider at only \$9.

Response Thank you for your comments in support of Alternative 110. NYSDOT and FRA have selected Alternative 90B as the Preferred Alternative. Although Alternative 110 has the lowest subsidy, the subsidy for the Preferred Alternative (Alternative 90B) would be \$13 per rider, which would be lower than both Alternative 125's subsidy per rider of \$14 and the Base Alternative's subsidy per rider of \$17 per rider. Alternative 90B's costs would also be less than that for Alternative 110. Its capital cost would be \$720 million (or 12%) less than that for Alternative 110, and annual operating and maintenance costs would be \$2 million lower than for Alternative 110.

Commenter Stammel, Michael and Breselor, Judith,, Legislator, District 6 and District 4, Rensselaer County Legislature

Comment E-6-1 We are in full support of the objectives of the high speed rail project and the improvements that the project will bring to our current rail system.

Response	Thank you for your comment on the High Speed Rail Empire Corridor Program. The goals of the program are to improve reliability, trip times, passenger amenities and frequency of service. Comments from elected officials and the public in support of the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.
Commenter	Stammel, Michael and Breselor, Judith,, Legislator, District 6 and District 4, Rensselaer County Legislature
Comment E-6-2	<p>We are advocating for the restoration of the walkway on the historic Livingston Avenue Bridge as a part of any project alternative considered by the New York State Department of Transportation (NYSDOT). A restored Livingston Avenue Bridge walkway would allow for pedestrian and cyclist traffic between Albany and Rensselaer, providing much safer transport than the Dunn Memorial Bridge located to the south. The walkway would further benefit residents, encourage tourism and enhance the local economies of surrounding areas. We believe that the success of the Walkway Over the Hudson, the transformation of the Poughkeepsie-Highland Railroad Bridge, can be emulated with the restoration of the Livingston Avenue Bridge. Furthermore, in 2011, Governor Cuomo signed the Complete Streets Act, which urges consideration of the convenience and mobility of all users when designing transportation projects. A restored Livingston Avenue Bridge would fall in line with the spirit and vision of the Complete Streets Act and further New York State's commitment to a sustainable future.</p> <p>Local support for the walkway has, and continues to be widespread. The Rensselaer County Legislature, The City of Rensselaer, Albany County, Albany Common Council, The Hudson River Greenway and the Greenway Conservancy have all passed resolutions in support of a restored walkway.</p> <p>We believe that if the walkway is not constructed during the current high speed rail project, then increased costs to add a walkway after the project completion would prove to be too expensive and perhaps render the project unworkable. We implore NYSDOT to consider the economic and environmental benefits that the walkway would afford the communities of Rensselaer and Albany as well as the groundswell of support for improved waterfront access and sustainable transportation.</p>
Response	<p>Thank you for your comments in support of the upgrade of the Livingston Avenue Bridge. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. Including accommodations for pedestrians and bicyclists on the Livingston Avenue Bridge would be addressed as part of the Livingston Avenue Bridge Project. For more information on the Livingston Avenue Bridge, please visit the LAB project website:</p> <p>https://www.dot.ny.gov/display/projects/livingstonavebridge</p>
Commenter	Stammel, Michael, Legislator, Rensselaer County Legislature
Comment E-7-1	<p>I am writing to convey my support for incorporating a restored pedestrian and bicycle walkway on the Livingston Avenue Bridge over the Hudson River between the cities of Rensselaer and Albany. A walkway was an important component for generations of this historic bridge, and a restored walkway will again ensure the Livingston Avenue Bridge is a vital part of the Capital Region.</p> <p>A new pedestrian and bicyclist walkway on the Livingston Avenue Bridge will strengthen connections between communities in the area and significantly boost tourism efforts, as well as expand recreational opportunities for residents. The walkway will also help showcase the Hudson River and access to this outstanding waterway.</p> <p>Recent media reports have noted the lack of pedestrian and bicycle access over the Hudson.</p>

The reopening of this walkway will help address that growing need.

Reopening the walkway will also position the Capital Region for the same kind of tourism success seen in the Mid-Hudson Valley with the Walkway Over the Hudson. The Walkway Over the Hudson reports thousands upon thousands of visitors each year.

The Rensselaer County Legislature joined with a number of other area municipalities in adopting a resolution supporting re-establishment of the walkway on the Livingston Avenue Bridge. Our resolution, which I sponsored, reflects the strong support and enthusiasm for reopening the walkway on the bridge.

Response As noted in the prior comment, the Livingston Avenue Bridge, although part of the High Speed Rail Empire Corridor Program, is being advanced as part of a separate project. The Tier 1 FEIS will note the support for the pedestrian walkway and bicycle path on the bridge.

Commenter Galvin, Patrick M., Senator (Mitch Martin), 59th District, NYS Senate

Comment E-8-1 If you do an alternative option, please include the replacement of the 4 Depew rail bridges and the widening of Transit Road to improve safety and the economy of the village of Depew and the surrounding area.

Response Thank you for your comment discussing the need to improve rail bridges in the Village of Depew. Consideration of bridge replacements will be part of future Tier 2 assessments and constructability analysis for the supporting projects for the Preferred Alternative.

Commenter Sheehan, Kathy, Mayor, City of Albany

Comment E-9-1 The City of Albany is committed to seeing the Bike and Pedestrian Walkway on the Livingston Avenue Bridge restored when this bridge is rebuilt or replaced as part of the Empire Corridor project. The benefits of restored access across the river via a walkway on the Livingston Avenue Bridge has been featured in several local and regional plans, including the City's comprehensive Plan, Albany 2030 (2012), the Albany Bicycle Master Plan (2009), and the Patroon Creek Greenway Plan (2004), and the City's Common Council has passed a resolution of support for the re-establishment of the walkway. The restoration of the walkway is also highlighted in the Corning Preserve Master Plan that the City is currently finalizing. Any new railway bridge that is constructed should reflect the City of Albany's and the Capital Region's commitment to provide excellent bicycle and pedestrian facilities in our urban areas. A multi-modal bridge will link a growing network of multi-use trails, including the Erie Canalway Trail, Albany County's Helderberg Hudson Rail Trail, and the proposed Rensselaer County Trail. Enhancing walking and biking transportation across the Hudson River will increase the efficiency and effectiveness of the transportation network and make the riverfront a more attractive and accessible place to visit.

Response Thank you for your comments in support of the upgrade of the Livingston Avenue Bridge. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. Including accommodations for pedestrians and bicyclists on the Livingston Avenue Bridge would be addressed as part of the Livingston Avenue Bridge Project. For more information on the Livingston Avenue Bridge, please visit the LAB project website:
<https://www.dot.ny.gov/display/projects/livingstonavebridge>

Commenter Sheehan, Kathy, Mayor, City of Albany

Comment E-9-2 For nearly half a century a walkway on the Livingston Avenue Bridge made it possible for pedestrians and bicyclists to easily and safely cross the Hudson River between Rensselaer and Albany. New York State's High Speed Rail investment, and replacement of this historic

crossing, will provide an opportunity to replace the walkway that provided a vital link between these communities. Please ensure that the Empire Corridor Tier 1 Draft Environmental Impact Statement fully acknowledges the planning and development of trails within the region that depend upon the Walkway.

Response Your comments on the Livingston Avenue Bridge have been considered, as noted in the prior response, and the Tier 1 FEIS will note the support for the pedestrian walkway and bicycle path on the bridge.

Commenter **Franczyk, David A., Councilman, The Buffalo Common Council**

Comment E-10-1 My constituents' concerns are that the remaining plans of the Tier 1 Empire Corridor project neglect Buffalo. My understanding is that this project is about connecting the state and improving our transportation. People in Buffalo want to connect with the rest of this state and people in this state want to come to Buffalo.

Response Thank you for your comment on the High Speed Rail Empire Corridor Program. The goals of the program are to improve reliability, trip times, passenger amenities and frequency of service. Comments from elected officials supporting the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative. Alternative 90B will better serve travelers destined to and from Buffalo and other points along Empire Corridor West by providing more frequent and faster service. Alternative 90B would double the number of trips on Empire Corridor West. It would also reduce travel times in 2035 by 1 ½ hours between Niagara Falls and New York City.

Commenter **Franczyk, David A., Councilman, The Buffalo Common Council**

Comment E-10-2 Now with plans coming together to spend federal funds on the Governor's goal to revitalize Upstate New York, it seems that EPAC has forgotten one of the region's most significant cities. It seems that EPAC has forgotten the New York Central Terminal (NYCT) in Buffalo, designed in 1929. Buffalo's NYCT would be the perfect site to include in your plans for both transportation and historical preservation goals. Yet when reviewing the Tier 1 options, I see that NYSDOT and the FRA are proposing new or rebuilt intermodal train stations in every city except Buffalo.

As your work continues, please consider developments in Buffalo. This city is a major hub of transportation and has a lot to offer the people of this state. Many will benefit from improvements made here.

Response Thank you for your comments on the High Speed Rail Empire Corridor Program and the use of the former Central Terminal in Buffalo, New York. Improvement to the passenger rail facilities in the City of Buffalo area is an important goal of the High Speed Rail Empire Corridor Program. NYSDOT has implemented upgrades at the existing rail station at Buffalo-Depew to improve/rehabilitate the parking lot and enhance passenger access to comply with Americans with Disabilities Act requirements. The High Speed Rail Empire Corridor Tier 1 EIS evaluates a range of improvements for the purpose of making decisions on corridor-level service. The focus was on utilizing existing stations along the Empire Corridor, including the stations at Buffalo-Depew and Buffalo-Exchange Street. Buffalo Central Terminal was not included in the analysis of the Build Alternatives. The building is on the north side of the main tracks at the west end of CSX Transportation's Frontier Yard and is not easily accessible for passenger trains. In the spring of 2017, the Governor and Mayor formed and participated in a Train Station Site Selection Committee, that also included elected, state, county, city officials, Amtrak, and other public and private transportation officials. The committee voted to approve a downtown station site closer to the existing Buffalo-Exchange Street Station over the Central Terminal location. Some of the primary reasons for the selection of the downtown site included economic benefits to the

downtown business district, as well as population densities that support the transit use. Construction of a new terminal at the Buffalo-Exchange Street Station site finished in November 2020.

Commenter	Franczyk, David A., Councilman, The Buffalo Common Council
Comment E-10-3	...the Common Council supports the amendment of the High Speed Rail Empire Corridor Program to include the revitalization of the New York Central Terminal on Memorial Drive as an Intermodal Train Station in the City of Buffalo and officially submits this resolution to NYSDOT by the March 24, 2014 deadline.
Response	Thank you for your comments on the High Speed Rail Empire Corridor Program and the use of the former Central Terminal in Buffalo, New York. As described above, the train station siting committee tasked with evaluating prospective locations for a Buffalo Amtrak/bus station, including Central Terminal, voted in favor of a downtown station location.
Commenter	Franczyk, David A., Councilman, The Buffalo Common Council
Comment E-10-4	The City of Buffalo derives very little economic benefit from the proposed High Speed Rail Corridor plan.
Response	Thank you for your comment on the High Speed Rail Empire Corridor Program. Comments from elected officials have been considered by FRA and NYSDOT in the selection of the Preferred Alternative. As described above, the Preferred Alternative and program of improvements for Buffalo include new station investments at both Buffalo-Depew and Buffalo-Exchange Street, which is anticipated to result in economic benefits for the downtown area.
Commenter	Franczyk, David A., Councilman, The Buffalo Common Council
Comment E-10-5	Tragically, the 1929 Felheimer and Wagner 1929 New York Central Terminal is totally and utterly ignored in this flawed plan. That magnificent structure, listed on the Registry of Historic Places, should be the Intermodal hub in Buffalo. This not only revives rail transportation in that facility, but accomplishes the state's historic preservation mission, while revitalizing a struggling East Side community. As Daniel Burnham opined: "Make no small plans"; the omission of the City of Buffalo, once the second largest rail center in the United States, needs to be treated with greater respect as well as a recognition of the vital role it can play in the admirable goal of bringing fast speed rail to the Empire State. Change the plans! Renovate the Central Terminal on Memorial Drive in East Buffalo.
Response	Thank you for your comments on the importance of the Central Terminal in Buffalo. Please refer to the response to Comment E-10-1 for information on the results of the train station siting study and committee vote.
Commenter	Rabb, Gregory P., President and Councilman-at-Large, City of Jamestown
Comment E-11-1	I am concerned that the 32,000 residents of my city in the western most county of New York State are not addressed in your plan.
Response	Thank you for your comment on the High Speed Rail Empire Corridor Program. These improvements are largely confined to the existing right-of-way with proposed service focused on existing station sites. The Preferred Alternative (Alternative 90B) will result in improvements in travel time, frequency, and reliability that should result in regional benefits to the traveling public. Suggestions and comments from elected officials, for

improvements to the service, have been considered in the development of the Service Development Plan.

Commenter **Rabb, Gregory P., President and Councilman-at-Large, City of Jamestown**

Comment E-11-2 AMTRAK does "pass through" our county, Chautauqua, with the Lakeshore Ltd. with no stops despite a station still existing in Dunkirk with easy access to SUNY Fredonia. For the Empire Corridor we can drive to Buffalo-Depew but increasingly there are not enough parking spaces, despite recent improvements, and Buffalo-Depew continues to be slow in loading and unloading passengers causing significant delays due to a lack of elevated platforms as in Syracuse. Our alternative is to use a bus connection to the Buffalo-Exchange Street Station (perhaps the worst station in the system) involving a two hour bus trip with a nearly three hour layover resulting in a five hour trip for 75 miles. My constituents need and deserve better service as do the students at SUNY Fredonia and so I strongly urge you to not forget us and to make better bus connections and Buffalo station improvements an important part of your Empire Corridor plans and your environmental impact statement.

Response Thank you for your comments on the High Speed Rail Empire Corridor Program and the need to improve service on the Empire Corridor and at Buffalo-Depew. Improvement to the passenger rail facilities in the City of Buffalo area is an important goal of the High Speed Rail Empire Corridor Program. NYSDOT has implemented upgrades at the existing rail station at Buffalo-Depew to improve/rehabilitate the parking lot and enhance passenger access to comply with Americans with Disabilities Act requirements. In the spring of 2017, the Governor and Mayor formed and participated in a Train Station Site Selection Committee, that also included elected, state, county, city officials, Amtrak, and other public and private transportation officials. The committee voted to approve a downtown station site close to the existing Buffalo-Exchange Street Station. Construction of a new terminal at the Buffalo-Exchange Street Station site finished in November 2020. Some of the primary reasons for the selection of the downtown site included economic benefits to the downtown business district, as well as population densities that support the transit use. The new station was designed to accommodate potential upgrades in intermodal connectivity in the future.

Commenter **Miner, Stephanie A., Mayor, City of Syracuse**

Comment E-12-1 I am writing to you in support of the development of high speed rail along the Empire Corridor across Upstate New York...

Response Your comments providing support for the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.

Commenter **Miner, Stephanie A., Mayor, City of Syracuse**

Comment E-12-2 Faster rail service through Syracuse has the power to be a major economic catalyst for our entire region and I encourage you to fully discuss all possible options...The City of Syracuse sits as the center of a unique region: we are within 8 hours—a day's drive—of tens of millions of people. New York, Washington, Toronto, Boston, Montreal are all close neighbors. Syracuse has distinctive potential for growth. According to a recent study on American cities by McKinsey and Company, "middleweight cities," those defined as being the anchors of metropolitan statistical areas (MSA) between 150,000 and 10,000,000, are home to 70% of the nation's population and produce 70% of the nation's gross domestic product. The Syracuse MSA is approximately 660,000. Syracuse is home to growing higher education, technology, and medical research industries. We have also seen our urban core undergo rapid expansion in recent years, with over three quarters of a billion dollars in new construction taking place in the City of Syracuse since 2010. This new development is a sign that the private sector understands what we have to offer and wants to see Syracuse realize

our potential. With the implementation of high speed rail as another agent of growth, we will be able to see continued economic expansion across our city and our region.

Response Thank you for your support for the High Speed Rail Empire Corridor Program. Comments from elected officials supporting the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative. The Preferred Alternative was selected to provide improvements in travel time, frequency, and reliability, which will provide regional travel and economic benefits to Syracuse and other metropolitan areas served.

Commenter **Crist, Craig M., Lawyer, Dreyer Boyajian LLP on Behalf of the Village of Castleton**

Comment E-13-1 As you may be aware, the Village is located on the Empire Corridor South, just south of the Rensselaer Station.
Mayor Keegan and Village Board are in favor of improved rail service, improvement which they believe will continue to spur economic improvement and growth in the region. However, the Village requests that the subject trains decrease their speed through the inhabited portion of the Village. It is the Village Board's belief that this will promote safety as well as protect the structures immediately adjacent to the existing tracks.

Response Thank you for your comment on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Your comments discussing the speed of trains in the Village of Castleton have been noted. Chapters 2 and 3 of the Tier 1 FEIS, address safety for the existing corridor and the program alternatives. Safety issues related to operation of the high speed trains for both grade crossings and along the right of way will be one of the factors considered in advancing the program in Tier 2.

Commenter **Crist, Craig M., Lawyer, Dreyer Boyajian LLP on Behalf of the Village of Castleton**

Comment E-13-2 The Village Board would be in favor of increased accessibility via the now closed Scott Avenue crossing to allow the Village and its residents increased access to the Village's park on the other side of the tracks. This has been the subject of ongoing discussions with NYS DOT.
Finally, continuing project updates are requested, and should be sent to the following address: Mayor Joseph Keegan and Members of the Village Board, 85 South Main Street, Castleton, NY 12033

Response Thank you for your comments regarding operation of passenger trains for the High Speed Rail Empire Corridor Program through the Village of Castleton. We will add the Village Mayor and Members of the Board to our mailing list to receive updates on progress with the program.

Commenter **Leonard, Edmond, Trustee, Village of Walden**

Comment E-14-1 Very impressed with the Tiers--Would hope funding will allow for one of the higher tiers...would hope the project doesn't get bogged down with the approval process

Response Your comment providing support for the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.

Commenter **Doesschate, Judy, Councilwoman, 9th Ward, Albany City Council**

Comment E-15-1 I am a recently-elected member of the Albany City Council, representing the 9th Ward. So no surprise I am here also to support the idea of returning a pedestrian and bike trail to the Livingston Street Bridge.

Response	<p>Thank you for your comments in support of the upgrade of the Livingston Avenue Bridge. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. The Livingston Avenue Bridge Project has independent utility due to its physical condition. For more information on the Livingston Avenue Bridge, please visit the LAB project website:</p> <p>https://www.dot.ny.gov/display/projects/livingstonavebridge</p>
Commenter	Doesschate, Judy, Councilwoman, 9th Ward, Albany City Council
Comment E-15-2	<p>I'm not sure that I can fully support the 125 alternative, because I haven't been able to look at the issues and of course we want to make sure that it's also safe, and there is a lot of intersections that these train rails might go by that I would have concerns about ...</p> <p>But certainly to remain competitive, we need to connect upstate better with New York City and interconnect our communities more so that they remain competitive, economically competitive...</p>
Response	Your comment in support of the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.
Commenter	Dyster, Paul A., Mayor, City of Niagara Falls
Comment E-16-1	<p>My name is Paul A. Dyster. I am the mayor of the City of Niagara Falls, New York.</p> <p>We need to work hard for our ability to get projects cleared environmentally, get more projects into the queue in order to speed this process up.</p>
Response	Your comments in support of the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.
Commenter	Dyster, Paul A., Mayor, City of Niagara Falls
Comment E-16-2	<p>Second, I want to make a point that more better and faster train service can be managed throughout New York State. Economic growth of New York State has integrated mobility, better planning, higher speed trains so things plus best of all transportation goals in our area. Trains require less land than major airports which means less pollution traveling per passenger.</p> <p>The City of Niagara Falls was ahead of curve. We started over ten years ago with the idea to build a modern station. With the last five years, we have seen our ridership at the Niagara Falls Station increase 30 percent and that's without all the improvements we're contemplating now.</p> <p>We will open the station in 2016.</p>
Response	Thank you for your support for the High Speed Rail Empire Corridor Program and the new Niagara Falls International Railway Station and Intermodal Transportation Center, which opened in December 2016. Comments from elected officials in support of the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.
Commenter	Dyster, Paul A., Mayor, City of Niagara Falls
Comment E-16-3	<p>Option 125 would clearly be our favorite with the idea of a six-hour travel time between Niagara Falls and New York City which has obvious appeal. Recognizing that time and money do make a difference, we would basically state our intention to support the highest speed objectives that can be delivered in the shortest period of time/cost that is politically</p>

affordable.

I think our hope is that at least we're able to achieve Option 110.

Response Thank you for your comments on the High Speed Rail Empire Corridor Program, and your support of Alternative 125, or 110, has been considered by NYSDOT and the FRA in the selection of the Preferred Alternative. Alternative 90B, the Preferred Alternative, would result in the best on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered (see Exhibit 6-8 in the Tier 1 FEIS). Moreover, Alternative 90B would incur lower costs and fewer environmental impacts than Alternatives 110 and 125. Alternative 90B would have land use impacts in nine areas in six counties, compared to 53 areas in eight counties with Alternative 110. Alternative 125 would impact 2,000 to 3,000 acres for construction of a new right-of-way.

Commenter **Donovan, Dick, Mayor, Village of Minoa**

Comment E-17-1 My village has a distinct, well, pleasure, what have you, of hosting the one section of what's known I think by most of you people as the Dewitt Yard. Thousands of cars go through that yard daily.
Having lived in the Village for 42 years, I've been involved in the fire department, we've had a lot of excitement in that yard. The main switches going eastbound are right in the heart of our village, which, by the way, the yard splits our village right in half, so we've got residents who are primarily of another community and we got homes on both sides of the track, unfortunately. So, as you go forward, I want to ask that consideration -- safety considerations be thought about as far as the speed especially of these units going through populated areas, and I know a lot of improvements have been made over the years and it's less of a concern than it used to be

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. In the Tier 1 FEIS, Chapters 2 and 3 address safety for the existing corridor and the program alternatives. Safety issues related to the operation of the high speed trains and interaction with adjoining rail facilities, such as Dewitt Yard, will be one of the factors considered in advancing the program in Tier 2.

Commenter **Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives**

Comment E-18-1 Now, I'm going to be really brief because you know how I feel. I'm going for 125. We've waited well over a hundred years to try to get something done here and I don't want to start small.

Response Thank you Congresswoman Slaughter for your comments in support of the High Speed Rail Empire Corridor Program. Your support for the 125 Alternative has been considered by the FRA and NYSDOT in the selection of the Preferred Alternative. Alternative 90B, the Preferred Alternative, would result in the best on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Moreover, Alternative 90B would have fewer environmental impacts than Alternative 125 and would also be less costly. Alternative 125 was dismissed, based on greater impacts to 2,000 to 3,000 acres and higher costs (more than double the costs for the Preferred Alternative). One of the drawbacks of Alternative 125 is that express service would not be directly provided to Niagara Falls, Rome, Utica, Amsterdam, and Schenectady. Alternative 125 would also take the longest time to incur travel benefits due to the time required to acquire and construct the right-of-way.

Commenter **Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives**

Comment E-18-2	In 1893, about a hundred and twenty-five years ago, the Empire State Express, Old 999, reached speeds of a hundred twelve miles an hour traveling between Batavia and Crittenden. Did you know that? We use the same track today by the way. Right now our fastest train goes thirty-three miles an hour, slower at its best speed, which we don't always see, and passengers know that it frequently travels a lot slower between here and New York City.
Response	Thank you for your comments on the historic railroad operation along the Empire Corridor. The intent of the Preferred Alternative (Alternative 90B) is to add trackage (approximately 370 miles in total), including along this two-track Empire Corridor West that formerly operated as a four-track line.
Commenter	Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives
Comment E-18-3	Now, don't tell me that we are not going to be able to make some investments in ourselves. The fact is that a hundred forty-six thousand people rode that train through this station and through this city last year, which was thirty percent higher than the year before. And you saw projections. And I've heard from people for years, frankly, of people who really want to ride that train, who really need to go somewhere.
Response	In your comment you addressed the importance of Rochester on the Empire Corridor. A key goal of the High Speed Rail Empire Corridor Program will be to improve trip times and provide additional trains to the communities along the Empire Corridor in Western New York. A new Rochester Station opened October 6, 2017, with significant help from you. The importance of Rochester as a travel destination, with many schools and high-tech firms is recognized, and ridership forecasts show that an improved service will attract new riders.
Commenter	Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives
Comment E-18-4	It is high time, as one of the most important parts of the transportation in the United States of America, that we spend some money to upgrade rail, that we do something about passenger service. We have people who can't drive anymore, who want to go visit their grandchildren, want to go to graduations, maybe want to go to New York City for a play and come back the next day.
Response	In your comments you outline the importance of intercity rail passenger service in our communities. The Preferred Alternative will better serve travelers destined to and from Rochester and other points along Empire Corridor West by providing more frequent and faster service. Alternative 90B would double the number of trips on Empire Corridor West.
Commenter	Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives
Comment E-18-5	Now, in addition to what we're doing here all these years I've been working on this I've been working with the Canadians. They've been ready with the money from word go. They would like to go up from Albany up to Montreal over to Toronto, back down into Buffalo. We can't go east or west out of Rochester. And the second, third and fourth largest cities in the State of New York, the Empire State, cannot fly to its State Capitol.
Response	Your comment highlights the opportunities for connections to Canada (Montreal and Toronto), along with other cities along the Empire Corridor. The Preferred Alternative will improve service to communities along the route, providing improved connectivity to the largest cities in the state and to points beyond. Recommendations from elected officials and public for initiatives to improve service will be considered in the development of the Service

Development Plan.

Commenter **Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives**

Comment
E-18-6 What I would like is -- and, you know, New York Central had four tracks. It is ideal. It's a straight shoot across there. We have no great problems that we have to do with geography. We have all the overpasses, the bridges and everything to accommodate four tracks. Only two are now being used. We need the dedicated third track for passengers. And the idea is that people who live in Buffalo can work in Rochester and vice versa. You can go to school back and forth. And, most important, you might go to New York City and spend about all the time you can stand down there and then make it back home and go to bed in your own bed at night. I love that idea.

Response Thank you for your comment in support of the High Speed Rail Empire Corridor Program, and its goals to improve passenger service and amenities and frequency of service along the route and connect the cities of New York State. The Tier 1 FEIS reviews the operation of multiple tracks for the alternatives considered for the High Speed Rail Empire Corridor Program with the purpose of identifying the necessary infrastructure projects to improve travel times and the reliability of service along the Empire Corridor. The Preferred Alternative, Alternative 90B, will add approximately 370 miles of trackage to better segregate passenger trains from freight.

Commenter **Slaughter, Louise, Congresswoman, 25th District, U.S. House of Representatives**

Comment
E-18-7 But there was one thing I wanted to say about the college kids and how important they are. You know, this is a treatment center for people who are hard of hearing. We have NTID, which is one of the best schools in the country here for the deaf. We met with students from universities and the colleges and from NTID. And a young woman told me something that I want you to remember what it's like to travel the railroad station in Rochester. She said that when she's in most stations the signage is so poor that what she does is when a huge crowd of people get up to go somewhere, she goes with them, hoping to goodness that they're going where she needs to be. Now, all that signage is going to be taken care of. We are paying attention to that. It's going to be wired for the internet from one end of it to the other. Everything in the world you want is in there. Tracks on both sides. Tracks that are level to the train. We're coming up into the 21st Century.

Response The New York State Department of Transportation, in partnership with Amtrak, CSX Transportation, the Federal Railroad Administration and the City of Rochester, and with significant help and support from you, constructed a new passenger rail station for the Rochester community. The new facility is fully compatible with the requirements of the Americans With Disabilities Act, offering facilities and signage to provide all passengers access to the station and boarding. A key feature of the new station is the high-level platform, which allows passengers to board and exit the trains without the need to use steps. The new high level platform on the dedicated passenger train tracks also improves the reliability of trains stopping at Rochester by allowing two trains to use the station simultaneously. The new facility at Rochester features state-of-the-art technology and wayfinding to facilitate passenger and baggage flow, as one of the newest stations in the Amtrak system.

Commenter	Striffler, Scot, Bridge Program Manager, Ninth District, U.S. Coast Guard
Comment F-1-1	Please include detailed potential impacts to vessel traffic, and navigation in general, in the descriptions of each alternative during the remainder of the EIS study.
Response	Impacts to navigation or vessel traffic are not anticipated with the possible exception of construction activity. Once the design for the Preferred Alternative is developed in Tier 2, the details of impacts on navigation during construction would be addressed.
Commenter	Striffler, Scot, Bridge Program Manager, Ninth District, U.S. Coast Guard
Comment F-1-2	Ninth Coast Guard District jurisdiction would only appear to apply to the "Empire Corridor West" and "Niagara Branch" sections of the DEIS and project area. Pending additional details as the study progresses this office may exercise jurisdiction or have permit requirements for each alternative still under consideration that includes upgrades or modifications to existing infrastructure, as well as proposed additional infrastructure, for any crossing of the New York Barge Canal System west of St. Johnsville, New York in Montgomery County, New York (mile 69.7). Though not considered a complete or final list, other waterways described in the DEIS that may fall within the jurisdiction of this office include; Cayuga-Seneca Canal Oswego Canal Mohawk River Genessee River Scajaquada Creek Niagara River Buffalo River Black Rock Canal (Buffalo, NY) Tonawanda Creek
Response	Thank you for your comment. If crossings of these other navigable waterways are proposed, coordination will be conducted with the USCG. A number of these navigable waterways were identified within the Tier 1 EIS, but if they were not located within the 300-foot study area, they were not specifically identified.
Commenter	O'Brien, Doug, Acting Under Secretary, U.S. Department of Agriculture, Rural Development, Office of the Under Secretary
Comment F-2-1	We appreciate the opportunity to review this Draft EIS. At this time the Department offers no comment.
Response	The response of the Department of Agriculture, Rural Development relating to the High Speed Rail Empire Corridor Program is recognized
Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-1	We offer the following comments in regards to protected species listed under the Endangered Species Act (ESA) of 1973, as amended, as well as other species and habitats protected under the Magnuson-Stevens Fishery Conservation and Management Act (MSA) and Fish and Wildlife Coordination Act (FWCA) under our jurisdiction.
Response	The comments offered by the Department of Commerce, National Oceanic and Atmospheric Administration, National Marine Fisheries Service, Northeast Region will be addressed in

the Tier 1 FEIS and Tier 2 analysis, as noted in the specific comments that follow.

Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-2	All of the alternatives discussed in the DEIS except the Base (i.e., No Action) Alternative include railroad crossings over the Hudson River. Specifically, Alternatives 90A, 90B, 110, and 125 include in-water work in order to replace the Livingston Avenue Bridge connecting Albany and Rensselaer, New York. Therefore, below we present information on ESA-listed species in the Hudson River. In addition, we recommend several mitigation measures to be undertaken during in-water construction activities to minimize impacts to listed species and their habitat. Finally, we provide guidelines for engaging with us in consultation under section 7 of the ESA.
Response	The Livingston Avenue Bridge Project () and associated EA is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. The Livingston Avenue Bridge Project has independent utility due to its physical condition. Under that environmental review, FRA and NYSDOT are coordinating with NMFS regarding Section 7 of the ESA.
Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-3	<p>Shortnose Sturgeon (<i>Acipenser brevirostrum</i>)</p> <p>A population of the federally endangered shortnose sturgeon occurs in the Hudson River. They have been documented from upper Staten Island (approximately river kilometer [rkm] 4.8) to the Troy Dam (approximately rkm 245). From late fall to early spring, adult shortnose sturgeon concentrate in a few overwintering areas. The largest overwintering area is just south of Kingston, New York, near Esopus Meadows (rkm 139-152) (Dovel et al. 1992). The fish overwintering at Esopus Meadows are mainly spawning adults. Captures of shortnose sturgeon during the fall and winter from Saugerties to Hyde Park (greater Kingston reach) indicate that additional smaller overwintering areas may be present (Geoghegan et al. 1992). Both Dovel et al. (1992) and Geoghegan et al. (1992) also confirmed an overwintering site in the Croton/Haverstraw Bay area (rkm 54-61). Fish overwintering in areas below Esopus Meadows are mainly thought to be pre-spawning adults. Typically, movements during overwintering periods are localized and fairly sedentary.</p> <p>When water temperatures reach 8-9°C, typically in late March through mid-April, reproductively active adults begin their migration upstream to the spawning grounds that extend from below the Federal Dam at Troy to about Coeymans, New York (rkm 245-212) (Dovel et al. 1992). Spawning typically occurs at water temperatures between 10-18°C (generally from late April through May) after which adults disperse quickly down river into their summer range. In fact, Dovel et al. (1992) reported that spawning fish tagged at Troy were recaptured in Haverstraw Bay in early June. The broad summer range occupied by adult shortnose sturgeon extends from approximately rkm 38-177. Similar to non-spawning adults, most juveniles occupy the broad region of Haverstraw Bay (rkm 54-61) by late fall and early winter (Dovel et al. 1992; Geoghegan et al. 1992). Juveniles are distributed throughout the mid-river region during the summer (rkm 38-152) and move back into the Haverstraw Bay region during the late fall (Geoghegan et al. 1992; Bain et al. 1998). Eggs and larvae are expected to be present within the vicinity of the spawning grounds for approximately four weeks post spawning (i.e., at the latest, through mid-June).</p>
Response	Section 4.13.3 of the Tier 1 EIS identifies the presence of federally endangered shortnose sturgeon and habitat within the study area. The comments offered by the Department of Commerce, National Oceanic and Atmospheric Administration, National Marine Fisheries

Service, Northeast Region will be addressed in the Tier 1 FEIS and Tier 2 analysis.

Commenter **Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region**

Comment
F-3-4

Atlantic Sturgeon (*Acipenser oxyrinchus oxyrinchus*)

Use of the Hudson River by Atlantic sturgeon has been described by several authors. Briefly, spawning likely occurs in multiple sites within the river from approximately rkm 56-182 (Dovel and Berggren 1983; Van Eenennaam et al. 1996; Kahnle et al. 1998; Bain et al. 2000). Selection of sites in a given year may be influenced by the position of the salt wedge (Dovel and Berggren 1983; Van Eenennaam et al. 1996; Kahnle et al. 1998). The area around Hyde Park (approximately rkm 134) has consistently been identified as a spawning area through scientific studies and historical records of the Hudson River sturgeon fishery (Dovel and Berggren 1983; Van Eenennaam et al. 1996; Kahnle et al. 1998; Bain et al. 2000). Habitat conditions at the Hyde Park site are described as freshwater year round with bedrock, silt and clay substrates and waters depths of 12-24 meters (Bain et al. 2000). Bain et al. (2000) also identified a spawning site at rkm 112 based on tracking data. The rkm 112 site, located to one side of the river, has clay, silt and sand substrates, and is approximately 21-27 meters deep (Bain et al. 2000).

Young-of-year (YOY) have been recorded in the Hudson River between rkm 60 and rkm 148, which includes some brackish waters; however, larvae must remain upstream of the salt wedge because of their low salinity tolerance (Dovel and Berggren 1983; Kahnle et al. 1998; Bain et al. 2000). Catches of immature sturgeon (age-1 and older) suggest that juveniles utilize the estuary from the Tappan Zee Bridge through Kingston (rkm 43-148) (Dovel and Berggren 1983; Bain et al. 2000). Seasonal movements are apparent with juveniles occupying waters from rkm 60-107 during summer months and then moving downstream as water temperatures decline in the fall, primarily occupying waters from rkm 19-74 (Dovel and Berggren 1983; Bain et al. 2000). Based on river-bottom sediment maps (Coch and Bokuniewicz 1986) most juvenile sturgeon habitats in the Hudson River have clay, sand, and silt substrates (Bain et al. 2000). Newburgh and Haverstraw Bays in the Hudson River are areas of known juvenile sturgeon concentrations (Sweka et al. 2007). Sampling in spring and fall revealed that highest catches of juvenile Atlantic sturgeon occurred during spring in soft-deep areas of Haverstraw Bay even though this habitat type comprised only 25% of the available habitat in the Bay (Sweka et al. 2007). Overall, 90% of the total 562 individual juvenile Atlantic sturgeon captured during the course of this study (14 were captured more than once) came from Haverstraw Bay (Sweka et al. 2007). At around three years of age, Hudson River juveniles exceeding 70 centimeters total length begin to migrate to marine waters (Bain et al. 2000).

Atlantic sturgeon adults are likely to migrate through the action area in the spring as they move from oceanic overwintering sites to upstream spawning sites and then migrate back through the area as they move to lower reaches of the estuary or oceanic areas in the late spring and early summer. Atlantic sturgeon adults are most likely to occur in the action area from May through September. Tracking data from tagged juvenile Atlantic sturgeon indicates that during the spring and summer individuals are most likely to occur within rkm 60-170. During the winter months, juvenile Atlantic sturgeon are most likely to occur from rkm 19-74. This seasonal change in distribution may be associated with seasonal movements of the salt wedge and differential seasonal use of habitats.

Please note, as the New York Bight distinct population segment (DPS) of Atlantic sturgeon is the only DPS of Atlantic sturgeon that spawns in the Hudson River, the information provided above only applies to this DPS. However, other DPSs of Atlantic sturgeon (e.g., Gulf of Maine, Chesapeake Bay, Carolina, and South Atlantic) are known to be present within the Hudson River, approximately up to the 0.5 parts per thousand salinity threshold in the River. As such, subadult and adult Atlantic sturgeon from any DPS may be present within the Hudson River.

Response	Section 4.13.3 of the Tier 1 DEIS/FEIS identifies the presence of federally endangered Atlantic sturgeon and habitat within the study area. The comments offered by the Department of Commerce, National Oceanic and Atmospheric Administration, National Marine Fisheries Service, Northeast Region will be addressed in the Tier 1 FEIS and Tier 2 analysis.
Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-5	<p>Mitigation Measures</p> <p>All but one of the proposed alternatives in the DEIS call for the replacement of the Livingston Avenue Bridge, which spans the Hudson River and connects the cities of Albany and Rensselaer. This bridge is located within the reach of the Hudson River used by shortnose sturgeon as a spawning ground. To avoid impacts to spawning adults or early life-stages, no in-water work should be undertaken from March 1 - June 30 of any calendar year. Outside of these time frames, shortnose sturgeon are not likely to occur in the vicinity of the bridge site. If the above time frame cannot be avoided, we recommend the following measures to minimize shortnose sturgeon exposure to injurious or disturbing levels of underwater noise during pile driving activities:</p> <ul style="list-style-type: none"> • Use of a soft start; and • Use of a vibratory hammer. This method of pile installation is non-impulsive and is believed to result in underwater noise levels approximately 10 decibels (dB) less than those levels of underwater noise produced during impact pile driving operations (Illingworth and Rodkin, Inc. and Jones and Stokes 2009). If feasible, we would also recommend the use of dewatered casings or enclosed bubble curtains around each pile to be driven to assist in further attenuation of underwater noise levels. Depending on pile size, these attenuation devices can provide between a 5-20 dB reduction in underwater noise levels (Illingworth and Rodkin, Inc. and Jones and Stokes 2009); or • Use of an impact hammer in conjunction with a wooden cushion block. The use of a wooden cushion block provides approximately 11-26 dB reduction in underwater noise levels produced during pile installation activities (Illingworth and Rodkin, Inc. and Jones and Stokes 2009). If feasible, we would also recommend the use of dewatered casings or enclosed bubble curtains around each pile to be driven to assist in further attenuation of underwater noise levels. Depending on pile size, these attenuation devices can provide between a 5-20 dB reduction in underwater noise levels (Illingworth and Rodkin, Inc. and Jones and Stokes 2009). <p>As shortnose sturgeon are also extremely sensitive to the exposure of elevated levels of noise and pressure levels produced by blasting, we strongly recommend the implementation of the following best management practices during all blasting operations which may occur during demolition of the existing bridge:</p> <ul style="list-style-type: none"> • Stemming of each detonation bore hole; • Delayed detonations; • Detonating charges with weights that will result in noise/pressure levels that are less than the injury/mortality and behavioral thresholds described above. If the latter cannot be done, blasting operations must be conducted in such a manner that the production of injury/mortality thresholds remains within close proximity to the source (i.e., within 100 feet); • Placement of a weighted turbidity curtain around the areas to be blasted. If injury/mortality thresholds are expected to be produced, we strongly recommend that the turbidity curtain be placed from the source to the distance where injury thresholds will be attained (i.e., at 100 feet). This will act as barrier, preventing any listed species from entering that area from the source where exposure to injurious levels of noise or pressure is likely; and • Development of a blast plan. In advance of any detonation activities, we would require that the applicant provide us with the blast plan for our review.

Response	Section 4.13.5 of the Tier 1 FEIS generally addresses mitigation measures. NYSDOT understands the time-of-year restrictions and the additional mitigation measures recommended by the National Marine Fisheries Service, which have been incorporated into the Tier 1 FEIS as appropriate. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for the Tier 1 assessment, but is being designed and implemented as a separate project. The Livingston Avenue Bridge Project has independent utility due to its physical condition. Under that environmental review, FRA and NYSDOT are coordinating with NMFS regarding Section 7 of the ESA.
Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-6	If the proposed project has the potential to affect ESA-listed species, and it is being approved, permitted, or funded by a Federal agency, the lead Federal agency (or their designated non-Federal representative) is responsible for determining whether the proposed action is likely to affect the listed species. The Federal agency would submit their determination, along with justification for their determination and a request for concurrence, to the attention of the ESA Section 7 Coordinator, NMFS Greater Atlantic Regional Fisheries Office, Protected Resources Division, 55 Great Republic Drive, Gloucester, MA 01930. After reviewing this information, we would then be able to conduct a consultation under section 7 of the ESA. Therefore, once an alternative is selected, we encourage you to contact us regarding the need for consultation
Response	NMFS will be consulted regarding the need for a Section 7 Evaluation, if appropriate during Tier 2 analysis. As discussed above, the Livingston Avenue Bridge replacement is advancing as a separate component project with independent utility. If required, a Section 7 Evaluation will be undertaken as part of a federally funded, permitted, or approved project that may affect ESA-listed species.
Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-7	If the project may result in substantial adverse impacts to EFH, an expanded EFH consultation would be necessary [§600.920(i)]. In preparing an expanded EFH consultation, we encourage you to include additional information in the EFH assessment such as results of onsite inspections, views of recognized experts, a review of pertinent literature, an analysis of alternatives and any other relevant information [50 C.F.R. §600.920(e)(4)]. Finally, depending on the degree and type of habitat impact, compensatory mitigation may be necessary to offset permanent and temporary effects of the project.
Response	NMFS will be consulted, as appropriate, regarding the need for an EFH (Essential Fish Habitat) Assessment. If needed, an EFH Assessment will be performed. Mitigation measures will be proposed as necessary to offset temporary or permanent adverse impacts.
Commenter	Colligan, Mary A., Assistant Regional Administrator for Protected Resources, National Marine Fisheries Service, Northeast Region
Comment F-3-8	While many of the impacts that would accrue to federally managed fishery resources under the MSA also would accrue to FWCA species, it is important to note that the interests of some species would not be represented adequately by relying on the EFH assessment alone. For instance, shellfish do not have an appropriate surrogate among the federally managed fishery resources that have EFH designated in the project vicinity and their needs and those of other nonrepresented species should be discussed at length in this section. Similarly, the

behaviors and habitat needs of diadromous and estuary-dependent fishes may not be represented by a discussion surrounding marine fishes. The discussion for FWCA species should be designed around an ecological guild model that uses locally important species to evaluate the project impacts to organisms or populations associated with the various trophic levels and life history strategies exhibited by FWCA species known to occupy the project site as residents or transients. Focus should be on issues surrounding particular species, life history stages, or habitat components that would be most susceptible to the various potential impacts.

Response The detailed species evaluations referenced in the comment would be addressed, as appropriate, during any detailed species-specific evaluations that may be performed for the EFH species. Without more details on both the nature and locations of program impacts on waterways, which are not available at the Tier 1 level, such an evaluation is not proposed to be included in the Tier 1 FEIS.

Commenter McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District

Comment F-4-1 As noted above, Department of the Army permits may be required from both the New York and Buffalo Districts of the U.S. Army Corps of Engineers to implement projects under the High Speed Rail Empire Corridor Program. Your primary contact for projects within the New York District's regulatory area of responsibility is Christine Delorier who may be reached at christine.delorier@usace.army.mil or (518) 266-6354. Your primary contact for projects within the Buffalo District's regulatory area of responsibility is Bridget Brown who may be reached at bridget.brown@usace.army.mil or (315) 255-0143. The following website contains a map of New York State that identifies the boundaries of the regulatory area of responsibility for both districts:
<http://www.lrb.usace.army.mil/Missions/Regulatory.aspx>
 For projects that span both districts, please be sure to contact both Corps points of contact.

Response The permits that may be required are identified in the resource sections of the Tier 1 FEIS and will be confirmed and obtained during Tier 2 when impacts can be determined based on final design.

Commenter McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District

Comment F-4-2 According to the Tier 1 DEIS, the Base Alternative consists of eight planned rail improvement projects that have already received NEPA Categorical Exclusions from the Federal Railroad Administration.
 We have no records of issuing any Department of the Army permits for these projects, and they may be required for work at some of these sites. The "Albany Schenectady Double Track Project", for example, proposes earthwork and grading, 19 bridge rehabilitations, 22 culvert repairs, new interlockings, a new signal system between Rensselaer and Schenectady, new 4 quadrant grates at three grade crossings in Colonie, and gated access roads along the right-of-way, all to be done by a contractor, and then the installation of 17 miles of double track by Amtrak forces, and likely requires a Department of the Army permit. We recommend that the proponents of these projects contact us to determine whether permits are required for the eight projects. If permits are required, completed permit applications should be submitted to the appropriate Corps District with sufficient time to allow the appropriate review and processing of the application, and prior to the commencement of project construction to avoid potential violations of Section 404 of the Clean Water Act and/or Section 10 of the Rivers and Harbors Act.

Response Correspondence, dated May 19, 2014 from NYSDOT to the USACE, addressed the permitting

status of the eight planned rail improvements that comprise the Base Alternative. In this correspondence, NYSDOT indicated that in undertaking projects such as these, efforts are made to avoid and minimize the impacts to waters of the United States. In cases where the impacts are unavoidable, the activities are typically authorized under the Section 404 Nationwide Permit (NWP) program. All of the projects contained in the Base Alternative have been screened and delineated for wetlands as part of each individual project's NEPA process. Two of the projects in the Base Alternative involved impacts to waters of the United States that are authorized by the NWP program, the Albany Schenectady Double Track Project, which was combined with the Albany-Rensselaer Station Fourth Track Capacity Improvements project and the Hudson Line Signal Wire Relocation project, which was combined with the Highway-Rail Grade Crossings Safety Improvements project. These projects within the Base Alternative have been completed. The Syracuse Track Configuration and Signals Improvement project (Phase 1) has also been completed, and no wetland impacts were anticipated to occur. The remaining three projects, Schenectady Station, Rochester Station, and Niagara Falls Station have also been completed in urbanized areas and also (as documented in Categorical Exclusion filings) were not anticipated to involve any impacts to waters of the United States requiring permit assessments. The minor impacts to waters of the United States associated with the Albany Schenectady Double Track Project were authorized by NWP #14 – Linear Transportation Projects. The minor impacts to waters of the United States associated with the Hudson Line Signal Project were authorized by NWP #3- Maintenance for minor impacts to waters of the United States. Both of these projects have been completed and complied with the NWP General Conditions and the permit-specific Regional Conditions.

Commenter **McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District**

Comment F-4-3 Section 4.6 of the Tier 1 DEIS identifies and discusses potential effects to surface waterbodies and watercourses, and Appendix G includes information on existing watercourses that have been identified within the project study area. The Regulatory Context section fails to discuss Sections 404 and 401 of the Clean Water Act and Section 10 of the Rivers and Harbors Act as also being applicable to the overall program implementation. Section 4.6 and Appendix G also focus on whether the identified waterbodies and watercourses are protected by the New York State Department of Environmental Conservation (NYSDEC), without acknowledging that all of these waterways, whether protected by the NYSDEC or not, are likely waters of the United States and subject to jurisdiction by the U.S. Army Corps of Engineers. We are also concerned that given the methods utilized to identify watercourses, many smaller streams that may be waters of the United States have yet to be identified. As with the future analysis of wetlands within the study area, we hope that future analysis of waterbodies and watercourses includes the field identification and delineation of these waters. Last, after all efforts to avoid and minimize impacts to these waters have been achieved through any re-designs and proposal of best management practices, we wanted to advise you that mitigation through the restoration, enhancement and/or preservation of water bodies and watercourses may be required by the U.S. Army Corps of Engineers to compensate for the resulting proposed lost functions and services of these aquatic resources.

Response The "Regulatory Section" of Section 4.10, Wetlands includes discussion of Sections 10, 401, and 404. The "Future Analysis" section, Section 4.6.6 of the Tier 1 FEIS, discusses filing of a joint permit application under Section 10/Section 401/Section 404, as appropriate. This section acknowledges that these waterways are protected and subject to jurisdiction under these regulatory programs. The detailed field identifications of waterways and wetlands would occur during Tier 2 analysis, as appropriate, and impact analysis would be performed using more detailed design, but the information has not yet been developed in Tier 1 to determine which of these waterways will be affected. Future analysis in Tier 2 would also

include efforts to avoid and minimize impacts on affected waterways and development of appropriate mitigation measures, through restoration, enhancement, and/or preservation of waterbodies.

Commenter McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District

Comment F-4-4 All of the navigable waterways within the study area that are subject to Section 10 of the Rivers and Harbors Act have not been identified at this point. Potential additional navigable waters within the study area include the Papsanee Creek, Schodack Creek and Stockport Creek; among others. We anticipate your coordination with us to help identify all waters subject to Section 10 of the Rivers and Harbors Act as the program progresses.

Response The information provided by or available from the U.S. Coast Guard and the U.S. Army Corps of Engineers regarding navigable waterways provided the basis for navigability determinations in the Tier 1 EIS. These are all tributaries to the Hudson River, which is identified as navigable in the Tier 1 EIS. The proposed work where the Empire Corridor either adjoins or crosses these Hudson River tributaries in Rensselaer and Columbia counties is anticipated to be constrained to the right-of-way and is not anticipated to involve impacts to navigable waterways. As previously discussed, the Tier 1 inventory of waterways will be refined in Tier 2 analysis, when project plans are developed in more detail. Coordination will be performed with the U.S. Coast Guard and the U.S. Army Corps of Engineers in Tier 2 regarding any work proposed in navigable waters, as appropriate.

Commenter McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District

Comment F-4-5 Section 4.10 of the Tier 1 DEIS identifies and discusses potential effects to wetlands, and Appendix G includes information on existing wetlands that have been identified within the project study area. The Regulatory Context section fails to note that federal wetlands may also be subject to Section 10 of the Rivers and Harbors Act when those wetlands are situated below the plane of the mean high water in tidal waters, and below the ordinary high water mark of non-tidal waters that the U.S. Army Corps of Engineers has determined to be navigable. We are also concerned that the Tier 1 DEIS has underestimated the amount of potential federal wetlands within the study area as USGS Quadrangles and National Wetlands Inventory (NWI) maps were utilized for their identification. These maps are broad scale and NWI maps are not available for many locations within the study area. We recommend that you also consult county soil surveys prepared by the Natural Resources Conservation Service to help identify additional wetlands within the study area and more accurately assess the five proposed alternatives before one is selected, which is when the wetlands would be field delineated and likely need verification by the U.S. Army Corps of Engineers.

Response The 'Future Analysis' section, Section 4.6.6 of the Tier 1 FEIS, discusses filing of a joint permit application under Section 10/Section 401/Section 404, as appropriate. This section acknowledges that these waterways are protected and subject to jurisdiction under these regulatory programs. The information in Tier 1 relies on existing available mapping (such as NWI mapping), but the detailed mapping and field identifications of waterways and wetlands would occur during future detailed design. Future analysis would be part of the program development in Tier 2, as specific improvements were identified and would include consulting NRCS (Natural Resources Conservation Service) soil surveys and detailed delineations of wetlands, in consultation with the U.S. ACOE.

Commenter McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District

Comment F-4-6 As outlined in the Tier 1 DEIS, Alternative 125 would have the highest amount of temporary and permanent impacts to waters of the United States, including wetlands. Based on what has been submitted to date, we believe the adverse impacts to aquatic resources associated with this alternative are more than minimal and may not meet all applicable provisions of the Section 404(b)(1) Guidelines at 40 CFR Part 230, especially in comparison of the limited additional benefits that would be gained by this alternative, which wouldn't be experienced until 2035.

Response Alternative 90B has been identified as the Preferred Alternative, based on consideration of factors such as meeting the program purpose and need, costs, and impacts. The Tier 1 FEIS also indicates that Alternative 125 will involve greater impacts to Waters of the U.S. than the other alternatives under consideration. However, Alternative 125 provides the greatest effectiveness in meeting many program performance measures including on-time performance, travel time reductions, service frequency improvements, ridership increases and automobile trips reductions. Alternative 125 creates a separate dedicated passenger rail alignment over much of its length, which is beneficial to avoiding conflicts with freight traffic. These factors have been taken into consideration in the selection of the Preferred Alternative.

Commenter McDonald, Jodi M., Chief, Regulatory Branch, U.S. Army Corps of Engineers, New York District

Comment F-4-7 Regardless of the alternative that is selected, we recommend that all efforts be undertaken to avoid and minimize the amount of temporary and permanent impacts to waters of the United States to the maximum extent practicable and that adequate compensatory mitigation plans, developed in accordance with 33 CFR Part 332, be prepared as necessary to compensate for the losses of aquatic resource functions and services for what we determine to be single and complete projects. To do this, we recommend continued consultation with the U.S. Army Corps of Engineers during future program and project development.

Response Alternative 90B has been selected as the Preferred Alternative. In Tier 2, future design, and any wetlands assessments performed, will include efforts to avoid and minimize impacts on waters of the U.S. and development of compensatory mitigation plans, as appropriate, in consultation with the U.S. ACOE.

Commenter Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary

Comment F-5-1 Agency's, 404(b)1 Guidelines, Part 230 (Title 40, 33 U.S.C. 1344(b) and 136l(a)). The Department's comments represent contributions from two bureaus, the U.S. Fish & Wildlife Service (Service) and the National Park Service.

Response The comments of both the U.S. Fish & Wildlife Service and the National Park Service are addressed below.

Commenter Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary

Comment F-5-2 U.S. FISH AND WILDLIFE SERVICE
Endangered Species Act
On April 9, 2011, the Department's U.S. Fish and Wildlife Service responded to your request for information regarding known occurrences of Federally-listed threatened and endangered species along the proposed route (see enclosure).

The DEIS states that "Information on ecological habitat and endangered and threatened species for study areas within a half-mile of the corridor centerline for all alternatives was obtained from the U.S. FWS, the NYSDEC, and the New York Natural Heritage Program. Information from the U.S. FWS on federal listing status and occurrences by county was consulted (4.13.2 Methodology) and sixteen species were identified within the study area." The Federal Rail Authority (FRA) is responsible for making the final effects determination pursuant to Section 7(a)(2) of the ESA, unless FRA has designated NYSDOT as a non-federal representative. If this is the case, please provide a copy of that designation in the environmental documentation.

The Service recommends that NYSDOT delineate the action area which is defined as "all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action" (50 CFR §402.02). Then, visit our website at: <http://www.fws.gov/northeast/nyfo/es/section7.htm> and follow the step-by-step instructions to obtain an up-to-date, official species list and information about listed, proposed, and candidate species. Then follow the steps to complete initial assessments of whether a species may be present and impacted by the proposed action. This information should be included in the Tier II EIS for our review. Pursuant to Section 7(c) of the ESA, the FRA should "conduct a biological assessment for the purpose of identifying any endangered or threatened species which is likely to be affected" by the proposed action. The Service is available to provide technical assistance in conducting this assessment.

Response

The FRA has not designated NYSDOT as a non-federal representative. USFWS lists of rare and listed species were consulted in performing the Tier 1 environmental inventory for the 1/2 mile buffer on either side of the railroads where work may be proposed. This buffer area was identified to account for indirect as well as direct impacts as a result of the proposed improvements. In Tier 2, if impacts to federally listed endangered or threatened species may occur that warrant further regulatory review, the FRA will conduct a Biological Assessment pursuant to Section 7 of the ESA, as appropriate. As part of Tier 1, the initial steps identified in the step-by-step instructions at the USFWS website (such as consulting with NYSDEC to determine the presence of listed species) have been completed. The later steps would be part of a Tier 2 assessment.

Commenter

Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary

**Comment
F-5-3**

Pursuant to Section 7(a)(4) of the ESA, federal action agencies are required to confer with the Service if their proposed action is likely to jeopardize the continued existence of the northern long-eared bat (*Myotis septentrionalis*) (50 CFR 402.1 O(a)), a species currently proposed for listing as endangered under the ESA. We expect a listing determination in October 2014. Action agencies may also voluntarily confer with the Service if the proposed action may affect a proposed species. Species proposed for listing are not afforded protection under the ESA. However, as soon as a listing becomes effective, the prohibition against jeopardizing its continued existence and "take" applies regardless of an action's stage of completion.

If the FRA retains any discretionary involvement or control over on-the-ground actions that may affect the species after listing, Section 7(a)(2) applies. Therefore, if suitable northern long-eared bat habitat is present within the proposed project area, we recommend further coordination with our office to avoid potential project delays should the species be listed. Additional information regarding the northern long-eared bat and conference procedures can be found at: <https://www.fws.gov/midwest/endangered/mammals/nleb/index.html>.

Response

The Tier 1 FEIS has been updated to include the listing, documented occurrences, and range of the northern long-eared bat, which was listed on April 2, 2015. If listed species or species proposed for listing, such as the northern long-eared bat (listed as both federally and state threatened species), may be affected, consultation will occur in Tier 2 with USFWS in

accordance with Section 7 of the ESA.

Commenter	Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary
Comment F-5-4	Until the proposed project is complete, we recommend checking our website every 90 days from the date of this letter to ensure that listed species presence/absence information for the proposed project is current (http://www.fws.gov/northeast/nyfo/es/section7.htm).
Response	The Tier 1 FEIS has been updated to reflect the listing of the northern long-eared bat, and the latest endangered and threatened species mapping data from the New York Natural Heritage Program was obtained in 2021. The listing status of species will be updated for any subsequent environmental documents prepared as part of Tier 2.
Commenter	Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary
Comment F-5-5	Any additional information regarding the proposed project and its potential to impact listed species should be coordinated with both this office and with the New York State Department of Environmental Conservation (NYSDEC) office in Schenectady, NY (telephone 518-357-2450).
Response	In Tier 2, when the Preferred Alternative, Alternative 90B, is advanced into final design, further consideration of potential impacts to listed species will occur. Further analysis with respect to project impacts will include coordination with USFWS and NYSDEC Regional offices.
Commenter	Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary
Comment F-5-6	<p>Fish and Wildlife Coordination Act</p> <p>The Department is concerned that the proposed conversion may result in potential effects on fish and wildlife resources. These effects may include an increase in wildlife mortality and injury from being struck by trains, indirect impacts from noise, vibration and visual impacts, habitat fragmentation, and connectivity (both terrestrial and aquatic). In addition, we are also concerned with the potential for railroad crossings (culverts, bridges), rock rip-rap along stream and riverbanks, pollutants, and surface runoff into waterways. Subsequent documentation should include an explanation of how NYSDOT plans to address impacts to fish and wildlife as a result of increased train speeds. The Department recommends that NYSDOT specifically address the potential for any impacts to the Hudson River, the Erie Barge Canal, the Mohawk River, the Genesee River, the Harlem River, and Ellicott Creek in the Tier II DEIS.</p> <p>The Department recommends that the project is designed to protect fish and wildlife, ensure fish and wildlife passage, incorporate avoidance and minimization measures and mitigate for adverse impacts as appropriate. The Service will provide technical assistance and comments during the Tier II DEIS review as well as during the permitting process with the U.S. Army Corps of Engineers, under Section 404 of the Clean Water Act, U.S. Environmental Protection Agency's, 404(b)1 Guidelines, and Section 10 of the Rivers and Harbors Act.</p>
Response	Tier 2 documentation will consider means of designing proposed improvements to minimize ecological impacts, such as use of fencing along the right-of-way for safety and measures to minimize impacts on waterways crossed. Ways to avoid or minimize ecological

impacts will be examined, as appropriate, in conformance with the Section 404(b)1 Guidelines as part of Tier 2 and permit approvals required under Section 404 and Section 10.

Commenter **Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary**

Comment
F-5-7

Bald and Golden Eagle Protection Act/Migratory Bird Treaty Act
Bald eagles (*Haliaeetus leucocephalus*) were federally-delisted in 2007, but remain protected under the MBTA, the BGEPA, and by the state of New York (State) as a threatened species. There are several bald eagle nests, breeding and concentration areas, and roost sites within the project corridor. The highest concentration of bald eagles in the State is along the Hudson River. In addition, two national wildlife refuges, the Montezuma National Wildlife Refuge located in Seneca Falls, New York, and the Iroquois National Wildlife Refuge in the Town(s) of Alabama and Shelby, New York, are located along the proposed high speed rail line. The refuges provide safe areas for bald eagles during the breeding season and during migration. Bald eagles, especially immature eagles, are attracted to carrion found on railroad tracks. We have witnessed an increase in the bald eagle population in the State since 2007. An increase in train speed, especially along the Hudson River, may increase eagle mortality.

The Service recommends that all bald eagle nests, roost sites, breeding, migration (including golden eagles), and concentration areas within the project corridor are identified and NYSDOT plans to minimize impacts to eagles are addressed. Refer to and follow the Service's National Bald Eagle Management Guidelines found on our website:

<http://www.fws.gov/northeast/ecologicalservices/eagle.html>, and contact the Service and NYSDOT to determine if permits are required for the proposed high speed rail project. If you have any questions regarding federal permits under the BGEPA, please contact Sarah Nystrom at the Service's Regional Office in Hadley, MA at 413-253-8952.

The MBTA protects over 1,000 species of birds which includes numerous species that are not considered to be state- or federally-listed threatened or endangered species. As such, the MBTA does prohibit the taking, killing, possession, transportation, and importation of migratory birds, their eggs, parts, and nests, except when specifically authorized by the Service. The unauthorized taking of birds is legally considered a "take" under the MBTA and is a violation of the law. Neither the MBTA nor its implementing regulations, 50 CFR Part 21, provide for permitting of "incidental take" of migratory birds. However, we recognize that some birds may be killed, even if all reasonable measures to avoid it are implemented. To minimize impacts to migratory birds during the breeding season, important bird areas and, hawk watch sites should be identified, and the breeding bird atlas along the proposed corridor should be consulted. Specific avoidance, minimization, and conservation measures should be included in the Tier II DEIS (e.g., no clearing of vegetation should occur for the proposed project between March 31 to July 15).

Response

Exhibit G-18 in Appendix G identified the presence of state-threatened bald eagle habitat in the Hudson River counties and several counties along Empire Corridor West. In Tier 2, when more detailed plans are developed for the Preferred Alternative (Alternative 90B), the potential impacts to bald eagle habitats and any appropriate avoidance or mitigation measures will be identified. However, it is anticipated that impacts to bald eagles and other protected species will be avoided to the maximum extent possible. Any Tier 2 environmental documentation prepared will address the potential impacts to bald eagles and other protected bird species and proposed mitigation measures.

Commenter **Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary**

Comment The Service recommends that the applicant visit the Service's Migratory Bird website for

F-5-8 more information (<http://www.fws.gov/migratorybirds/dmbmdbhc.html>). If you require additional information or assistance regarding fish & wildlife resources, please contact Sandra Doran, U.S. Fish & wildlife Service, at 607-753-9334. Future correspondence with the Service on this project should reference project file 2009-TA-064611 0-CPA-0003.

Response The project file number will be referenced in future correspondence with USFWS relating to the New York State High Speed Rail Empire Corridor Program.

Commenter **Raddant, Andrew L., Regional Environmental Officer, U.S. Department of the Interior, Office of Environmental Policy and Compliance, Office of the Secretary**

Comment National Natural Landmark Program
F-5-9 There are ten National Natural Landmarks (NNLs) in proximity to the project corridor. As such, it is recommended that a map be prepared to document the conclusion that only Moss Island NNL occurs within the 2,000-ft wide study area. It should also be noted that Montezuma Marshes carries the NNL designation, and that the Albany Pine Bush Preserve has recently been evaluated and deemed to contain nationally significant resources, and is presently awaiting Secretarial signature for designation as a NNL. Furthermore, the DEIS states that the Empire South section is not expected to have any impacts to natural areas. If this section includes the "Conrail" (as labeled on topographic maps) line along the Hudson River, potential impacts to Iona Island Marsh NNL should be further assessed. It should also be indicated in the table on page 4-176 that Hart's Woods and Bergen-Byron Swamp are National Natural Landmarks.
Please correct the spelling of the Northeast Regional NNL Program Manager's name in the footnote in section 4.16, and in the references, if it appears there. It should read "DiQuinzio," not "DeQuinzio." For questions regarding these specific comments, please contact Deb DiQuinzio, (617) 223-5064, deb.diquinzio@nps.gov.

Response Exhibit G-28 in Appendix G contains a map that shows parklands and National Natural Landmarks that have been designated on the overall study area map. The detailed map for each NNL obtained from the NNL Program Manager was reviewed to identify those NNL's within the 2,000-foot-wide study area for parks and recreational areas. The Montezuma Marsh NNL is shown on this map in Appendix G, but is outside the 2,000-foot-wide study area and located more than 4 miles away. Empire Corridor South extends along the east side of the Hudson River, the Iona Island NNL is on the west side of the Hudson River (more than 1,000 feet from the Empire Corridor) and will not be directly affected by the program. Hart's Woods NNL is also located at least 1 mile away from the Empire Corridor program alternatives. Alternative 125, which is not selected for advancement, would impact the Bergen-Byron Swamp NNL, and the NNL designation has been added to Exhibit 4-36. The Empire Corridor passes to the north of the Albany Pine Bush Preserve, which has been designated as a National Natural Landmark and has also been added to the table. In addition to the parklands section, these three NNLs (Iona Islands, Moss Island, and Bergen-Byron Swamp) within the ½-mile study area for ecology are also referenced in Section 4.13.3 (General Ecology and Wildlife Resources). In addition, the spelling of the NNL Program Manager in Section 4.16 has been corrected.

Commenter **Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2**

Comment The Base Alternative is limited in its capability to support the project goals. EPA lacks objections to implementation of the planned improvements.
F-6-1

Response	We agree; the Base Alternative ranks last in meeting performance objectives of the program.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-2	However, without detailed impact information, this alternative is rated EC-2- Environmental Concerns, Insufficient Information.
Response	Alternative 90A is not being advanced for further consideration. However, since the work is anticipated to be contained within the right-of-way, it is not anticipated that Alternative 90A will involve substantial environmental impacts, particularly relative to the other alternatives being considered.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-3	Physical changes would extend outside of the existing rights-of-way, but due to the nature of a Tier 1 DEIS, these impacts cannot be quantitatively defined. It is for this reason that Alternative 90B is rated EC-2 - Environmental Concerns, Insufficient Information.
Response	Alternative 90B has been selected as the Preferred Alternative. In Tier 2, further evaluation, more detailed plans, and an environmental impact evaluation will be performed, and any required Tier 2 environmental documentation prepared.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-4	Physical changes would extend outside of the existing rights-of-way, yet cannot be quantitatively defined in a programmatic DEIS. It is for this reason that this alternative is rated EC-2 - Environmental Concerns, Insufficient Information.
Response	Alternative 110 has not been selected for further evaluation, more detailed plans and an environmental impact evaluation will be performed, and any required Tier 2 environmental documentation prepared.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-5	The environmental impacts of a new corridor would be substantial, while the DEIS does qualitatively discuss the impacts, EPA is concerned that the use of a 300-foot (from the centerline of the track) study area, the same as the other alternatives, is not adequate to even qualitatively define the impacts of a higher speed rail alternative. This alternative is rated EC-2- Environmental Concerns, Insufficient Information.
Response	Alternative 125 has been dismissed from further consideration. The study area for each alternative, including Alternative 125, varied depending on the parameter being evaluated. A 300-foot buffer on either side of the corridor was used for identifying potential impacts on land uses, farmlands, surface and ground waters, and wetlands/floodplains, but the buffer was wider for other evaluations, expanding out to 1,000 feet for community/public facilities and parklands and 1/2 mile for ecological impacts and contaminated sites.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2

Comment F-6-6	Chapter 4 Exhibit 4-2-Land Use/Land Cover in the 90/110 Study Area. There are no definitions of "rangeland," "barren land" or "forest land." This should be clarified.
Response	The USGS land use/land cover information categories include the following: rangeland (herbaceous, shrub and brush, mixed), forestland (deciduous, evergreen, mixed), and barren land (dry salt flats, beaches, sandy areas other than beaches, bare exposed rock, strip mines/quarries/and gravel pits, transitional areas, mixed barren land). USGS publications define these categories further. Rangeland historically has been defined as land where the potential natural vegetation is predominantly grasses, grass-like plants, forbs, or shrubs and where natural herbivory was an important influence in its pre-civilization state. Forest Lands have a tree-crown areal density (crown closure percentage) of 10 percent or more, are stocked with trees capable of producing timber or other wood products, and exert an influence on the climate or water regime. Barren Land is land of limited ability to support life and in which less than one-third of the area has vegetation or other cover.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-7	For those alternatives that would require additional construction (i.e., alternatives 125, 110, 90B) EPA recommends that the equipment used for construction meets at a minimum Tier 4, if available, or the most stringent engine standard available at the time. We encourage the use of the Northeast Diesel Collaborative Model Construction Contract Specifications and Best practices for Clean Diesel Construction: http://northeastdiesel.org/construction.html#ModelContractLanguage .
Response	In Tier 2, consideration will be given to the Best Management Practices to be used during construction, including the use of the Northeast Diesel Collaborative Model Construction Contract Specification and Best Practices for Clean Diesel Construction.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-8	The air quality impacts to communities during the construction phase, especially communities with Environmental Justice concerns, should also be considered. To minimize emissions resulting from construction activities, in addition to using best available technology, an idle-reduction policy should be implemented and enforced during construction operations.
Response	NYSDOT intends to implement an idle-reduction policy, the details of which will be developed in Tier 2 and final design.
Commenter	Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2
Comment F-6-9	Even though the Tier I air quality analysis indicates that there is no net increase for criteria pollutants, except for a minor increase in nitrogen oxide, the increase in train service may ultimately increase diesel locomotive emissions at the local level, due to idling. Train idling has been a common concern of communities living near rail yards and train stations. An idle reduction policy and idle reduction technology should be implemented by the train owners and operators as part of a mitigation strategy, in addition to the use of the highest Tier engine available at the time of project completion.
Response	In the formulation of the program's Service Development Plan, consideration is being given to changes and potential increases in diesel locomotive emissions. Overall, the program is

anticipated to reduce automobile use and would result in a net beneficial impact on air quality emissions, when these reductions are factored in.

Commenter **Mitchell, Judy-Ann, Chief, Sustainability and MultiMedia Programs Branch, U.S. Environmental Protection Agency, Region 2**

Comment F-6-10 Section 4.19.1 - General Conformity discussion. While the Conformity discussion is adequate, it presumes that funding will come only from the FRA. If any funding for the project comes from either the Federal Highways Administration or the Federal Transit Administration, Transportation Conformity would apply, and therefore, should be discussed as well.

Response If project funding is provided by the Federal Highways Administration or the Federal Transit Administration, it is recognized that the Transportation Conformity would apply, and it will be discussed as part of the Tier 2 program documentation.

Commenter **Wertz, Trent L., Technical Assistant, Office of Nuclear Reactor Regulation**

Comment F-7-1 This type of activity is not one that the NRC regulates and therefore is not in a position to provide comments on the draft document.

Response The response of the Nuclear Regulatory Commission is recognized relating to the New York State High Speed Rail Empire Corridor Program.

Commenter **Chambers, Tom, Niagara Falls National Heritage Area**

Comment F-8-1 Excellent and much needed project. I prefer the 125 Alternative as the best way to create a competitive transit option that will attract additional visitors and spur economic development, the NGNHA, a unit of the National Park Service, supports this Initiative, pending consultation with local communities and tribal entities.

Response Comments from the public have been considered by FRA and NYSDOT in the selection of the Preferred Alternative, Alternative 90B.

COMMENT #	COMMENTER	PAGE
S-1	DiMura, John, NYS Canal Corporation	K-36
S-2	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation	K-36

Commenter	DiMura, John, NYS Canal Corporation
Comment S-1-1	In general, please change all references to the Barge Canal to the New York State Canal System or Erie Canal.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program as both the canal and the rail share a common corridor across the State of New York. The Tier 1 FEIS has been revised with updates to references to the New York State Canal System or Erie Canal. However, the references to the New York State Barge Canal Historic District have been retained, as the official name of the National Register Historic District. Appendix I contains a record of agency correspondence, and a list of streams and waterways was appended to the agency correspondence. Since this list is part of the actual correspondence record, it is not appropriate to change this list.
Commenter	DiMura, John, NYS Canal Corporation
Comment S-1-2	In addition, please make the following changes noted below in red. Deletions are bracketed and additions are underlined: [DETAILS IN LETTER]
Response	<p>The Tier 1 FEIS has incorporated the changes and corrections provided by the New York State Canal Corporation. These include the following revisions identified in your comments that were made as follows to the Tier 1 FEIS:</p> <ul style="list-style-type: none"> • Sections 4.6.3 and 4.14.4: Correction was made to replace "barge canal" with New York State Canal System, in two locations: • Sections 4.16.3 and 4.23.3: Text was corrected as follows: "...Canalway Trail System is comprised of a network of more than 300 miles of existing multi-use, recreational trails across upstate New York." • Sections 4.16.3 and 4.23.3: Text was corrected as follows: "The Canalway Trail System is comprised of four major segments: the Erie Canalway Trail, including the Old Erie Canal State Park Trail in Central New York; the Cayuga-Seneca Canal Trail, the Champlain Canalway Trail, and the Oswego Canalway Trail. Stretching from Buffalo to Albany the 360-mile Erie Canalway Trail, 277 miles of which are presently open to the public, closely follows much of the present and proposed Empire Corridor alignment."
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-1	Overall OPRHP supports the idea of High Speed Rail in New York State
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program in the context of potential impacts to parklands. Your comments have been considered by the FRA and NYSDOT in moving forward with plans for high-speed rail by identifying the Preferred Alternative (Alternative 90B).
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation

Comment S-2-2	While it appears that this project will have an overall positive impact for the state's rail transportation system, negative impacts may occur in the longer term for state park and site visitors, particularly from noise, vibration and visual impacts. OPRHP also serves as New York State's agent in administering the Land and Water Conservation Fund Act (LWCF) for the National Park Service (NPS). The Department of Transportation (DOT) must work with the Alternate State Liaison Officer (ASLO) in all matters pertaining to the conversion of LWCF Section 6(f) protected lands.
Response	Thank you for your comments on the High Speed Rail Empire Corridor Program. Noise and vibration were addressed in Section 4.21 of the Tier 1 EIS, and visual impacts are addressed in Section 4.17. In the Tier 2 process, if conversions are anticipated of Section 6(f)-protected LWCF properties, we will work closely with the Alternate State Liaison Officer of NYSOPRHP to mitigate any potential impacts with parklands or other properties that are managed by NYS Office of Parks, Recreation and Historic Preservation.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-3	Pg. ES-2 -- Second bullet on page Monroe County is listed twice in the paragraph once as an urban county and once as a "more rural" county. It should only be listed once.
Response	This page references both urban centers, such as Rochester within Monroe County, and, in the second reference to rural areas, Monroe County has been deleted.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-4	Exhibit 3-12 and 3-13 are difficult to compare and identify corresponding projects from table to map.
Response	The scale of the mapping in Exhibit 3-12 is intended to geographically show the general locations of proposed improvements, more information on the proposed improvements is provided in the table (Exhibit 3-11).
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-5	Exhibit 3-12 Descriptions should include identification of any work or staging areas required outside the rail corridor ROW
Response	At the Tier 1 (conceptual) level, these work or staging areas are not yet known, but would be identified in Tier 2 final design.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-6	Exhibit 3-13 scales of maps and keys are difficult to read and understand.
Response	The intention of the mapping in Exhibit 3-12 is to geographically show the general locations of the proposed improvements. Descriptions of the proposed improvements are provided in the table (Exhibit 3-11).

Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-7	SRP-3 Metro –North--New 3rd track. (Mp 53 – 63.5). This section of track appears to run through Hudson Highlands State Park Preserve. All construction activities must stay within the existing rail ROW to avoid impacts to parkland.
Response	Thank you for your comment that the new third track between Mileposts 53 and 63.5 passes through the Hudson Highlands State Park Preserve. It is not anticipated that any construction activity will occur outside of the existing railroad right-of-way, which formerly was built with four-tracks. More detailed plans will be developed in Tier 2.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-8	ES-13 Metro-North Poughkeepsie Yard... (Mp 71 – 75.8). This project travels through Quiet Cove Riverfront Park. This park is owned by OPRHP but operated and managed by Poughkeepsie. Impacts to parkland are of concern.
Response	Project ES-13 would be constructed entirely within the existing railroad right-of-way, which once supported multiple tracks and would not have any impact to the surrounding parklands.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-9	ES-05 Hudson Line Reliability Improvements (CP82). This Control Point is within close proximity of Mills Norrie State Parks. A map with better detail would assist in impact analysis. Perhaps showing the project locations in relationship to state lands would provide a more complete picture. Likewise, with the base track improvements between CP99 and MP 105.3 the rail ROW passes through Clermont State Historic Site. More detailed plans and maps are required for these areas to ensure impacts to parkland are avoided. Additionally near MP 130 the rail lines pass under a bridge at Schodack Island State Park. While it is difficult to determine from these maps, it appears that this area is slated for base track, signal, and grade crossing improvements.
Response	<p>Thank you for your comment discussing the possible impacts of a new interlocking and track work on the Hudson Line. Reviewing your comment more closely finds:</p> <ul style="list-style-type: none"> • Construction of a new interlocking at CP 82 near Staatsburg, New York. This new interlocking would be located to the south of the community and away from the Mills Norrie State Park. • It is not anticipated that any of the changes to the track work for CP 99 would be near the Clermont State Historic Site and would not be outside of the existing right-of-way. • The improvements at CP 130 would be within the existing right-of-way near the Village of Castleton south of the bridge for the park.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation

Comment S-2-10	ES-14 Hudson Station/Track Geometry Improvements (MP 114.5-115). The Ferry Street Bridge is also used for access to the Hudson Boat Launch, which is OPRHP owned property managed by the City of Hudson. Access to the boat launch must be maintained during construction.
Response	Improvements to the rail station at Hudson would be further evaluated in Tier 2. The importance of the Ferry Street Bridge to the community and access to the boat launch is recognized, and would be maintained in studying the constructability of the program.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-11	Exhibit 3-13 – Alternative 90A (Maps 3 & 4). On Map 4 the existing Empire Corridor appears to transect the Old Erie Canal State Historic Park in at least 2 locations. This is not illustrated by this map. Putting the state lands on maps such as these would help to illustrate impacts to state lands as a result of construction, operation, and maintenance of the new track.
Response	The locations of parklands are shown in Exhibit G-28 in Appendix G, Environmental Inventory and Impact Assessment. The intention of Exhibit 3-12 is to geographically show the general locations of improvements proposed as part of Alternative 90A. Putting all resources on these maps would render them unreadable due to the scale of the maps. Further analysis will be conducted in Tier 2, when more detailed plans are developed for the Preferred Alternative (Alternative 90B).
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-12	Pg 4-177, State Parks and Recreation Areas, The Canal Corporation is also a land owner of recreational facilities as indicated in comments on Exhibit 4-30 and should be listed along with the Heritage Areas System, State Parks System, State Forests, and Wildlife Management Areas. The Canal Corp. not only manages the NYS Canal System but the series of Canal Lock Parks and the Canalway Trail.
Response	The Overview section in the Existing Conditions, Parks and Recreation Areas includes a description of the New York State Canal System and describes the ownership of the canals and adjoining lands by the New York State Canal Corporation. This upfront section was included to highlight the importance of the canal system as a park/recreational resource in the study area and its integration with other parks and recreation areas. The title of Exhibit 4-37 has been modified to delete NYSOPRHP.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-13	[Exhibit 4-30] Table row 9 “underwater State Park”, the first three columns should read as follows: Hudson Highlands State Park underwater lands State Park Preserve Dutchess County
Response	Thank you for your comments and review of Exhibit 4-37 listing NYSOPRHP State Parks, State Preserves and State Historic Sites. The correction to the row 9 that you shared in your comment was corrected to display the correct title as you shared in your comment.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation

Comment S-2-14	[Exhibit 4-30] Table rows 21-23 “Schodack Island State Park (undeveloped)”, should have the parenthetic “undeveloped” deleted from all three rows.
Response	Exhibit 4-37 listing NYSOPRHP State Parks, State Preserves and State Historic Sites (rows 21-23) was corrected deleting the reference "undeveloped" for Schodack Island State Park.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-15	[Exhibit 4-30] Table row 24 “Lock 9 State Canal Park”, this facility is not an OPRHP facility and should not be in this table. The facility is under the jurisdiction of and operated by the NYS Canal Corporation.
Response	Exhibit 4-37 has been retitled to delete NYSOPRHP, and your comment is acknowledged that the park at Lock 9 is part of the New York State Canal System.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-16	[Exhibit 4-30] Table row 25 “Guy Park”, this facility is not an OPRHP facility and should not be in this table. The facility is under the jurisdiction of and operated by the NYS Canal Corporation.
Response	Exhibit 4-37 listing State Parks, State Preserves and State Historic Sites (row 25) was corrected for the park at Guy Park at Lock 11 that is part of the New York State Canal System.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-17	[Exhibit 4-30] Table row 31 “State Fairgrounds”, this facility is not an OPRHP facility and should not be in this table. The facility is under the jurisdiction of the Department of Agriculture and Markets. The OPRHP facility is “State Park at the Fair” and is a 0.7- acre field within the fairgrounds with a reflecting pool, tent, and exhibit area.
Response	We have revised Exhibit 4-37 in the Tier 1 FEIS to note the correct ownership of the "State Fairgrounds," as noted in your comments.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-18	Pg 4-181, Section 4.16.4 Environmental Consequences. In cases where the track passes through state park lands but has no direct construction impacts, there are still impacts to state park lands resulting from increased frequency of trains and higher speeds. Seeing trains and train noise could impact the visitors’ experience in a negative way.
Response	Thank you for your comments on the Tier 1 DEIS. Noise and vibration are addressed in Section 4.21, and impacts on visual quality are addressed in Section 4.17. The potential for visual and noise mitigation was noted in Section 4.16.5. However, acknowledgment of potential impacts on parks and recreation areas from train passbys has also been incorporated into the Tier 1 FEIS.
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation

Comment S-2-19	<p>Conservation Funds can also be awarded to municipalities for acquisition and development of municipal parks. These parks, in addition to State Parkland, are also afforded 6(f) protection against conversion to non-park purposes. OPRHP acts as an agent of the National Park Service for conversions under the LWCF. OPRHP must approve all conversions and mitigations (replacement lands) prior to submission to the NPS. Alienation is a restriction by the State on municipal park lands that are proposed to be disused for public park purposes. This requires approval by the State Legislature. There is no requisite for the grant of federal LWCF funds for municipal parkland alienation. A handbook to parkland alienation and conversion can be accessed here:</p> <p>http://nysparks.com/publications/documents/AlienationHandbook.pdf</p>
Response	<p>Thank you for your comments on the alienation of parklands and the availability of further information. In the Tier 1 EIS process, GIS mapping was used for identification of municipal parks that have received Section 6(f) funding. These parks are identified in Exhibit 4-40. In Tier 2, the assessments will further refine, if applicable, parkland identification and impact assessments, including identification of LWCF-funded and municipal parks. If impacts to Section 6(f) parklands may occur, coordination will be performed with NYSOPRHP. If alienation of municipal parkland will occur, approval from the State Legislature will be sought.</p>
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-20	<p>Pg 4-262, Section 4.23.3 Existing Conditions, Parks and Recreational Areas. Please correct this section and Exhibit 4-30 to correctly identify recreational facilities and their jurisdictional entity (e.g. OPRHP, NYS Canal Corp, etc.).</p>
Response	<p>The Tier 1 FEIS was revised to correctly identify recreational facilities and their jurisdictional entities that you outlined in your comment.</p>
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-21	<p>Pg 4-264 Exhibit 4-59 – National Memorials National Natural Land Marks, National Wildlife Refuges, and National Historic Sites and Preserves within Study Area. The “Federal Land within Hudson Highlands State Park” refers to the “Appalachian National Scenic Trail Corridor” and should be identified as such in this table. It is not part of Hudson Highlands State Park Preserve. Also, “Federal Land within Schodack Island State Park” is not recreational land and is not within Schodack Island State Park. It is adjacent to Schodack Island and is owned by the Army Corps of Engineers. It is used as a dredge spoil deposition site. It should not be identified in this list.</p>
Response	<p>Revisions were made as indicated in your comment, to the Tier 1 FEIS exhibit discussing National Memorials, National Natural Landmarks, National Wildlife Refuges, and National Historic Sites and Preserves within the study area.</p>
Commenter	Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation
Comment S-2-22	<p>Pg 4-265 Exhibit 4-60 – NYS OPRHP State Parks, State Park Preserves, State Historic Sites. This table should be corrected according to comments made above on Exhibit 4-30.</p>
Response	<p>That particular table was not also included in the Section 4(f) section.</p>

Commenter **Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation**

Comment
S-2-23

Pg 4-274 Base Alternative claims no impacts to parks or recreational areas because the alternative is “entirely within the right-of-way, no land acquisitions are anticipated, no impacts to parklands are anticipated.”

Pg 4-274 Alternative 90A asserts that all work can be contained in the existing ROW and no impacts to parklands are anticipated.

Pg 4-277 Alternative 90B explains that there will be no impacts to parklands along the Empire Corridor South because no work beyond Alternative 90A is proposed for this segment. The Empire Corridor West/Niagara Branch claims to have no impacts to parklands even though the rail passes by and through several parks.

Pg 4-281 Alternative 110 claims no impacts to parklands along the Empire Corridor South because no work beyond Alternative 90A is proposed for this segment. Along the Empire Corridor West/Niagara Branch the rail passes nearby or adjacent to parklands but will not directly affect them. Potential impacts are identified for a county recreational facility.

Pg 4-284 Alternative 125 again claims no impacts to parklands along the Empire Corridor South because no work beyond Alternative 90A is proposed for the majority of this segment. A one mile segment from Albany-Rensselaer Station across the Hudson is proposed to be new 125 mph track. No parkland is within this alignment so no parkland impacts are expected. Along the Niagara Branch no additional work beyond Alternative 90A is proposed and thusly will not affect park land. The Empire Corridor West section will have the Alternative 90A projects applied to the existing corridor and a new 125 mph track will be constructed on a parallel alignment or elevated above the existing rail. The segments of parallel alignment may have direct impacts to portions of the Albany Pine Bush Preserve, Old Erie Canal State Historic Park and a handful of municipal parks that have received LWCF funding.

Response

Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. The Tier 1 FEIS describes the potential direct impacts to parklands as a result of the Preferred Alternative and the other prospective alternatives. In Tier 2, the impacts of individual project components of the Preferred Alternative will be further studied and analyzed on adjoining parklands, and, if appropriate, mitigation strategies will be identified. Other impacts (noise, visual) were addressed in other sections of the Tier 1 FEIS. Noise and vibration are addressed in Section 4.21, and impacts on visual quality are addressed in Section 4.17.

Commenter **Alworth, Tom, Deputy Commissioner for Resources and Partnerships, NYS Office of Parks, Recreation and Historic Preservation**

Comment
S-2-24

Be advised that the scale and description of the projects and alternatives identified in this Tier 1 EIS cannot definitively say that there will be no impacts to parkland.

Impacts such as noise, vibration, air quality, access, and visual/scenic impacts will occur temporarily and permanently. These impacts to parks and park visitors will need to be addressed in the future planning/EIS steps.

Alternative 125 will have physical (land related) impacts in addition to those temporary and permanent impacts listed above. The level of detail provided in this Tier 1 EIS is insufficient to identify and analyze those impacts properly. Further detailed information and analysis will be expected in subsequent EIS Tiers as this project progresses.

Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. The Tier 1 EIS discusses the conceptual designs for the prospective corridors for Base, 90A, 90B, 110 and 125 Alternatives. In the Tier 1 FEIS, noise and vibration are addressed in Section 4.21, and visual impacts are addressed in Section 4.17. Air quality impacts are addressed in Section 4.19, and greenhouse gas emissions are addressed in 4.20. Tier 2 will further define the different supporting improvements that will require further analysis as the program moves to design and construction. A more detailed analysis will be performed in the pre-construction phase of each improvement. Alternative 125 is not being advanced for further consideration. In Tier 2, the analysis will address the extent of direct impacts (both temporary and permanent) to parklands of the Preferred Alternative (Alternative 90B).

Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-1	On page 2-9 (Section 2.2.1), please note that in addition to the PDCTC, the Poughkeepsie-Newburgh Middletown, NY MSA is also served by the Orange County Transportation Council (OCTC).
Response	Thank you for your comments on the Tier 1 EIS for the High Speed Rail Empire Corridor Program. The appropriate revisions have been made to this section of the Tier 1 FEIS.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-2	The 2035 population projection for Dutchess County (page 4-16) seems aggressive. The County's population grew by 52,000 during the 30-years from 1980-2010--a period of relatively strong economic growth, larger household sizes, and greater amounts of developable land when compared to current conditions. Yet, the project shows a growth of 61,000 from 2010-2035, which is a shorter time period that has begun with modest economic growth, smaller household sizes, and more constrained land.
Response	The population growth projections for Dutchess County in the Tier 1 FEIS for the period from 2010 to 2035 were reviewed and are consistent with the population projections available from the Dutchess County Planning and Development Department and provided through the PCTC. These projections forecasted an increase of approximately 40,000 between 2010 and 2025, which would correlate to an even greater increase in 2035.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-3	For Exhibit 4-6 (page 4-17), please note that the Census Bureau has corrected the 2010 Census data for the City of Poughkeepsie. The correct 2010 population equals 31,045, which is an increase of 995 or 3.3 percent from the 2006 estimate.
Response	The section of the Tier 1 FEIS document you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-4	On page 4-20 (Section 4.3.3), the description of the City of Poughkeepsie as the "de facto center" of the Hudson Valley should be rephrased as "the City and Town of Poughkeepsie," since the Town has a higher population than the City (45,032 compared to 31,045) and the referenced IBM facility is actually located in the Town of Poughkeepsie--the Town is also home to Marist and Vassar colleges, Dutchess Community College, Saint Francis Hospital, and a regional shopping mall. It should also be noted that the cities of Middletown and Newburgh have comparable population totals to the City of Poughkeepsie and are centers in their own right.
Response	The section of the Tier 1 FEIS document you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.

Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-5	Please correct the minor typographical error in Exhibit 4-18 (page 4-101), under the column for LWRP Municipalities: "Poughkeepsie (T)."
Response	The section of the Tier 1 FEIS document you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-6	For Exhibits 4-30 (page 4-178) and 4-60 (page 4-265), please note that Quiet Cove Park is a Dutchess County Park and should instead be listed under Exhibits 4-32 (page 4-180) and 4-62 (page 4-267).
Response	The section of the Tier 1 FEIS document you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-7	As indicated in Section 4.21.4 (Environmental Consequences), potential noise impacts will occur under all of the alternatives for Segments 1-4 (New York City through Schenectady), which includes the length of Dutchess County. We therefore request that a detailed noise and vibration analysis be conducted as part of any subsequent Tier 2 study for affected communities within Dutchess County. Special consideration should be made for high-density residential areas and national/state historic sites and parks along the corridor (e.g., Franklin D Roosevelt National Historic Site).
Response	Thank you for your comment pointing out the need for further Tier 2 studies noise and vibration analysis, relating to the High Speed Rail Empire Corridor Program and national and state historic sites and parks along the corridor. In Tier 2, the environmental studies required will include analysis of noise and vibration, as appropriate.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-8	Please note that the PDCTC approved a new Metropolitan Transportation Plan, titled Moving Dutchess, on November 18, 2011, which supersedes the referenced plan on page 7 of References. Moving Dutchess is correctly referenced in Appendix G (page G-15).
Response	The section of the Tier 1 FEIS document you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-9	Under Appendix B (Ridership and Revenue Forecasting), the 2035 population projection for Dutchess County (page B-24) appears aggressive, considering historic growth trends.

Response	Your comment discussing future population growth has been reviewed and the Tier 1 FEIS is reporting a conservative population growth. The New York Metropolitan Transportation Council projections for Dutchess County indicate an increase in population of 78,656 from 2010 to 2035, which is higher than the Tier 1 FEIS projection of 61,000 for the same time period.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-10	Under Appendix G (Existing Conditions Supporting Documentation) (page G-2), we request that the hamlets of New Hamburg (Town of Poughkeepsie) and Rhinecliff (Town of Rhinebeck), both located along the Hudson River, also be listed as communities within the Empire Corridor study area.
Response	The section of the Tier 1 FEIS document you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-11	As mentioned earlier, the Census Bureau corrected the 2010 population for the City of Poughkeepsie (31,050), which may lower its ranking among northern Hudson Valley communities (page G-19).
Response	Your comment discussing future population growth has been reviewed. The section of the Tier 1 FEIS you noted in your comment has been reviewed, and the appropriate revisions have been made to this section of the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-12	On page G-24, under "Poughkeepsie," please note that the Walkway Over the Hudson elevator at Upper Landing Park will be completed in spring 2014. Also, the number of visitors to the Walkway, which opened in fall 2009, ranges from 500,000-700,000 annually, making the referenced "750,000 since inception" seem low.
Response	The correction you noted in your comment for the Tier 1 FEIS has been reviewed, and the appropriate revisions have been made to the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-13	On page G-37 (second paragraph), please note that Staatsburg is a hamlet located in the Town of Hyde Park.
Response	The correction you noted in your comment for the Tier 1 FEIS has been reviewed and the appropriate revisions have been made to the document.
Commenter	Debald, Mark, Transportation Program Administrator, Poughkeepsie-Dutchess County Transportation Council
Comment R-1-14	Under Appendix I (Agency Correspondence), the incorporated Village of Tivoli should be included on the list communities for Dutchess County (page I-437), even though it is not a city or town. In general, all affected villages in the State should be included in Appendix I.

Response	Appendix I contains a record of agency correspondence, and the list of communities was appended to the agency correspondence. Since this list is part of the actual correspondence record, it is not appropriate to change this list. Exhibit G-26, Counties, Cities/Towns, and Villages within the APEs, in Appendix G shows the Village of Tivoli in Dutchess County.
Commenter	Eaby, P.G., Todd D., Manager, Project Review, Susquehanna River Basin Commission
Comment R-2-1	We have reviewed the following projects in question [High Speed Rail Empire Corridor Program Tier 1 Draft Environmental Impact Statement: Pennsylvania Station, New York City to Niagara Falls Station, Niagara Falls, NY] and have no comments.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program and your statement advising that the commission has no comments on the document.
Commenter	Sutter, Jr., Charles J., Planner, Westchester County Department of Public Works and Transportation
Comment R-3-1	The primary beneficiary of this HSR program is intercity passenger rail service within the State of New York. This is an objective which Westchester County supports. At the same time, Metro-North Railroad's Hudson Line is an important travel conduit for a significant number of Westchester County residents who commute daily to Mid-town and Lower Manhattan. In 2012, the last year for which figures are available, the Hudson Line provided 15.9 million one way trips. To support this level of ridership, the freight operations of CSX Transportation and Canadian Pacific Railway are restricted on the Hudson Line to evening and nighttime operations. The remainder of the time the Hudson Line is restricted to commuter passenger train operations and 13 Amtrak limited stop intercity trains. Projections through 2035 indicate that freight traffic will continue to increase and forecasts for the Metro-North's Hudson Line through 2020 indicate projected increases of 28 percent. Certain capital improvements are proposed that are of interest to Westchester County. They include: Adding a second track between MP 9 and MP 13 (including the Spuyten Duyvil Movable Bridge), Adding a new Tarrytown pocket track to support Metro-North turn backs without delaying Empire Corridor Service, Add a new signal system between Croton-Harmon and the Poughkeepsie stations-MP 32.8 to MP 75.
Response	<p>Thank you for your comments on the High Speed Rail Empire Corridor Program. Improving passenger rail service and maintaining freight operations along the Empire Corridor is the goal for the High Speed Rail Empire Corridor Program. The projects referenced in your comment to improve operations of both Amtrak and Metro-North Railroad passenger trains between New York City and Albany or Poughkeepsie in the Hudson Valley have been included in the Preferred Alternative, Alternative 90B, (and are part of Alternative 90A, a component of all of the Build Alternatives). The Preferred Alternative includes:</p> <ul style="list-style-type: none"> • Adding a second track between MP 9 and MP 13 (including the Spuyten Duyvil Movable Bridge) • Adding an additional "overtake" track between CP53 and New Hamburg in the Hudson Highlands • Adding a new Tarrytown pocket track to support Metro-North turn backs without delaying Empire Corridor Service, • Add a new signal system between Croton-Harmon and Poughkeepsie stations-MP 32.8 to MP 75. • Upgrading of Track 3 in between CP72 and CP75 in the Poughkeepsie area with

improvements to the Metro North Railroad yard facilities.

Commenter	Sutter, Jr., Charles J., Planner, Westchester County Department of Public Works and Transportation
Comment R-3-2	Westchester County generally supports increased intercity traffic as long as no detrimental impact, including financial, results on the predominant commuter rail service.
Response	The purpose of the High Speed Rail Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and to improve reliability, travel times, levels of train service, and passenger amenities. The program will improve passenger operations for both intercity and commuter rail service and will not have any detrimental impacts on existing or future commuter service.
Commenter	Branton, Donn E., Chair, Genesee County Agricultural and Farmland Protection Board
Comment R-4-1	Although the Board is supportive of improving the rail infrastructure in New York State, it cannot support the construction of a new rail corridor as proposed by Alternative 125. The impact on farmers and farmland, as well as the rural communities along this new corridor would not be justified by the estimated cost and proposed increased level of service of this new alignment. It is the opinion of the Genesee County Agricultural and Farmland Protection Board that the New York State Department of Transportation (NYSDOT) and the Federal Railroad Administration should concentrate its efforts on improving the level of service within the existing corridor as is proposed by the other alternatives in the DEIS. Any such improvements, however, should take into consideration the needs of farmers that work the lands near the corridor. For example, the decision to eliminate or improve at-grade crossings should be done in consultation with County and local highway superintendents and the farming community.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Your comments regarding potential impacts to farmlands and elimination of at-grade crossings in part pertain to Alternative 125, which has been dismissed from further consideration. Alternative 90B along the existing corridor has been selected as the Preferred Alternative. NYSDOT and the FRA will address treatment at specific at-grade crossings during final design.
Commenter	Morse, Hal, Executive Director, Greater Buffalo-Niagara Regional Transportation Council
Comment R-5-1	I am Hal Morse, Executive Director of Metropolitan Planning Organization for the Buffalo-Niagara Region. The twenty-year plan for this initiative would suggest we need to fully consider where we want our state to be in and how this service can help create that future in incremental steps together. There may be series of financial challenges during the phase as well as technology changes involving the shifts, putting corporations robust phase projects and response to the vision would help us to achieve our long-term objectives.

Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor program. The selection of the Preferred Alternative considered options for a future vision for New York State with respect to the future Empire Corridor passenger rail service. Incremental improvements will occur during the course of constructing the different components of the Preferred Alternative. In the construction of the supporting segments for Alternative 90B, the Preferred Alternative, these individual projects could begin conferring travel benefits upon completion of each segment. Full program benefits would be achieved with the completion of all of the segments along the route. The program and implementation will be a collaborative effort and evaluate new technology and a focus on many supporting industries in New York State.
-----------------	--

Commenter	Morse, Hal, Executive Director, Greater Buffalo-Niagara Regional Transportation Council
------------------	--

Comment R-5-2	<p>I also participate in the Federal Highway Administrative Mega regions initiative. The high speed rail service could possibly consider not so much as New York City and Niagara Falls but rather connecting two huge mega regions and also productivity within each of the two so to provide New York and Ontario crossing efficiency and improve rail services are noted and by national transportation strategy commissioned by the government in the last decade.</p> <p>Some basic services exist in New York City to Toronto, commuter rail service has seen some extensions to Niagara Falls, Ontario. Some service alternatives to Toronto were analyzed by amateur act, and the study they performed for the last decade also. Productivity within and between mega regions is a critical component of their ability to perform in a global level. This is well summarized by the high speed rail coalition documents in 2009.</p>
--------------------------	--

Response	Thank you for your comment on the opportunities along the Empire Corridor for connections from Buffalo to Toronto. Currently the High Speed Rail Empire Corridor Program is focused on improvements between New York City and Niagara Falls. The program will improve service that operates along Empire Corridor, including Maple Leaf service that continues into Toronto. Suggestions and recommendations by the public for improvements to the service have been considered in the development of the Service Development Plan and selection of the Preferred Alternative.

COMMENT #	COMMENTER	PAGE
L-1	DeSantis, Thomas, Senior Planner, City of Niagara Falls	K-54
L-2	Moore, Charles E., Director, City of Rensselaer Planning and Development Agency	K-56
L-3	Phillips, Jr., Howard T., Supervisor, Town of Haverstraw	K-57
L-4	McCamphill, Amy, NYC Law Department, Environmental Law Division	K-57
L-5	Colacino, Dick, Supervisor, Town of Arcadia	K-60
L-6	Cunningham, Donald, Town Board Supervisor, Town of Bergen	K-61
L-7	Hotaling, James A., Town Supervisor, Town of Brutus	K-62
L-8	Mahan, Paula A., Town Supervisor, Town of Colonie	K-63

Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-1	Also, while the study is for the Empire Corridor and the Empire Corridor technically terminates at Niagara Falls, the reality is the Maple Leaf is co-terminus with the Empire Corridor for all but the last 82 miles terminating at Union Station in Toronto, Canada. The benefit to the Empire Corridor for this short, but important, connection is missing from this TIER 1 analysis. At a minimum, a reference should be added.
Response	The scope of the Tier 1 EIS as approved by the FRA focuses on the Empire Corridor from New York City to Niagara Falls, New York. The ridership forecasts do not account for trips into Canada and therefore are conservative. The scope of the program improvements does not extend beyond New York State, but improvements to Empire Corridor service would also benefit trips into Canada and the Maple Leaf service.
Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-2	Likewise, there was no mention of a potential Buffalo Niagara Falls Express/Commuter Service. This limited service route was identified in the 2009 State Rail Plan. Again, a reference for this proposal should have been given.
Response	The High Speed Rail Empire Corridor Program, as approved by the FRA, is focused on improving rail service along the Empire Corridor from New York City to Niagara Falls. Given the conceptual nature of the Tier 1 evaluation, the Tier 1 EIS does not reference all other commuter rail initiatives underway, but Tier 2 studies may address in more detail coordination with other commuter rail studies, as appropriate.
Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-3	The City of Niagara Falls strongly supports the purpose and intent of the High Speed Rail Empire Corridor Program without reservation. The City of Niagara Falls is already a committed partner in developing the HSR system in New York, investing over \$5 million over the last decade to enhance the Empire Corridor's anchor station and re-invigorate the international gateway linking the largest Metro area in Canada with the largest Metro area in the USA. Bringing high-speed rail to New York State is or should be one of the State's most important long-range transportation priorities. At a minimum, the final recommendations of this Program must aim to: achieve higher passenger train speeds across the Empire Corridor; improve reliability, travel times, service frequency, and passenger amenities, and significantly increasing ridership, or risk failure.
Response	Thank you for your comments in support of the High Speed Rail Empire Corridor, which have been considered by the FRA and NYSDOT in the selection of the program of improvements identified (Alternative 90B) as the Preferred Alternative. In your comments, you identify many of the objectives outlined in the Tier 1 FEIS to improve intercity rail passenger service along the Empire Corridor between New York City and Niagara Falls.
Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-4	Therefore, the City of Niagara Falls supports the highest speed option that is deliverable within the shortest time and that will support the largest increase in service frequency (and ridership) across the State—but especially west of Albany.
Response	The High Speed Rail Empire Corridor Program recognizes the importance of trip times, and the FRA and NYSDOT have considered improvements to passenger rail service and their implementation times in identifying the Preferred Alternative. The Service Development

Plan for the Preferred Alternative describes the general implementation sequence of the many projects that make up the Empire Corridor Program.

Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-5	Currently, cities west of Albany have low boardings due to limited frequency, slow travel time, and poor reliability. System Ridership will increase the most if implementing a 125MPH option. Unfortunately, the cost and time required for implementation leave it less than the optimal choice at this time for New York State. The optimal choice would seem to be establishing 110 MPH as the new base as soon as possible. In addition to the clear costs/benefit analysis supporting the 110MPH Alternative, there is also the projections for economic development in cities with stations. Economic growth in New York is linked to greater mobility and better land use.
Response	Thank you for your comment on the importance on the length of time necessary to achieve travel benefits, which would be the longest for Alternative 125 among the Build Alternatives considered. Alternative 125 has been dismissed from further consideration. Although you indicate a preference for Alternative 110, Alternatives 90B and 110 have similar performance characteristics. Alternative 90B has been identified as the Preferred Alternative, as it balances performance characteristics with costs and impacts.
Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-6	Alternative 125MPH, an electrified, two-track, grade-separated 283-mile high-speed rail corridor between Albany/Rensselaer and a yet undetermined HSR Buffalo station should be the clear expectation and promise beyond the planning horizon of this study but is not an optimal starting point.
Response	Your comments regarding Alternative 125 have been considered by FRA and NYSDOT in the selection process for a Preferred Alternative, as addressed above.
Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-7	'Program's' projected schedule for implementation. It is too long and too slow to show any noticeable benefit. Who wants to wait for 25 years to get a somewhat faster train to Albany? This is simply an untenable opening proposal. It must change.
Response	Individual project improvements will become available during the course of constructing the different components of the Preferred Alternative. Alternative 90B will begin conferring travel benefits within 2-5 years of the start of construction. Alternative 125 has been dismissed from further consideration, and a major drawback was that it would not confer benefits until completion of the first major segment, around 15 years after the start of construction or later. The completion of the different program components and implementation of service initiatives were a focus in the development of the Service Development Plan.
Commenter	DeSantis, Thomas, Senior Planner, City of Niagara Falls
Comment L-1-8	Instead of four 5-year construction intervals, begin at both ends of the Corridor simultaneously and double the amount of construction in the first two 5-year construction intervals. The proposed program scheduling, used in the TIER 1, makes only marginal improvements in service in four 5-year steps, and will take 20-25 years to complete (~\$1.75B each four 5-yr intervals). The schedule as proposed cannot become the recommended schedule. Better to make most of the improvements and deliver most of the results in two 5-year cycles of construction, then complete the remaining work over the next

five years and complete the entire program in 15 years—not twenty or more (~\$2.65B each two 5-yr interval, plus \$1.75 per one 5-yr interval).

Response The program schedule and implementation were a consideration in identifying the Preferred Alternative (Alternative 90B). Since 90B requires less right-of-way acquisition than Alternatives 110 and 125, it can be implemented more quickly and at less expense. Program phasing and service initiatives are a focus of the Service Development Plan.

Commenter **Moore, Charles E., Director, City of Rensselaer Planning and Development Agency**

Comment L-2-1 For nearly a half a century a cantilevered walkway on the south side of the Livingston Avenue Bridge made it possible for pedestrians and bicyclists to easily and safely cross the Hudson River between Rensselaer and Albany. New York State's High Speed Rail investment, and replacement of this historic crossing, will provide an opportunity to replace the walkway in a cost-effective and timely manner. Replacement of the Walkway should be identified in each and every alternative scenario outlined by the Empire Corridor Tier I Draft Environmental Impact Statement (DEIS).

Response The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. The Livingston Avenue Bridge Project has independent utility due to its physical condition. The FRA and NYSDOT are currently engaged in this work including preliminary engineering and environmental analysis. For more information on the Livingston Avenue Bridge, please visit the LAB project website:
<https://www.dot.ny.gov/display/projects/livingstonavebridge>.

Commenter **Moore, Charles E., Director, City of Rensselaer Planning and Development Agency**

Comment L-2-2 Located in the heart of the region a walkway on the Livingston Avenue Bridge is critical for economic development and quality of life investments needed to sustain a 21st century workforce. Toward that end, the City of Rensselaer has made significant efforts to develop its waterfront to attract tourists, residents, and commercial enterprise. We are working to build a waterfront trail and boardwalk supported with NYS Department of State funds and are actively applying for grants to complete the trail north of the Livingston Bridge. Numerous studies have planned a trail following the river north of the City of Troy. The City of Rensselaer's Common Council passed a resolution in support of restored Bicycle and Pedestrian accommodations on a rebuilt Livingston Avenue Bridge in February of 2012. The not for profit Parks and Trails New York has a good summary of many studies funded with local government, state and federal dollars, that have included recommendations of a rehabilitated walkway on the Livingston Avenue Bridge. Please ensure that the Empire Corridor Tier I Draft Environmental Impact Statement fully acknowledge the decade of planning and development of trails on the Rensselaer side of the River and the critical role the Walkway plays in quality of life and livability for the capital region.

Response The Tier 1 FEIS for the Empire Corridor Program will note the numerous comments received regarding the Livingston Avenue Bridge and the detailed analysis this project will undergo to select the best alternative for this project. For more information on the Livingston Avenue Bridge Project, please visit the LAB project website:
<https://www.dot.ny.gov/display/projects/livingstonavebridge>.

Commenter **Phillips, Jr., Howard T., Supervisor, Town of Haverstraw**

Comment My only comment is that there continues to be a need for high speed rail and improvements

L-3-1	to our transportation infrastructure. In that light, I firmly support the proposed system improvement alternatives to intercity passenger rail services along the 463-mile Empire Corridor. Such improvements will translate into more people utilizing the rail system, more destination alternatives and support of greater economic development.
Response	Thank you for your comments in support of the High Speed Rail Empire Corridor Program, which were considered by the FRA and NYSDOT in selecting a program of improvements (the Preferred Alternative) to advance into Tier 2.
Commenter	McCamphill, Amy, NYC Law Department, Environmental Law Division
Comment L-4-1	The environmental review should include a transportation analysis of new auto, taxi, and pedestrians trips generated by each build alternative and for each build year, so that the potential traffic and other impacts to the streets and sidewalks surrounding Penn Station and the Bronx Station can be evaluated. For the build years 2018 and 2035 and for each alternative, the environmental review should include a breakdown of projected ridership by weekday, peak hour, off-peak hour, weekend, and season. the travel demand assumptions should include: projected vehicle and pedestrian trip generation - trip origin and destination; geographical distribution of where riders are originating; modal split; temporal distribution; vehicle occupancy; the station's access points (entrances and exits) to be affected by the increase in ridership; affected sidewalks, crosswalks, and corners; Levels-of-Service projection for each pedestrian element; and pedestrian/rider flow diagrams.
Response	Detailed traffic modeling would be performed as part of Tier 2 environmental analysis required for the Preferred Alternative, as appropriate.
Commenter	McCamphill, Amy, NYC Law Department, Environmental Law Division
Comment L-4-2	the environmental review should address the following specific impacts: 1. Safety Impacts. The environmental review should include a safety assessment of the impacts to Penn Station and Bronx Station of increased ridership. 2. Cumulative Development Impacts. The environmental review should assess the effects of surrounding development at Penn Station, including 15 Penn Plaza (the Pennsylvania Hotel site), the relocation of Madison Square Garden, and the East Midtown Rezoning. 3. Cumulative Transportation Impacts. The environmental review should assess the effects of future transportation improvements in and around Penn Station, including the Hudson Yards/#7 Subway Extension, the Western Rail Yards, Moynihan Station, the Metro-North Penn Station Access Project, the Gateway Project, and the potential Northeast Corridor improvements.
Response	The High Speed Rail Empire Corridor Tier 1 EIS evaluates a range of corridor-level service improvements for the purpose of making decisions on corridor-level service, including service reliability, service frequency, and train speeds. Section 4.24 and Appendix G.21 address indirect and cumulative impacts. Because this is a Tier 1 assessment, the Tier 1 FEIS does not evaluate the site-specific needs at each of the corridor stations, such as Penn Station. These may be addressed, as appropriate, in either the Tier 2 studies or as part of the individual station projects.
Commenter	McCamphill, Amy, NYC Law Department, Environmental Law Division
Comment	The DEIS includes as a component of all build alternatives the installation of approximately

L-4-3 four miles of second track near and across the Spuyten Duyvil Bridge. This installation would occur adjacent to New York City Department of Parks and Recreation ("Parks Department") property--specifically, Inwood Hill Park, Riverdale Park, and potentially portions of Fort Washington Park. A brief description of the Spuyten Duyvil improvement is contained in a Capital Improvement Project Fact Sheet in the 2005 Plan, but is not included in the DEIS.

The potential impacts on adjacent park property must be evaluated in the environmental review. In particular, the following impacts must be addressed:

1. Pedestrian Bridge/Greenway Impacts. The environmental review should indicate whether the installation of additional track in this section or any proposed changes in service would require replacement or modification of any existing pedestrian bridges. If extensive reconstruction is involved, the Spuyten Duyvil Bridge work should be considered as a potential opportunity for accommodating multiple transportation modes (e.g., a bike path) and expanding the greenway network.

2. Rock or Tree Removal Impacts. The environmental review should identify whether the installation of additional track or the modification of the Spuyten Duyvil Bridge would require rock outcrop removal in the sections near Inwood Hill Park and/or Fort Washington Park.

3. Construction Impacts. The environmental review should identify the type, intensity, and duration of construction activities necessary to install this segment of track, to evaluate construction impacts on adjacent park property.

Response The pre-construction analysis for improvements to the Empire Corridor at Spuyten Duyvil would be conducted as part of Tier 2, and will take into consideration impacts on adjacent parks, before proceeding with any improvements to the tracks and infrastructure along the Amtrak Empire Connection. It is anticipated that any improvements would be strictly limited to within the existing railroad right-of-way, and would include reinstallation of tracks.

Commenter **McCamphill, Amy, NYC Law Department, Environmental Law Division**

Comment **L-4-4** The Catskill and Delaware Aqueducts are essential components of the drinking water supply system for the City and numerous upstate communities. Construction of a third track from New Hamburg to Cold Spring, as proposed in all build alternatives, could result in impacts to the Hudson River Pumping Station ("HRPS") intake; the Delaware Aqueduct Shaft 6 dewatering conduit; the Catskill Aqueduct Hudson River Pressure Tunnel ("HRPT"); and the Hudson River Drainage Chamber ("HRDC"). Potential impacts which must be addressed include:

1. Construction Impacts. Construction work for the third track, including potential blasting of the Breakneck Ridge to widen the existing Breakneck Tunnel, may have damaging impacts to the HRPT and HRDC. These facilities' buildings and some of their equipment are nearly 100 years old. Moreover, construction activities may require relocation or disturbance of the exterior facility appurtenances which are necessary to the HRDC's function.

2. Ingress and Egress Impacts. Construction of the third track will impede access across the tracks to the HRDC and the Shaft 6 outfall for maintenance and normal operations.

3. Land Use Impacts. The construction of the third track will include an increase in the width of the railbed. This will likely extend outside of the existing right-of-way and encroach on City lands. The lands in and around the HRDC and the HRPS are limited in size for their

current operational and maintenance requirements. Any impairment or loss of City lands in and around these and other City assets in the watershed would likely impact operations, and may have a severe impact on the City water supply.

Response Impacts would be evaluated in the pre-construction phase, however, the Breakneck Mountain Tunnel consists of twin bores that can accommodate four tracks, and it should not be necessary to incur any significant disturbance of the mountain or surrounding area. Any additional tracks would be contained within the existing right-of-way, which once supported a four track right-of-way between Garrison and Barrytown a distance of 46 miles.

Commenter **McCamphill, Amy, NYC Law Department, Environmental Law Division**

Comment L-4-5 Accurate Freight Volumes for Impact Analysis. Section ES-2.1 states that "Empire Corridor South has . . . limited freight operations of approximately four trains a day." Section 2.5, Freight Operations, states that "freight service on the Hudson Line consists of through freight limited to a nighttime window and several locals (four) per day." However, freight rail activity into and through New York City is increasing. Therefore, the environmental review should clarify that the freight traffic volumes assigned to the Empire Corridor South throughout the DEIS reflect current, 2014 volumes, and that these estimates incorporate increases in volume (for example, increases associated with the SWMP) that are anticipated in the near future.

Response The Tier 1 FEIS includes operation simulations and supporting modeling that accounted for future growth of freight traffic.

Commenter **McCamphill, Amy, NYC Law Department, Environmental Law Division**

Comment L-4-6 Incorporating Infrastructure Upgrades into the Analysis. The Bronx's Hunts Point Terminal Produce Market ("HPTPM") currently receives over 2,000 loaded, time sensitive produce cars annually via the Hudson Line. Intermodal service is currently prohibited on the Hudson Line due to conflicts with the third rail and the air draft restrictions of many bridges along the line. However, long-term redevelopment plans for HPTPM include major improvements to its rail facilities, including additional sidings, cross-docking platforms, and the capacity to accept unit trains. Please ensure that all freight projections include capacity for increased freight movements to HPTPM via the Hudson Line, including the possibility of handling unit trains bound for HPTPM on the Hudson Line. When considering specific infrastructure upgrades, the environmental review should account for improvements to facilitate freight mobility of industry-standard, double-stack container railcars, including where appropriate: 1) increasing the height of bridges to 22 feet, thereby eliminating existing air draft restrictions, and 2) adjusting the horizontal clearances to accommodate national-standard intermodal well cars.

Response Thank you for your comments on the importance of preserving freight rail traffic capabilities to New York City and the Hunt's Point Terminal Produce Market. The High Speed Rail Program focused both on improving passenger train operations and minimizing the impact of the supporting projects on freight train operations. Several of the projects that are part of improving rail operations on the Hudson Line focus on reducing conflicts between passenger trains and freight movements. As the supporting projects are moved forward, preserving and improving existing overhead and horizontal clearances will be part of the design criteria. It will be a critical part of all new projects to examine potential opportunities to improve the horizontal and vertical clearances for freight on the Hudson Line. Adding greater clearances on the route may be challenged by earlier station construction projects on the Metro-North Railroad area of the route, where high-level platforms in stations or the electric traction third rail system may prevent the movement of freight cars that exceed the current clearance limitations on the route. Most of the new

overhead bridges and pedestrian walkways on the route have been built to the 22-foot clearance as you note in your comment.

Commenter **McCamphill, Amy, NYC Law Department, Environmental Law Division**

Comment L-4-7 Rescheduling Effort from the 2005 Plan. The 2005 Plan identified as part of its preferred scenario a "'clean slate' rescheduling effort" for the Hudson corridor, See 2005 Plan, Sections 2.3.2--2.3.3. The DEIS incorporates a suite of capital improvements from the 2005 Plan into its build alternatives, but does not appear to reference the rescheduling. This should be clarified through the environmental review.

Response The scheduling of supporting projects will be further refined as the FRA and NYSDOT advance the Preferred Alternative for the High Speed Rail Empire Corridor Program, as part of future Tier 2 studies.

Commenter **McCamphill, Amy, NYC Law Department, Environmental Law Division**

Comment L-4-8 Alternatives Analysis. Given the higher capital cost of Alternative 110 compared to Alternative 90B (\$6.25 billion compared to \$5.58 billion, see DEIS Exhibit 6-9), along with the higher operating cost (\$173 million annual compared to \$171 annual, see id.), and the small, arguably negligible differences in operational performance between these two alternatives, the environmental review should more clearly explain the revenue and cost-benefit analyses supporting its conclusion that Alternative 110 is the most cost-effective alternative. DEIS 6-14.

Response The reason Alternative 110 is deemed "most cost-effective" is because it would have the lowest operation subsidy per rider, approximately \$9 per rider vs. approx. \$12 per rider for the next lowest alternative, Alternative 90B. Alternative 90B has been selected as the Preferred Alternative, due to its lower cost, similar operational characteristics, and lower impacts compared to Alternative 110.

Commenter **Colacino, Dick, Supervisor, Town of Arcadia**

Comment L-5-1 My intention is to receive your input and support for the goal of finally bringing passenger rail service to Wayne County. Studies have already been completed which clearly show that adding a station here would generate enough ridership to meet the criteria set forth by both Amtrak and the N.Y. State DOT. The study, completed in 2006 was done specifically for Lyons, N.Y., which is only six miles away from Newark, N.Y., which is located in the Town of Arcadia. While I have supported the initiative in Lyons, the proposal has been delayed for over twenty three years for a multitude of reasons or excuses. Quite frankly, twenty three years is way too long to wait for such a valuable asset for our citizens and visitors to the Finger Lakes Region. In fact, since the 2006 study, various factors have changed which would logically add considerably to the earlier ridership projections. One major factor is our economy and the price of gasoline which has skyrocketed since that time. Our area has also become a vibrant tourist destination with the increasing popularity of the Finger Lakes Wine Trail as well as water sports and relaxing on our beautiful and pristine lakes. Skiing, hiking, biking, snowmobiling, shopping and dining are also very popular in the region along with the Erie Canal and other historic sites. I am prepared to propose an initiative to simply move the stop a short distance to Newark, which would likely have the same ridership or even more than in Lyons due to our central location and proximity to lodging and services. Please keep in mind that the area between Rochester and Syracuse is the longest stretch on the system from New York City to Niagara Falls without a stop.

Response The Tier 1 EIS for the Empire Corridor evaluated a range of corridor-level service improvements for intercity passenger rail with the purpose of making decisions on system

wide level service, including service reliability, frequency, and train speeds. The Tier 1 FEIS considers using the existing stations in each of the alternatives at this time; the inclusion of additional stations along the Empire Corridor could be part of future studies for expanding service.

Commenter **Colacino, Dick, Supervisor, Town of Arcadia**

Comment
L-5-2 Would like a passenger station in Newark, Wayne County. This is an area of NY State with the longest distance between two stations – Rochester and Syracuse – a ridership study a few years ago in Wayne County supports the stop, even if it would stop twice per day in both directions.

Response Currently, the alternatives discussed in the Tier 1 EIS describe the stations that will be served in each option. Additional stations along the route could be considered in the future. The addition of stations to the intercity rail service route would require additional criteria to be met including design, operations, ridership and revenue criteria. Comments from agencies and the public have been considered by the FRA and NYSDOT in selecting a program of improvements to advance into Tier 2.

Commenter **Colacino, Dick, Supervisor, Town of Arcadia**

Comment
L-5-3 Wayne County has been looking for a train station for twenty-four years and I would like to see a train station built in Wayne County from the Town of Arcadia to the Village of Newark. It is the population hub of Wayne County. I'd like to say that the longest distance between two stations is Rochester and Syracuse. That's one reason why I would like to see it built there. We have land along the current railroad tracks. I'm not sure if it would be the same routes that they would be using for the new passenger rail, but hopefully it will be.

I'd like to say that it would bring hundreds or thousands of people to the Finger Lakes area. Right now, as you know, we have over two hundred wineries.

Response Comments from local officials have been considered as part of the Tier 1 DEIS review process. The Tier 1 EIS for the High Speed Rail Empire Corridor Program evaluated a range of corridor-level service improvements for intercity passenger rail with the purpose of making decisions on system-wide level service, including service reliability, frequency, and train speeds. The Tier 1 FEIS considers using the existing stations for each of the alternatives. Your comment on inclusion of an additional station at Newark is noted. Adding new stations along the Empire Corridor could be part of studies for expanding service in the future.

Commenter **Colacino, Dick, Supervisor, Town of Arcadia**

Comment
L-5-4 I would like to also make a comment that I don't think that 105-mile-an-hour speed is High Speed Rail.

Response The operating speeds discussed in the Tier 1 EIS are consistent with the speed thresholds and requirements for different classes of track for high speed rail operations outlined by the Federal Rail Administration (FRA). The FRA characterizes high-speed rail with speeds in the range of 90 to 125 mph as "Regional High-Speed Rail" with the objective to serve mid-sized urban areas on dedicated or shared track.

Commenter **Cunningham, Donald, Town Board Supervisor, Town of Bergen**

Comment
L-6-1 Town of Bergen submits this letter objecting to the proposed project based on the following;

1. The Town of Bergen is directly impacted by the proposed routes for this system with one of the routes completely destroying a linear park with access to a nature center and negatively impacting a National Natural Landmark known as the Bergen Swamp. The other alternative route, along existing rail, cuts directly through our Village increasing safety concerns for motorists and community members.

Response The Tier 1 EIS documents in several sections that the conceptual alignment of Alternative 125 would cross through the Bergen Swamp (e.g. pages 4-93 and 4-132). Although Alternative 125 has been dismissed from further consideration, the alignment used for the Tier 1 EIS analysis is conceptual in nature and only one of several possible alignments that could have been used if NYSDOT and FRA had selected Alternative 125 as the Preferred Alternative. The Preferred Alternative (Alternative 90B) would follow along the existing railroad alignment, which is situated at least two miles south of the Bergen Swamp National Natural Landmark and would not impinge on the swamp itself.

Commenter **Cunningham, Donald, Town Board Supervisor, Town of Bergen**

Comment L-6-2 2. With consideration to the financial investment this program will require the Town of Bergen finds it more prudent to direct funds towards repairs and improvements of existing roads and bridges which have been neglected and underfunded.

3. The Bergen Town Board believes that if a High Speed Rail system was to be successful and prosperous it would be considered, facilitated, and constructed by the private sector. Unfortunately passenger rail has notoriously been unprofitable and a project of this nature would be a waste of valuable taxpayer dollars that could be better utilized improving the existing transportation infrastructure.

Response Comments from the public on the High Speed Rail Empire Corridor Program have been considered by FRA and NYSDOT in the selection of a program of improvements to be carried into Tier 2. The Preferred Alternative was chosen to balance various considerations of concern to the public, such as performance characteristics, costs, and impacts.

Commenter **Hotaling, James A., Town Supervisor, Town of Brutus**

Comment L-7-1 The Brutus Town Board would like to express their interest in establishing a station or hub for the potential high speed rail in our community. Recently, The Town of Brutus and Village of Weedsport approved a Comprehensive Plan that encompasses both communities and one of the objectives is to study the feasibility of developing a commuter rail between Rochester and Syracuse that would pass through the Town of Brutus/Village of Weedsport. Our communities are situated in the center of Cayuga County and are easily accessible from the north/south by using State Route 34 and east/west using State Route 34. We would welcome the opportunity to meet with you to discuss a potential station/hub in our area.

Response Comments from local officials have been considered in the Tier 1 DEIS review process. The Tier 1 EIS for the High Speed Rail Empire Corridor Program evaluated a range of corridor-level service improvements for intercity passenger rail with the purpose of making decisions on system wide level service, including service reliability, frequency, and train speeds. The Tier 1 EIS considers using the existing stations for each of the alternatives. Your comment on the inclusion of an additional station at Weedsport is noted. Adding new stations along the Empire Corridor could be part of studies for expanding service in the future.

Commenter **Mahan, Paula A., Town Supervisor, Town of Colonie**

Comment We all concur that we have fundamental concerns about the safety of the three grade level

L-8-1	<p>rail crossings in Town in the event of high-speed rail traffic. We do not believe the crossings as currently configured would provide the necessary degree of safety for drivers or pedestrians.</p> <p>Several years ago there were discussions about building bridges to carry traffic above the tracks, especially at the heavily trafficked Lincoln Avenue crossing. Perhaps this is an option that can be considered going forward.</p>
Response	<p>As part of the Base Alternative, improvements to grade level rail crossing gates that prevent motor vehicle drivers from attempting to drive around the gates and other warning device systems were to be used in the project limits of the Albany – Schenectady Double Track project between MP 143.2 to MP 160.3, which extends through the Town of Colonie. between approximately MP 151 and MP 154. The Tier 1 EIS anticipates that grade crossing improvements will be necessary for each of the Build Alternatives. The details of these improvements would be developed in Tier 2 for the Preferred Alternative (Alternative 90B). Comments from the public and community officials, relating to the safety of the operation of the high speed trains for both grade crossings and along the right-of-way, were an important consideration for FRA and NYSDOT in selecting the program of improvements (Preferred Alternative).</p>
Commenter	Mahan, Paula A., Town Supervisor, Town of Colonie
Comment L-8-2	<p>Furthermore, if high speed passenger trains are to travel through the corridor, we feel additional studies need to be done regarding noise, sight, or fuel pollution relative to the propulsion system to be utilized.</p>
Response	<p>NYSDOT and the FRA examined the potential for noise, visual, and air quality impacts for the program as documented in the Tier 1 EIS. The Tier 1 EIS evaluated potential noise impacts of the proposed program improvements and concluded that the program would not increase noise levels over the Base Alternative in the corridor between New York City and Schenectady.</p> <p>In the Town of Colonie, the program will occur within an existing railroad corridor and will have no significant visual changes to the character of the rail line.</p> <p>The air quality analysis done for this program shows that no significant adverse air quality impacts are projected. Alternative 90B (the Preferred Alternative) would result in a reduction of approximately 33,000 metric tons per year of greenhouse gas emissions. Although the changes are small in the regional context, the net result is a reduction in all pollutants other than NO_x. The projected increase in NO_x emissions and decrease in VOC emissions represent less than 0.3 percent of emissions in each area (varies by region). The Preferred Alternative will result in a net reduction of 61 tons per year of CO in the New York-New Jersey-Long Island non-attainment area (for 8-hour ozone), with smaller reductions on VOCs (between 1.8 to 4 tons in the five cities analyzed).</p>
Commenter	Mahan, Paula A., Town Supervisor, Town of Colonie
Comment L-8-3	<p>But regardless of the merits of the proposed rail enhancements, the safety of Colonie residents must remain my primary concern.</p>
Response	<p>Thank you for your comment regarding public safety. For NYSDOT and the FRA, public safety is one of the highest priorities. In advancing the Preferred Alternative (Alternative 90B) in Tier 2, the program will be designed and constructed to the appropriate safety standards. Section 2.6 and Chapter 3 of the Tier 1 FEIS address safety considerations and state that further evaluation of grade crossings will be conducted in Tier 2, when a Preferred Alternative is advanced. These evaluations and further design studies to enhance or</p>

eliminate grade crossings will be performed in Tier 2 and final design.

COMMENT #	COMMENTER	PAGE
T-1	Shavitz, Ian A., Oneida Indian Nation	K-66
T-2	Toth, MA, MS, Jay, Archeologist, Seneca Nation Tribe	K-67
T-3	Hartley, Bonney, Assistant, Stockbridge-Munsee Tribal Historic Preservation Office	K-67

Commenter	Shavitz, Ian A., Oneida Indian Nation
Comment T-1-1	The [Oneida] Nation has significant concerns about the impacts that the Project could have on historic properties; resources of religious and cultural significance to the Nation; Nation lands; Nation economic enterprises; and the physical environment of the Nation's Reservation.
Response	The concerns of the Oneida Nation are noted and were considered in the selection of Alternative 90B as the Preferred Alternative by NYSDOT and FRA.
Commenter	Shavitz, Ian A., Oneida Indian Nation
Comment T-1-2	<ul style="list-style-type: none"> * FRA's federal trust obligation mandates the protection of Nation resources and lands. * NYSDOT/FRA must protect Nation cultural resources. * NYSDOT/FRA must consider impacts to Nation Lands when planning the Project and selecting an alternative.
Response	If tribal interests may be potentially affected by the program, FRA and NYSDOT will continue to consult with the Oneida Nation, as appropriate, during the process of identifying significant cultural resources in the APE's and identifying measures to avoid, minimize, or mitigate any potential for adverse effects pursuant to Section 106 of NHPA, NEPA, and other applicable legislation.
Commenter	Shavitz, Ian A., Oneida Indian Nation
Comment T-1-3	NYSDOT/FRA must protect Atunyote Golf Course.
Response	The FRA and NYSDOT would like to thank the Oneida Indian Nation for their interest in the High Speed Rail Empire Corridor Program. We are aware of the importance of the Atunyote Golf Course to the Oneida Indian Nation. The Preferred Alternative for the program will follow the existing Empire Corridor rail alignment and will have no impact of the golf course or any lands of Oneida Indian Nation.
Commenter	Shavitz, Ian A., Oneida Indian Nation
Comment T-1-4	When considering performance objectives and environmental impacts, it becomes clear that NYSDOT/FRA should select Alternative 110.
Response	Comments of the Oneida Nation, regarding Alternative 110, were considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B, similar to Alternative 110, will follow the existing rail corridor. Alternative 90B would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. For reasons of safety, CSXT, the owner of the right-of-way, requires a 30-foot track separation between freight and passenger tracks when passenger trains operate at 110 mph. In many places on the route, this is only possible by acquiring significant additional property. Because of the required property acquisitions, Alternative 110 would have significantly higher costs and greater potential for environmental impacts than Alternative 90B, while only achieving a modest improvement in overall performance.
Commenter	Shavitz, Ian A., Oneida Indian Nation

Comment T-1-5	<p>Alternative 125 is the only alternative that requires a new alignment, on a new right of way in the majority of the Empire Corridor West. This will result in a significant adverse effects and ramifications for the Oneida Nation, and therefore the Oneida Nation does not support NYSDOT/FRA selecting Alternative 125 for Tier 2 study.</p> <p>Alternative 125:</p> <ul style="list-style-type: none"> * Has the greatest potential to destroy Nation cultural resources and historic properties. * Greatest impact on Nation Lands. * Maximum impact on the environment * Greatest Cost Implications <p>It is questionable whether the U.S. Army Corps of Engineers can properly issue a Clean Water Act Section 404 permit for Alternative 125. Given the impacts on Oneida Nation Lands and resources, if NYSDOT/FRA selects the Alternative 125, the representative alignment should not be carried forward.</p> <p>Selecting Alternative 125:</p> <ul style="list-style-type: none"> * Will have significant impacts on Oneida Nation cultural resources, trust land and economic enterprises. * Would require extensive archaeological surveys * Will cross soon to-be acquired Oneida Nation Trust Lands
Response	<p>The comments from the Oneida Nation were considered in the selection of the Preferred Alternative. As documented in the Tier 1 FEIS, Alternative 125 was dismissed in large part based on generally greater potential for impact than the other alternatives. The U.S. Army Corps of Engineers has provided FRA and NYSDOT with comments on the Tier 1 DEIS. Under Section 106 of the National Historic Preservation Act, if tribal interests may be potentially affected by the program, FRA and NYSDOT would continue consultation with the Oneida Indian Nation during Tier 2 level analyses.</p>
Commenter	Toth, MA, MS, Jay, Archeologist, Seneca Nation Tribe
Comment T-2-1	<p>Could you clarify for me how many new bridges and stations are planned for the Niagara Falls-Buffalo-Genesee section?</p> <p>We have worked with NYDOT on incorporating Seneca designs in to bridges and local waysides with Seneca cultural theme.</p> <p>We would be interested in seeing this done on this rail project for the bridges and stations. This concept would add to the tourism interests and reflect positively the history of the area.</p>
Response	<p>There are approximately 41 bridges on the Niagara Branch and three stations from Niagara Falls to Buffalo: Niagara Falls Station, Buffalo-Depew Station, and Buffalo-Exchange Street Station, which have all been reconstructed or modified since the publication of the Tier 1 DEIS. The Seneca Nation's desire to incorporate Seneca motifs into bridge and local wayside designs is noted. If tribal interests may be potentially affected by the program, FRA and NYSDOT would continue consultation with the Seneca Nation under Section 106 of the National Historic Preservation Act as the program progresses.</p>
Commenter	Hartley, Bonney, Assistant, Stockbridge-Munsee Tribal Historic Preservation Office
Comment T-3-1	<p>We are interested in staying a Section 106 consulting party specifically for the portions of the project from New York City to Schenectady, as this portion of the project is within our Stockbridge-Munsee Mohican area of interest.</p>
Response	<p>As program planning and environmental analyses progress at the Tier 2 level, if tribal interests may be potentially affected by the program, FRA and NYSDOT look forward to continuing consultation with the Stockbridge-Munsee to identify properties of significance to the Nation that may be affected by the program and to identify measures to avoid,</p>

minimize, or mitigate any potential adverse effects.

Commenter **Hartley, Bonney, Assistant, Stockbridge-Munsee Tribal Historic Preservation Office**

Comment
T-3-2 In reviewing the maps of the known sites where Native American cultural materials have been found in the APE, we have identified 11 that are of particular concern to us. However, the DEIS does not provide us with specific enough information on the project construction plans to determine the extent to which these sites risk being adversely effected by constructing in new soils, or if all the construction is occurring on already disturbed areas on the existing railway. As the project alternative is finalized and these detailed construction plans are better known, we will review and provide our determination.

Response The comments from the Oneida Nation were considered in the selection of the Preferred Alternative. As documented in the Tier 1 FEIS, Alternative 125 was dismissed in large part based on generally greater potential for impact than the other alternatives. As program planning and environmental analyses progress at the Tier 2 level, if tribal interests may be potentially affected by the program, FRA and NYSDOT will continue consultation with the Stockbridge-Munsee to identify properties of significance to the Nation that may be affected by the program and to identify measures to avoid, minimize, or mitigate any potential adverse effects.

Commenter	Goss, Raymond A., President, Buffalo and Pittsburgh Railroad, Inc.
Comment RR-1-1	The Buffalo & Pittsburgh Railroad wishes to express its support for the "Base Alternative" that has been presented in the Draft Environmental Impact Statement (DEIS) in regards to the proposed development of a high-speed rail corridor across New York State. Of the options presented, this alternative would enable improvements to Amtrak's Empire Corridor without adversely impacting freight rail operations along the route. We therefore respectfully request your support of the "Base Alternative"
Response	Thank you for your comments, which have been considered as part of the Tier 1 EIS review process. The Preferred Alternative, Alternative 90B, will improve passenger rail service while maintaining freight operations along the Empire Corridor. Alternative 90B would result in better segregation of passenger trains from freight trains than the Base Alternative. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.
Commenter	Edwards, Gerard F., Area Representative Real Estate, Canadian Pacific / Delaware & Hudson
Comment RR-2-1	It is obvious from the report the 110 Alternative has the best benefit to cost ratio and should be the alternative pursued.
Response	Thank you for your comments on the 110 Alternative, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. Compared to Alternative 110, Alternative 90B will involve lesser costs and impacts, with fewer property displacements, while also achieving the best on-time performance for Amtrak service in 2035. As shown in Exhibit 6-8 of the Tier 1 FEIS, Alternative 90B would also result in the least delay-minutes per 100 train miles operated for freight trains.
Commenter	Edwards, Gerard F., Area Representative Real Estate, Canadian Pacific / Delaware & Hudson
Comment RR-2-2	The study should include an evaluation of options for using the West Shore bypass around Rochester, between CP 359 and CP 382.
Response	Your comments suggesting the evaluation of the use of the West Shore Bypass around Rochester, provides some valuable input. The alternative route you suggest may provide some relief for freight train operations on the main route through Rochester. Your comments have been considered in the review process and the selection of the Preferred Alternative. The Preferred Alternative will add additional trackage (third and fourth tracks) in this general area, but within the Empire Corridor, and the proposed designs will be further refined in the Tier 2 assessment.
Commenter	Edwards, Gerard F., Area Representative Real Estate, Canadian Pacific / Delaware & Hudson
Comment RR-2-3	The study should include an evaluation of the Lake Shore Route West of Buffalo, at least to Cleveland, Ohio, and possibly beyond.
Response	We appreciate your interest in reviewing the Tier 1 EIS for the High Speed Rail Empire Corridor Program, and the idea of extending the study to continue west on the Lake Shore Route west of Buffalo. Currently, the Tier 1 EIS focuses on the alternatives along Empire Corridor that were outlined in the document.

Commenter	Edwards, Gerard F., Area Representative Real Estate, Canadian Pacific / Delaware & Hudson
Comment RR-2-4	Finally- on Page 2-7, the second sentence in the 5th paragraph does not accurately represent field conditions.
Response	Thank you for reviewing the accuracy of the description of trackage in the Tier 1 EIS document. The text in the final sentence was revised and expanded in the Tier 1 FEIS as follows; "West of Rochester at MP 372.2, the Rochester Subdivision continues west with a straight alignment and fairly level topography, which permits 79 mph for passenger trains operating from MP 372.2 to MP 435.4 (within the Buffalo Terminal Subdivision). The eastern limits of Frontier Yard are accessed at CP 434, which also permits movement to the Belt Subdivision, the primary freight train by-pass around the City of Buffalo and the route to the International Railroad Bridge connecting to Ontario, Canada. Passenger train operating speeds, west of MP 435.4 on the Buffalo Terminal Subdivision, are limited to a speed of 60 mph near Frontier Yard and then to 30 mph at MP 436.8. At CP 437, approaching the Niagara Subdivision, the passenger trains increase their maximum operating speed to 60 mph, once they clear the interlocking at CP 437, and then follow the governing speed restrictions for this subdivision."
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-1	<p>On May 28, 2010, CSXT and the State of New York entered into a Framework Agreement "concerning any implementation of high speed intercity passenger rail service in New York." Framework Agreement ¶ 2. The Agreement expressly acknowledged that CSXT, and CSXT alone, has "sole discretion" to determine the "use of its property." Id., ¶ 5. Among other things, New York agreed that CSXT, as the owner of the right-of-way, has total and complete authority to determine what constitutes safe rail operations on its own property. The Agreement specifically recognized CSXT's safety guidelines for passenger trains operating on its property, and stated that "in all circumstances CSXT shall have the right to make the final determination as to safe uses of its property." Id.</p> <p>The Agreement provided that "[i]n all cases, and notwithstanding any other provision of this Framework Agreement, CSXT will abide by legal standards and maintain sole discretion with respect to the safety and use of its property." Id.</p> <p>The Agreement also recognized that CSXT, and CSXT alone, has the right—and the fiduciary responsibility to its shareholders—to determine whether a proposed passenger rail line would jeopardize its business. To that end, the Agreement provided that "CSXT and New York acknowledge that CSXT, as a wholly-owned subsidiary of a public corporation, has the responsibility to solely determine the freight capacity that CSXT must retain to accommodate future operations." Id., ¶ 6.</p> <p>With regard to potential liability arising from passenger operations on its property, the Agreement provided that "New York acknowledges that if the [Empire Corridor] Projects are implemented, CSXT will require adequate protections from potential liability arising from the operation of passenger rail service, consistent with law and precedent." Id., ¶ 7. Finally, the Agreement expressly recognized that New York must bear the massive cost of land acquisition, as well as the cost of any diminishment in value of CSXT's property rights. The Agreement stated: "New York acknowledges that it has a legal and constitutional obligation to justly compensate CSXT for any of its property rights acquired or used by New York, as well as for any diminishment in value of those rights to the extent permitted by law." Id., ¶ 8. The Agreement further recognized the considerable value of the property—and of CSXT's operations on the property. It provided: "New York acknowledges that the CSXT corridor that is the subject of this Framework Agreement is today the single busiest on the CSXT network and has tremendous opportunity for additional freight demand, including from the expansion of the Panama Canal. Accordingly, the property that would be</p>

impacted by the [Empire Corridor] Projects is among the most valuable freight corridors in the United States.” Id

Response New York State recognizes CSX Transportation’s role in supporting and participating in the High Speed Rail Empire Corridor Program, and their rights for determining the use of their property as outlined in the “Framework Agreement.” CSX Transportation is considered a leading partner in creating a vision for improved freight and passenger service in New York State. In moving the program forward New York State recognizes the valuable contribution that CSX Transportation offers both to the state and the nation’s freight railroad network. New York State shares with CSX Transportation the important goals of promoting economic revitalization along the Empire Corridor, and minimizing any impact to freight train operations from increased passenger train operations. Compared to Alternatives 110 and 125, Alternative 90B will involve lesser costs and impacts, with fewer property displacements, while also achieving the best on-time performance for Amtrak service in 2035 and the least delay-minutes per 100 train miles operated for freight trains. In 2035, Alternative 90B would also result in one of the lowest trip times for freight between Selkirk Yard, outside Albany, and Buffalo. In selecting Alternative 90B as the Preferred Alternative for the High Speed Rail Empire Corridor Program, the FRA and NYSDOT chose a program of improvements largely situated within the existing rights-of-way, thereby minimizing both costs and impacts. The Framework Agreement is discussed in the Executive Summary (Section ES-1) in Volume 1 of the FEIS. The agreement between New York State and CSX Transportation is also discussed in Chapter 1 – Section 1.1.3 and Appendix J.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-2 As currently presented, the 90 and 110 alternatives do not satisfy CSXT’s safety standards and are not safe uses of its property.

Response As noted in Chapter 3 of the Tier 1 FEIS, each of the Build Alternatives analyzed would be designed in compliance with design criteria found in American Railway Engineering and Maintenance-of-Way Association (AREMA) as well as Amtrak and CSXT design standards. In addition, implementation of safety measures such as Positive Train Control (PTC) will be included in the design and construction of each of the alternatives. It is also anticipated that crash energy management measurements will be included in the design criteria for each concept alignment.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-3 Alternative 90A is not acceptable from a safety perspective because it would increase the co-mingling of passenger and freight traffic on a busy shared track. The greater the amount of passenger and freight co-mingling on a shared track, the greater the risk of an accident.

Response Passenger and freight trains are currently comingled on CSXT’s right-of-way. The Preferred Alternative, Alternative 90B, will provide additional trackage to better segregate passenger rail and freight rail, thereby improving safety of rail transportation on the Empire Corridor. Approximately 370 miles of new track will include about 300 miles of third track in the Mohawk Valley, where CSXT freight operates west of Albany. The Preferred Alternative, Alternative 90B, includes all of the improvements included in Alternative 90A. NYSDOT maintains that Alternative 90A would not increase the risk of an accident due to the twenty separate capital improvement projects. The improvements proposed as part of Alternative 90A (and Alternative 90B) include improvements to the signaling system and Positive Train Control system, which would increase safety over existing conditions. As discussed in Section 3.3.2 of the Tier 1 FEIS, this alternative would increase the number of daily round trips between Albany and Buffalo by four trains from four to eight. Between New York City and Albany, a route with only four freight trains per day, Alternative 90A would add three daily round trips above the 16 existing trips.

Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-4	The scheme of crossovers, interlockings and grade crossings proposed in the DEIS will heighten the risk of an accident and will jeopardize the safety of passengers, train crews and the public. The DEIS offers no assurance that all of this can be accomplished safely.
Response	<p>NYSDOT remains committed to the safety of the travelling public and all users along the corridor. One of the Empire Corridor Program's objectives is to "minimize interference with freight rail operations."</p> <p>To achieve this, each of the Build Alternatives includes rail improvements projects currently planned and funded; these improvements would improve the service levels and operations as well as safety (see Tier 1 FEIS Section 3.3).</p> <p>Eight improvement projects would be included in all Build Alternatives with additional signal system improvements and grade separated flyovers included in certain Alternatives to eliminate potential conflicts with freight train movements. New interlockings, added crossovers, reconfigured signals, pocket tracks and new additional separate and elevated trackage in some Build Alternatives would further increase safety along the corridor.</p> <p>The Rail Network Operations Simulation study conducted as part of the Tier 1 DEIS (see Appendix D) concluded that there would be improvements to operating speeds and times for freight operations. It is further noted that the Tier 1 EIS concept alignments in all of the alternatives would be designed to comply with design criteria found in AREMA as well as Amtrak and CSXT design standards in Chapter 3, under the discussion of the Preferred Alternative (under "Safety").</p>
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-5	<p>With regard to Alternative 110, it is not clear whether the DEIS contemplates that the passenger trains will be operating in excess of 90 m.p.h. in locations where there is less than 30 feet of separation between the freight tracks and the passenger tracks. Compare DEIS at ES12-13 (stating that such tracks will have a speed limit of 90 m.p.h.) with DEIS App. A Drawing Nos. 110-7 through -10, -12, -14, -15 (depicting stretches of a second passenger track spaced 15 feet from the freight tracks and with the same speed limit of 91-110 m.p.h. as the first passenger track). If the DEIS does contemplate passenger trains exceeding 90 m.p.h. in these locations, that would present an unacceptable safety risk. There would not be adequate separation to protect against potential encroachment by maintenance crews, or the wind forces generated by passing high-speed trains. Moreover, in the event of a derailment, there would be a high risk of the derailed train obstructing an adjacent track. See Chen-Yu Lin & Mohd Rapik Saat, "Semi-Quantitative Risk Assessment of Adjacent Track Accidents on Shared-Use Rail Corridors" 4 & tbl. 2, 2014 Proceedings of the Joint Rail Conference (finding a higher likelihood of derailment obstructing the adjacent track at spacing of 15 to 30 feet than when tracks are 30 to 55 feet apart). The likelihood of an intrusion increases with train speed, given the amount of energy that must dissipate before a train stops. Id. at 6 & tbl. 7. And the denser the traffic on the corridor, the more likely that such an intrusion causes an accident. Id. at 7.</p>
Response	<p>It is not planned for trains in the 110 Alternative to operate in excess of 90 mph where the requirements, as outlined in the "Framework Agreement," require the 30-foot separation. In Section ES-3.2.4 under the heading Alternative 110, the following is stated: "Due to existing physical conditions that would make it impractical to achieve the 30-foot separation, there would be sections of third main track located 15 feet from the existing track. In these instances, the Maximum Authorized Speed would be reduced to 90 mph." Appendix A drawings are consistent with this statement.</p> <p>In accordance with FRA requirements, the tracks for the Preferred Alternative (Alternative 90B) must be maintained to meet Class 5 FRA Track Classifications (90 mph maximum speed limits for passenger tracks inclusive of civil curve restrictions). In order to reduce the risk of derailments and increase safety, countermeasures could be included that meet a</p>

higher standard for the FRA Class 6 track classification (up to 110 mph operation) to allow for an extra degree of protection. These countermeasures that could be undertaken to avoid or minimize derailments include increased weekly track, switch, and signal inspection frequencies concurrent with semi-annual ultrasonic rail testing of open track, turnouts, and crossovers, even on those rails within the transit track with track/traffic densities of less than 30 million gross tons annually.

These additional (Class 6) countermeasures could include annual automated track inspections, using the latest technology and best practices. Similarly, the adjacent CSXT tracks could be subject to the same type of condition assessment. Any exceedances above registered benchmarks would be recorded on the passenger track and also on the next adjoining CSXT track.

In addition, conditions assessments (typically required for Class 6) could be also be performed by scheduling bi-annual joint CSXT/Amtrak management level track and signal inspections. If conditions show degradation, the joint inspection with management and track inspectors can verify in the field degradation and slow order penalties can be assessed for exceedances of registered benchmarks to mandate corrective actions and needed repairs and enforce compliance status.

Another preventative measure for reducing the chance of derailments is rolling stock maintenance. Assessments of vehicle components, such as wheels, brakes, etc. will be an integral part of the maintenance program.

These countermeasures could be the subject of discussion among NYSDOT and CSXT during advanced design of the Preferred Alternative and incorporated into the MOU.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-6 On the other hand, if the DEIS does not contemplate passenger trains operating in excess of 90 m.p.h. in locations where there is less than 30 feet of separation, then its travel-time projections may not be accurate and may require adjustment. Because the DEIS does not clearly identify the parameters used in the operations simulation and the study itself is ambiguous, it is unclear how New York and the FRA have addressed this crucial issue.

Response The rail network operations simulation (Appendix D of the Tier 1 FEIS) conducted for Build Year 2035 accurately reflects the conceptual design and the terminus-to-terminus travel times account for areas of decreased maximum operating speeds due to limitations imposed by track geometry or civil constraints. The parameters used in the rail simulation are described in Section 2, Methodology in Appendix D, "Rail Network Operations Simulation." In developing the simulation model for the 110 Alternative, maximum authorized speeds (MAS) used were consistent with "Framework Agreement" (Appendix J). However, the Preferred Alternative is 90B, which has an MAS of 90 mph.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-7 Alternatives 90A, 90B and 110 are unacceptable for another reason: they will deny CSXT the capacity it needs to handle current and future traffic on the line, causing significant economic harm to upstate New York. In this context, capacity means the ability of CSXT to make full use of its own property in order to meet its common-carrier obligations now and in the future.

Capacity is a valuable and limited resource. Operating a passenger rail service on or next to CSXT's mainline would limit the number of train slots available for freight traffic. It would also prevent CSXT from using additional land within its right-of-way to accommodate increased volume in future years. This would be a particularly troubling development in light of the widespread recognition that demand for freight traffic is increasing and capacity will need to expand to meet this heightened demand. The U.S. Department of Transportation projects a 46 percent increase in rail freight between 2011 and 2040. See Freight Facts and Figures 2012 tbl. 2-1, <http://1.usa.gov/Qpp8js>; see also Ass'n of Am. Railroads, National Rail Freight Infrastructure Capacity and Investment Study (2007). CSXT

anticipates using additional land within its right-of-way to expand capacity and handle the increased traffic.

Response Development of the supporting Rail Network Simulations were a collaborative process with team members from NYSDOT, CSXT, LTK (who led this task); supported by Willard Keeney and HNTB. The CSXT staff from their offices in Jacksonville, Florida were participants in these simulation exercises and expressed no objection to the parameters employed in assigning track and slot capacity. Building the network simulation followed a joint effort that began in 2012 and continued through 2013, with the results of the simulations included in Appendix D of Volume 3 of the Tier 1 FEIS for the High Speed Rail Empire Corridor Program.

The network simulation identified sufficient capacity to operate both the future forecasted passenger and freight demand with the improvements proposed under each Build Alternative. CSXT provided a forecast for freight traffic and modeled CSXT dispatching practices in the deployment of freight and passenger trains to produce the travel time forecasts for Alternatives 90A, 90B (the Preferred Alternative) and 110 as discussed in the Tier 1 FEIS.

In 2011, the Baseline Simulation Report was advanced following receipt of review comments received from CSXT to reflect changes in train volumes and routing. The Amtrak Baseline Simulation OTP was recomputed based on CSXT model changes, giving Amtrak higher dispatching priority. Amtrak On-Time Performance was returned to CSXT for review. CSXT provided e-mail approval of the revised Baseline Simulation Model. This coordination with CSXT and their inputs is documented in Appendix D, "Rail Network Operations Simulation," Section 2.1.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-8 Of the many types of freight that move over the line today, intermodal traffic is the most service-sensitive. Approximately 20 intermodal trains use the line today, connecting the western and midwestern United States with New York City, New England, and the East Coast. Intermodal traffic will grow dramatically in the years ahead. To serve this increased demand, CSXT is developing a major new intermodal terminal near Montreal that will connect the Canadian markets with New York and other

Response The planning and design for all alternatives were coordinated with freight rail considerations. Baseline operations simulation as well as increases to service were obtained from CSXT. Facilitation of freight movement was identified as an element of purpose and need. Increases in freight traffic was included in the baseline modeling efforts. Localized controlled sidings, passenger bypasses, and dedicated freight/passenger track segments have been proposed to minimize congestion and minimize reduced speeds resulting from operations of freight and passenger trains on each alternative. Careful operations and dispatching will be required to minimize interferences accruing from increased demand from intermodal and passenger traffic. Intermodal freight would potentially benefit from the proposed addition of dedicated passenger and freight tracks. Intermodal traffic can be prioritized to minimize interference with time-sensitive movements. Other alternatives could be explored by developing a series of joint improvements both for station access and layouts and track/signal systems and alignment. In addition, operations and dispatching through off-peak use of the railway for freight traffic could be considered during later stages of the program.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-9 There are no comparable planning studies devoted to promoting economic growth through expanded passenger rail service.

Response	The economic benefits associated with expanded passenger rail service have been included in various studies, as discussed in DEIS Pages 1-12, 2-10, and 2-11.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-10	<p>Hundreds of New York businesses depend on access to the Empire Corridor and, through it, the national rail network. Examples of New York-based businesses that depend on CSXT include Eastman Kodak, Sunoco, ADM Milling, Bestway Distribution Services, Trigen Syracuse Energy Corporation, LiDestri Foods, Anheuser-Busch, and Gas Supply Resources Holdings.</p> <p>The CSXT network also connects to seven short-line railroad partners on the Empire Corridor: Depew, Lancaster & Western Railroad (interchanging at Batavia); Rochester & Southern Railroad (Rochester); Livonia, Avon & Lakeville Railroad (Genesee Junction); Ontario Midland Railroad (Newark); New York Susquehanna & Western Railway (Syracuse, Utica); Mohawk, Adirondack & Northern Railroad (Utica); and Finger Lakes Railway (Solvay). In 2012 alone, more than 30,000 shipments were moved to or from these partners. Because the CSXT network is a critical feeder—in some cases, the only feeder—to each of these railroads, any degradation in service on the CSXT mainline would not only threaten the many New York-based businesses that these short-lines serve, but also the competitiveness and viability of the short-lines themselves.</p>
Response	<p>The planning and design for all alternatives were coordinated with freight rail considerations. Base line operations simulation as well as increases to service were obtained from CSXT. Facilitation of freight movement was identified as an element of the program's purpose and need. Increases in freight traffic was included in the baseline modeling efforts.</p> <p>Localized controlled sidings, passenger bypasses and dedicated freight/passenger track segments have been proposed to minimize congestion and minimize reduced speeds resulting from operations of freight and passenger trains on each alternative. Careful operations and dispatching will be required to minimize interferences accruing from increased demand from intermodal and passenger traffic. Local, short-line freight would potentially benefit from the proposed addition of dedicated passenger and freight tracks and added crossovers, which would provide additional flexibility. Short-line freight traffic can be prioritized to minimize interference with time-sensitive movements. Other alternatives could be explored by developing a series of joint improvements both for station access and layouts and track/signal systems and alignment. In addition, operations and dispatching through off-peak use of the railway for freight traffic could be considered during later stages of the program.</p>
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-11	<p>Alternative 90A contemplates doubling the number of passenger trains on CSX's existing freight line. Because passenger trains are given dispatching priority over freight trains, the result would be delayed shipments and greater uncertainty for customers as to when a shipment will be picked up and when it will be delivered.</p> <p>Alternatives 90B and 110 would also have a severe and harmful impact on freight traffic. As explained in detail in the attached Declaration of Cressie Brown, "CSXT freight service cannot function at acceptable levels of reliability under Alternatives 90B and 110. . . . The core of the operational problem is that both alternatives propose numerous at-grade crossings to allow access to the many customers, switching facilities, branch lines, and short-line railroads that would be separated from the mainline freight tracks by the proposed passenger tracks. Dozens of times every day, freight traffic would have to wait unpredictable amounts of time for clearance from the passenger dispatcher to serve customers and reach yards. With narrow time windows for crossings, the inherent variability in freight service schedules, and a high volume of operations, freight service on the Empire Corridor would become gridlocked." Brown Decl. ¶¶ 8-10.</p>

Response	Alternative 90A includes many upgrades to the existing track structure and right-of-way to increase capacity and facilitate the movement of additional mixed freight and passenger traffic to meet the projected additional passenger and freight demand. Projections for freight trains under each of the Build Alternatives were conducted in cooperation with CSXT with data provided by CSXT. In Appendix D of the Tier 1 FEIS, the Rail Network Operations Simulation model identified sufficient capacity to operate both the future forecasted passenger and freight traffic provided the improvements outlined for each alternative are built. Similar to the simulation results for Alternative 90A, the simulation results for Alternatives 90B (the Preferred Alternative) and 110 used a CSXT-provided forecast for freight traffic and modeled CSXT dispatching practices in the deployment of freight and passenger trains to produce the travel time forecasts reported in the Tier I FEIS. As noted throughout Section 3.3 of the Tier 1 FEIS, final design will include a detailed evaluation of the need to construct additional crossovers, flyovers, and interlockings to allow freight trains running on the south side to crossover the new passenger mains to reach freight facilities on the north side.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-12	In the locations where they contemplate building a new, passenger-only track on CSXT's right-of-way, Alternatives 90B and 110 would create a physical barrier between CSXT and its customers on the north side of the track—a wall depriving well over 120 New York businesses of vital access to the national rail network. Maps and lists of those customers are attached to this Comment. The barrier would restrict future business growth in upstate New York by hampering companies interested in shipping their goods by rail. The expensive and complex process of building fly-overs—overpasses for passenger trains—is not a realistic alternative for a prospective new business, and would not even be physically possible in many locations.
Response	The new mainline tracks in Alternatives 90B (the Preferred Alternative) and 110 would be at-grade and include turnouts for freight trains to continue to access existing customers; this represents no change in access from the present day. Rather, the proposed additional turnouts and crossovers would provide greater operational flexibility than the simulation results in the Tier I FEIS demonstrates (see Appendix D). This will allow the corridor to handle the projected increases in both freight and passenger train volumes through 2035, while minimizing conflicts and reducing delays for both services. Localized controlled sidings, passenger bypasses, and dedicated freight/passenger track segments can be used to minimize congestion and reduced speeds resulting from operations of freight and passenger trains on each alternative. The proposed flyovers are a capital intensive, but effective infrastructure improvement that could be designed to reduce passenger/freight interference. The concepts for the three flyovers presented in this Tier 1 FEIS would be developed further in Tier 2 design. Other alternatives could be explored by developing a series of joint improvements both for station access and layouts and track/signal systems and alignment.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-13	New York explained in a recent filing with the Surface Transportation Board that the “success of NYSDOT’s policies and initiatives to reverse past disinvestment in rail infrastructure and build a thriving rail transportation system for New York, is dependent upon preserving and developing new rail sidings, rail-truck transfer facilities, yards and ‘lastmile’ connections serving terminals and shippers.”
Response	The Tier 1 FEIS is a part of NYSDOT’s efforts to reverse past divestment in rail infrastructure. Localized projects within the Tier 1 FEIS (Tier 2), including the implementation of localized controlled sidings, passenger bypasses, and dedicated

freight/passenger track segments, are proposed to minimize congestion and minimize reduced speeds resulting from operations of freight and passenger trains on each alternative.

This program will benefit both passenger and freight rail and represents a major capital investment in the rail infrastructure in the region.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-14 ¹The barrier [new passenger tracks on CSXT right-of-way under Alternatives 90B and 110] would also prevent maintenance crews from entering the right-of-way in their usual fashion—driving standard vehicles into the right-of-way from a crossing—and instead require them to use specially-equipped vehicles that can ride on the rails, further disrupting traffic because on many occasions, this special vehicle (a “hi-rail truck”) would have to stay on the rails, thereby rendering that track unusable for any trains during the entire duration of the maintenance event.

Response Nearly all modern railways use hi-rail vehicles to access and maintain track and facilities along the right-of-way. Similar to other rail lines, maintenance work would need to be scheduled off-peak/weekend so as not to interfere with passenger/freight traffic. The additional dedicated passenger track will not eliminate existing grade crossings, however, access and maintenance will need to proceed in a safe manner, consistent with similar railways.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-15 A state may not circumvent NEPA by following a tiered approach and deferring the necessary analysis to Tier 2 on the theory that it cannot determine environmental impacts at the Tier 1 stage.

Response FRA and NYSDOT have not circumvented the National Environmental Policy Act (NEPA). The agencies have followed NEPA and all appropriate regulations and procedures in preparing the Tier 1 EIS (including necessary analysis) for the Empire Corridor. Tiered environmental review is a well-established practice. The Council on Environmental Quality (CEQ) regulations encourage agencies to “tier their environmental impact statements to eliminate repetitive discussions of the same issues and to focus on the actual issues ripe for decision at each level of environmental review.” 40 CFR 1502.20; see also 1508.28. Section 8.g. of DOT Order 5610.1C further encourages tiered environmental documents for “complex transportation proposals.” The program area encompasses 464 miles of trackage along Empire Corridor and the Niagara Branch, spanning three different railroads (Metro-North Hudson Line, CSXT Empire Corridor West, and the Niagara Branch), connecting the largest metropolitan areas in the state (including New York City, Buffalo, Rochester, and Syracuse). The Tier 1 evaluation focused on concepts to be examined in more detail in Tier 2, ranging from minimal improvements (Base and Alternative 90A) to an exclusive sealed high-speed rail corridor (Alternative 125). Alternative 125 would involve construction of a total of 236 miles of double track on new corridor alignment along three different segments: Rensselaer to Syracuse, Syracuse to Rochester, and Rochester to Buffalo. Tier 2 would focus on the Preferred Alternative developed through Tier 1 EIS evaluations, which included an extensive agency consultation and public participation process

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-16 An Environmental Impact Statement issued by an agency of New York State must also satisfy SEQRA.

Response NYSDOT has determined that the Tier 1 EIS prepared for the Empire Corridor meets New York State Environmental Quality Review Act (SEQRA) requirements, as discussed on page 4-1 of the Chapter 4, Environmental Consequences of the Tier 1 Final EIS: “The Tier 1 EIS has been prepared in accordance with the National Environmental Policy Act of 1969

(NEPA) and its implementing regulations (40 Code of Federal Regulations [CFR] Parts 1500-1508); FRA's NEPA procedures (64 Federal Register [FR] 28545 and 78 FR Part 2713); and the New York State Environmental Quality Review Act (SEQR). NYSDOT, as the SEQR lead agency, has determined that the variance procedures under SEQR (17 NYCRR Part 15) apply."

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-17 If a passenger rail system is constructed on CSXT's right-of-way, there will be very harmful environmental consequences, as freight traffic shifts from the rails to the highways. The result will be more congestion on the roads, increased emissions of greenhouse gases by the armies of trucks necessary to carry the displaced freight, and less opportunity for environmentally- sensitive freight rail to grow in the years ahead. CSXT also has a strong interest in avoiding the increased environmental harms to its property—including noise, vibration and pollution—that would be caused by the additional passenger traffic.

Response The analysis in the Tier 1 FEIS shows that the program alternatives are neutral towards, or enhance freight operations, which includes CSXT-provided projections of future growth in freight traffic by 2035. Section 1.5 of the Tier 1 FEIS establishes six measurable performance objectives based on the program purpose and need. All alternatives were measured against these performance objectives, including the objective to minimize interference with freight rail operations and avoid degradation of freight service. Section 6.3 of the Tier 1 FEIS describes how the program alternatives affect freight train operations including delay, average speed, trip time and trip time variability. The Tier 1 FEIS determined that none of the Build Alternatives would negatively affect freight train travel times, and therefore no substantial shift of freight traffic from rails to highways would be expected to occur in the future with this program. The Tier 1 FEIS documents the effects of the program alternatives on noise and vibration (Section 4.21), greenhouse gas emissions (Section 4.20), and air quality (Section 4.19). Further studies of the noise, vibration and air quality will be conducted as part of the Tier 2 NEPA process. The net annual operational benefits (greenhouse gas emissions) for the Preferred Alternative would be roughly equivalent to eliminating the emissions associated with the energy and electricity consumption of 2,500 to 4,200 average U.S. single family homes every year. Due to the existing frequent service of both CSXT freight rail traffic and Metro-North commuter rail, the Preferred Alternative would not result in substantial (or even perceptible) increases in noise from train operations.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-18 The DEIS artificially constrains the range of build alternatives by limiting them to four variants of a passenger rail system constructed on or adjacent to CSXT's right-of-way.

Response The Tier 1 DEIS considers in detail a Base (No Action) Alternative and four Build Alternatives (90A, 90B, 110 and 125). As described in Section 3.2 and Appendix C of the Tier1 EIS, the screening of alternatives began with 10 preliminary alternatives. Using a consistent set of performance measures based on the purpose and need, FRA and NYSDOT considered and dismissed 5 preliminary alternatives. The lower speed alternatives (Alternative 79A, 79B, and 79C) are not appreciably different than Alternatives 90A and 90B in operations, costs, and environmental impacts. As a result, FRA and NYSDOT did not advance these alternatives for additional analysis. Very high speed alternatives (Alternatives 160 and 220) were dismissed due to high cost and environmental impacts. Alternatives 125, 160, and 220 would be located outside of the existing alignment. Very high speed alternatives (Alternatives 160 and 220) were dismissed due to high cost and environmental impacts. The very high-speed alternatives (160 and 220) require infrastructure for stations. New alignment on sealed corridor would require electrification of new track and would require a new Positive Train Control signal system. Moreover, high-speed rail on a new corridor would not improve freight capacity for CSXT operations,

when compared to the Base Alternative, since regional Empire Service would continue to operate on the existing Empire Corridor with the same service frequency to provide service to all existing stations. This was one of the performance measures used to evaluate prospective alternatives.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-19 The DEIS's examination of this artificially limited set of options rests on an arbitrary, inconsistent and incomplete methodology that fails to give decision makers an objective basis for fairly evaluating the various alternatives.

Response As described in Section 3.2 and Appendix C of the Tier 1 EIS, the screening of alternatives used a consistent set of performance measures based on the purpose and need. The lower speed alternatives (Alternative 79A, 79B, and 79C) are not appreciably different than the 90 Alternatives in operations, costs, and environmental impacts. As a result, FRA and NYSDOT did not advance these alternatives for additional analysis. Very high speed alternatives (Alternatives 160 and 220) were dismissed due to high cost and environmental impacts.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-20 Most notably, the DEIS fails to consider other options for transporting people across the region. The DEIS does not examine improved air or bus service as reasonable alternatives to high-speed passenger rail. Both of these modes of transportation are cost-effective ways of moving people around the region.

Response As stated in Section 1.3 of the Tier 1 EIS, the program purpose is to improve passenger rail service by increasing speeds, improving reliability, reducing travel times, increasing service frequency, and improving passenger amenities. Projects to improve bus or air travel do not improve rail service and therefore do not meet the Tier I EIS purpose and need. All reasonable alternatives that did meet the purpose have been considered. Bus and air markets were recognized in the travel demand forecasting and are documented in Appendix B and Appendix E of the Tier 1 FEIS.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-21 The DEIS improperly narrows the range of alternatives by artificially narrowing the project's Purpose and Need. Instead of defining the project need as, say, improving transportation options for New Yorkers along the Empire Corridor, the DEIS defines the project need as making passenger rail more desirable. See ES-5. By defining the project's purpose in this narrow and artificial way, the DEIS forecloses consideration of reasonable (and much more sensible) alternatives, such as improving air or bus transportation. Likewise, although New York has publicly stated that the DEIS "will position the state to get future high-speed rail funding from the federal government," qualifying for federal grant money is not a legitimate purpose and need.

Response As discussed in Sections 1.3 and 1.4 of the Tier 1 FEIS, and after a statewide scoping process for this Tier 1 EIS, the purpose of the High Speed Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and improve reliability, travel times, service frequency, and passenger amenities to improve intercity passenger rail travel. Projects to improve intercity bus or air travel do not meet the purpose and need. As presented in Chapters 1 and 2, the need for the program stems from historic growth (over the past 20 years) not only in Empire Service passenger rail traffic, but also freight movements and Metro-North commuter rail. Ridership on the Empire Service increased by more than 50 percent over a period of less than 20 years prior to 2019, and Metro-North commuter rail ridership increased by 45 percent over the previous 25 years. Both the U.S. Department of Transportation and the Association of American Railroads had forecast freight rail growth of at least 50 percent by 2035. Potentially qualifying for federal grant money is not stated in the Tier 1 EIS as a purpose and need for the program.

Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-22	Even accounting for the time required to travel to and from the airport and clear security, the 90-minute flying time from JFK to Buffalo makes the total trip duration less than half the roughly seven hours under Alternative 110. For the traveler putting time at a premium, the average one-way airfare of \$100, DEIS B-48, compares favorably with the \$58 one-way fare for existing Amtrak service, and even more favorably with the presumably higher fare for faster rail service. The DEIS does not explain why air transport alternatives were eliminated from consideration.
Response	As stated in Section 1.3 of the Tier 1 FEIS, the program purpose is to improve passenger rail service by increasing speeds, improving reliability, reducing travel times, increasing service frequency and improving passenger amenities. Air or bus improvement alternatives do not improve rail service and therefore do not meet the Tier I FEIS purpose and need. All reasonable alternatives that did meet the purpose have been considered. Bus and air markets were recognized in the travel demand forecasting and are documented in Section 2.5.4 and Appendices B and E of the Tier 1 FEIS.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-23	Likewise, bus service is widely regarded as a growing, environmentally-friendly, and cost-effective means of passenger transportation for trips of several hundred miles, with particular appeal to the most cost-sensitive passengers.
Response	As stated in Section 1.3 of the Tier 1 FEIS, the program purpose is to improve passenger rail service by increasing speeds, improving reliability, reducing travel times, increasing service frequency and improving passenger amenities. Air or bus improvement alternatives do not improve rail service and therefore do not meet the Tier I FEIS purpose and need. All reasonable alternatives that met the purpose have been considered. Bus and air markets were recognized in the travel demand forecasting and are documented in Section 2.5.4 and Appendices B and E of the Tier 1 FEIS.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-24	The DEIS does not explain why, if travelers prefer flying or driving because it is faster than the train, they would choose a “high-speed” rail alternative that is still slower than flying or driving. If there are reasonable alternative ways of transporting passengers along the Empire Corridor—as the DEIS concedes there are (see ES-5)—the government is required to consider those alternatives, or explain why they were eliminated from consideration.
Response	As stated in Section 1.3 of the Tier 1 FEIS, the program purpose is to improve passenger rail service by increasing speeds, improving reliability, reducing travel times, increasing service frequency and improving passenger amenities. Alternatives focused on automobile, air, or bus transport do not improve rail service and therefore do not meet the Tier 1 FEIS purpose and need. All reasonable alternatives that met the purpose have been considered. Bus and air markets were recognized in the travel demand forecasting and are documented in Section 2.5.4 and Appendices B and E of the Tier 1 FEIS. In addition, the ridership forecasts done for the Tier 1 FEIS demonstrate that people will ride the train even with the availability of other modes, such as auto, bus, and air. In part this is because train travel often brings a passenger closer to their final destination, often within walking distance, and avoids logistical issues such as parking constraints.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-25	Even if it were permissible under NEPA—and it is not—for the government to restrict the menu of alternatives to several high-speed passenger rail proposals, the DEIS should have analyzed other modes of transportation as part of the “No Build” alternative.
Response	Under NEPA and CEQ regulations (Section 1502.14), only reasonable alternatives need to be rigorously explored and evaluated. FRA/NYSOT is not required to include alternatives that do not meet the program’s purpose and need. The ridership forecast for these other modes are included in the Tier 1 FEIS and can be viewed in Appendix B. As presented in Chapters 1 and 2, the need for the program stems from historic growth (over the past 20 years) not only in Empire Service passenger rail traffic, but also freight movements and Metro-North commuter rail. Ridership on the Empire Service increased by more than 50 percent over a period of less than 20 years prior to 2019, and Metro-North commuter rail ridership increased by 50 percent over the previous 25 years. Both the U.S. Department of Transportation and the Association of American Railroads had forecast freight rail growth of at least 50 percent by 2035.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-26	The formulation of alternatives was arbitrary in another respect: the Empire Corridor South and the Empire Corridor West should have been considered as separate alternatives. By treating the Empire Corridor Program as a single indivisible project, the DEIS masks the weakness of the western portion (Buffalo to Albany) by relying on the relative strength of the southern portion (Albany to New York City).
Response	The High Speed Rail Empire Corridor Program is focused on improvements and goals for the entire corridor from New York City to Niagara Falls. In Chapter 3. - Alternatives, the Base and 4 Build Alternatives outline trip times and ridership for the entire corridor. The program references the two segments of Empire Corridor South and Empire Corridor West for the identification purposes for supporting projects and frequency of service. The organization of the program with the two segments, also allows for the focusing of improvements by the different host railroads along the route. Specific projects with independent utility will undergo the appropriate Tier 2 environmental review.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-27	There is no rational reason why (1) the proposal to create a high-speed passenger railroad on the Western Corridor and (2) the proposal to implement a slate of agreed- upon improvements on the Southern Corridor should be jammed together in a single Environmental Impact Statement. The nature of these proposals is very different and the two corridors themselves are very different—as New York has repeatedly recognized. The Western Corridor project and the Southern Corridor project should have been presented as separate alternatives. This would have given decision makers the option of endorsing the slate of improvements to the Southern Corridor (many of which make sense and are agreed upon by all stakeholders), while electing the “no build” alternative on the Western Corridor—an outcome that plainly constitutes a “reasonable alternative” under NEPA. The decision to lump both corridors together—using the public benefits of the Southern Corridor to justify investments in the Western Corridor—is arbitrary and limits the options of decision makers for no good reason.
Response	The High Speed Rail Empire Corridor Program is focused on improvements and goals for the entire corridor from New York City to Niagara Falls. The program’s purpose and needs pertain to the entire corridor with limits from New York City to Niagara Falls. As discussed in Sections 1.3 and 1.4, the purpose of the High Speed Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and improve reliability, travel times, service frequency, and passenger amenities. The program is being undertaken to meet the following needs: reduce infrastructure constraints and accommodate existing

and projected demand. Specific projects with independent utility will undergo the appropriate Tier 2 environmental review.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-28 First, the DEIS improperly postpones many critical assessments to the Tier 2 stage. An agency may not circumvent NEPA in this way. Courts have held that a tiered approach is permissible only where the government “performs the necessary depth of analysis” at the Tier 1 stage. *United States v. 162.20 Acres of Land*, 733 F.2d 377, 380- 81 (5th Cir. 1984). Because critical decisions that bind the government will be made at the Tier 1 stage, including the choice of a Preferred Alternative, the DEIS must fully address all issues that bear on those decisions and may not defer them to Tier 2. Here, there is no mystery surrounding the location and impacts of the 90 and 110 alternatives; they all require the use of CSXT’s existing right-of-way, where all aspects of the railroad and the adjacent environment are well known. There is no reason why the DEIS cannot address these issues in order to ensure an informed selection of a Preferred Alternative at the Tier 1 stage.

Response The alternatives considered include those that are both on and off of the existing CSXT right-of-way, and the level of information used for this comparison is the same for each alternative. This format is fully compliant with regulations and guidance concerning the use of Tier 1 NEPA documentation for major high-speed rail projects. The Tier 1 DEIS compares each of the program alternatives and their benefits, costs, and potential for environmental impact at a level of detail sufficient to permit reviewers to understand the choices and the scale of impacts likely for each. FRA and NYSDOT used this information, along with public input, to select a preferred alternative in the Tier 1 Final EIS, Alternative 90B. Section 1.1.3 of the Tier 1 FEIS addresses use, and compensation for use, of CSXT right-of-way: “The position taken by CSXT and agreed to by NYSDOT in the Agreements must be considered in the implementation of the Preferred Alternative chosen by NYSDOT and FRA on property owned by CSXT. One principle set forth in the Agreements is that CSXT is entitled to compensation for the use, acquisition, or diminishment in value of its property resulting from any project advanced as a result of the Tier 1 EIS. While the development of the cost of alternatives must and will include the recognition of this principle, the negotiation of the actual value of any compensation to CSXT is not part of this Tier 1 EIS, and will be developed if and when necessary as part of Tier 2 program advancement.” The Tier 1 DEIS did not artificially constrain the range of Build Alternatives. Alternative 125, which would not follow the CSXT right-of-way, was dismissed due to high cost and environmental impacts. Moreover, high-speed rail on a new corridor would not improve freight capacity for CSXT operations, when compared to the Base Alternative, since regional Empire Service would continue to operate on the existing Empire Corridor with the same service frequency to provide service to all existing stations. This was one of the performance measures used to evaluate prospective alternatives. Chapter 4 of the Tier 1 Final EIS and Appendix G presents the environmental analysis that supported selection of the Preferred Alternative. The Tier 1 DEIS and Tier 1 Final EIS considered the range of impacts in selecting Alternative 90B as the Preferred Alternative. Alternative 90B was selected based on lesser costs and impacts than both Alternative 110 and 125, while also meeting the performance metrics used to screen the alternatives (including improving freight travel times and passenger rail ridership and OTP). Due to the scale and scope of the program, Tier 1 examined the 464-mile long existing Empire Corridor/Niagara Branch Study Area for the 90 mph/110 mph alternatives at a conceptual level, identifying potential impacts to screen to a Preferred Alternative. It also evaluated the 450-mile long 125 mph Study Area. Although the conceptual environmental study identified “buffers” that could potentially be impacted at Tier 1, it would not be possible to examine in detail impacts of the entire range of alternatives evaluated in the Tier 1 program. More advanced design and environmental analysis would be required (appropriate for Tier 2) to fully characterize the extent, nature, and duration of impacts for this program, which spans the entire state. The concepts examined in the Tier 1 FEIS were

appropriate for this level of analysis, but Tier 2 analysis is necessary to fully comprehend the impacts of the Preferred Alternative.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-29 Second, the analysis of environmental impacts consists of generalized descriptive summaries instead of quantitative assessments. This is unhelpful to the decision maker because it does not allow apples-to-apples comparisons of the alternatives using a common metric. The DEIS also asserts that certain alternatives “support” or “strongly support” various performance objectives. See Chapter 6. But the DEIS does not disclose how it makes these gradations—that is, the point at which an alternative crosses the line from “support” to “strongly support.” Likewise, the DEIS compares alternatives with regard to whether they will have low, moderate or high adverse impacts in particular areas. See Exhibit 6-10. But the DEIS does not explain the thresholds for these determinations—and in some cases, more than one alternative is deemed to have the “highest” impact. Like much in the DEIS, these rankings appear to be arbitrary and subjective.

Response The Tier 1 FEIS clarified how environmental rankings were determined, the qualitative discussion in Section 6.4 provides the basis and substantiation for the rankings of environmental impacts presented in this chapter. The Tier 1 document quantified the potential impacts to resources to the appropriate level for this program assessment, as documented in Chapter 4 of the Tier 1 FEIS. This discussion included, as appropriate, quantitative comparisons on which to compare alternatives (e.g., number of waterway crossings for each alternative), but did not subjective numeric rankings. For instance, the acres within the study area for land uses, wetlands, floodplains, and farmlands are presented for each alternative. This is the appropriate level of assessment at Tier 1, until the proposed action is selected and the design concept fully developed. The relative rankings of low, medium, and high for environmental impact were based on these potential impacts as presented in Chapter 4, in each respective section. In general, alternatives that involved minimal right-of-way takings were deemed to involve low impact and those requiring entirely new right-of-way or additional right-of-way takings were deemed to involve medium to high impacts (depending on the relative extent of takings required). Similarly, the performance objectives present both quantitative and qualitative measures (e.g., OTP, travel time, frequency of service, ridership, etc.). The use of four gradations of ratings, from 'contrary to program goals,' to 'strongly supports program goals,' is intended to summarize the effectiveness of program alternatives in meeting the program performance objectives which are numeric values. In all cases where the 'strongly supports' gradation is used versus the 'supports' designation is used, the accompanying numeric values are clearly of a different magnitude. Exhibit 6-10 is a summary rating of the more-detailed environmental impacts information.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-30 Nor does the DEIS apply performance objectives consistently. For example, the DEIS identifies “minimize interference with freight rail operations” as a performance objective. See Appendix C. But the DEIS then rejects the 79 miles-per-hour alternatives because “their principal attribute . . . Is to provide greater reliability and fewer conflicts with existing and future CSXT freight movements along the Empire Corridor West.” See DEIS 3-8. That fact should have cut in favor of these alternatives, not against them.

Response As stated in Section 3.2.1 of the Tier 1 FEIS, the Alternatives 79A, 79B, and 79C were dismissed because they would be similar and slightly inferior to the Alternatives 90A and 90B. These alternatives were not advanced because, “None of the 79 mph alternatives provides a significant operational or cost advantage over the 90 mph alternatives. Because there was no substantive and positive differentiator of the 79 mph alternatives, they were not advanced for further consideration. In each case, the comparable 90 mph alternative

showed slightly superior trip time and ridership, resulting in it being retained over its slightly inferior 79 mph counterpart.”

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-31 Third, the DEIS compares alternatives by comparing cost estimates that the DEIS recognizes are not actually comparable. The DEIS recognizes that as the owner of the Western Corridor right-of-way, CSXT “is entitled to compensation for the use, acquisition, or diminishment in value of its property resulting from any project advanced as a result of the EIS.” DEIS 5-3 through 5-4. But the DEIS refuses to estimate that cost, which would indisputably increase the current “estimates” for Alternatives 90A, 90B, and 110 by billions of dollars given the value of the land and the enterprise value of CSXT’s current and future operations on that land. Omitting these costs makes it impossible to reasonably compare those options with Alternative 125, for which the DEIS does include land acquisition costs. The DEIS explains that the “development of the cost of alternatives must and will include the recognition of [the] principle” of compensation owed to CSXT. Id. At 5-4. But it attempts to mask the true costs of Alternatives 90A, 90B and 110 until Tier 2—after a Preferred Alternative has been chosen. In fact, the DEIS repeatedly presents the costs as if they are complete. See, e.g., id. At 3-42 Exhibit 3-17; 5-28 Exhibit 5-12. Worse, it repeatedly shows the costs side-by-side, without so much as a footnote alerting the public that the estimates are far from equivalent. See id. At ES-15 Exhibit ES-4; 5-15 Exhibit 5-1; 5-16 Exhibit 5-2; 5-22 Exhibit 5-7; 5-29 Exhibit 5-13.

Response NYSDOT has not obfuscated comparative costs. But, as noted in Section 5.2.1 in the “Property Acquisition” subsection, the Tier 1 FEIS recognizes the principle that while “CSXT is entitled to compensation for the use, acquisition, or diminishment in value of its property... the negotiation of the actual value of any compensation to CSXT is not part of this Tier 1 EIS.” That notwithstanding, the capital costs of the Tier 1 EIS are consistent throughout the alternatives including where property off of the existing right-of-way is required for construction, the costs were included in the capital costs. Similarly, the operations and maintenance costs, where an agreement with the host railroad would typically be captured, are consistent with the appropriate Passenger Rail Investment and Improvement Act (PRIIA) guidelines.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-32 Fourth, the operations modeling is flawed and undermines the DEIS’s rating system. As explained in detail in the attached Declaration of Mark A. Dingler: “By departing from standard practices for the integrity of simulations, by using inputs and parameters known to be inaccurate, and by failing to account for the real-world conditions under which a railroad operates, the document’s conclusions about both passenger and freight service are unreliable. Moreover, because of the lack of adequate documentation, it is impossible to know precisely what assumptions were and were not made.” Dingler Decl. ¶ 39. A scheme that makes sense on paper can fail spectacularly in the real world. In a plan with virtually no margin for error, a single small delay will cause a severe domino effect of delays and misplaced infrastructure and equipment across the entire system. This is particularly the case when the passenger tracks are laid out with the assumption that trains travelling in opposite directions utilize carefully-placed stretches of additional track. That technique of “flying meets” falls apart if either train is delayed. See D-54, D-58. And because the DEIS contemplates the freight and passenger lines crossing one another, any delay will affect both services.

Response The rail network simulations are discussed with supporting results in Appendix D (Volume 3) of the Tier 1 FEIS. Current and future movements of CSXT freight trains were included. Section 2 of the simulation modeling discusses the methodology for operating simulations. The results of the different scenarios are reported in Section 3 of the simulation modeling study. As shown in Exhibit 6-8, the Preferred Alternative, Alternative 90B, would result in

the least delay-minutes per 100 train miles operated for freight trains. The simulation modeling study is appropriate for a Tier I FEIS. In the development of the models of the Empire Corridor, FRA and NYSDOT provided CSX Transportation the opportunity to participate (as noted in Section 2.1 of Appendix D to the Tier 1 FEIS), CSXT provided comments on features and additional trackage that should be included in the model.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-33 Appendix A to this Comment examines ten other environmental impact statements prepared for similar high-speed passenger rail projects and demonstrates that the Empire Corridor DEIS is an outlier. In virtually every respect, the Empire Corridor DEIS is the only environmental impact statement in the group to provide such a superficial analysis of key issues. (FROM APPENDIX A)

1. Southeast High Speed Rail Tier 1 Final EIS, July 2002
2. Richmond to Hampton Roads Passenger Rail Project Tier 1 Final EIS, August 2012
3. Florida High Speed Rail: Tampa to Orlando Final EIS, May 2005
4. DesertXpress High-Speed Passenger Train Final EIS, March 2011
5. California High-Speed Train System Final Program Environmental ImpactReport/EIS, August 2005
6. Chicago to St. Louis High-Speed Rail Program Tier 1 Final EIS, October 2012
7. Chicago to Council Bluffs-Omaha Regional Passenger Rail System Planning Study Tier 1 Final EIS, May 2013
8. Milwaukee-Twin Cities High-Speed Rail Corridor Program Draft Final Alternatives Selection Report, October 2011
9. California High Speed Train Project Revised DEIR/Supplemental DEIS Fresno to Bakersfield, 2012 California High Speed Rail Train System Final Program EIR/EIS Merced to Fresno Section

Response In preparing this Tier 1 EIS, the referenced Tier 1 documents contained in the comment were reviewed. The Empire Corridor Tier EIS uses methods that are similar, if not identical, to many of the EIS documents referenced by the commenter. For example, the methods of screening alternatives, and establishing performance measures that address the program purpose and need, setting environmental buffers, and conducting environmental analyses in the Empire Corridor document closely matches other Tier 1 EIS's, such as the Chicago to Council Bluffs-Omaha Tier 1 FEIS and the Chicago to St. Louis High-Speed Rail Tier 1 FEIS. The Empire Corridor team engaged an Empire Project Advisory Committee (EPAC), similar to the Richmond/Hampton Road Tier 1 EIS technical working group, to vet alternatives, benefits, costs, and potential impacts. CSXT was an active participant on the Advisory Committee by formal invitation, and its concerns were considered in framing analysis methodologies, system simulation, and means of evaluating competing alternatives. CSXT was involved in the rail simulations, as documented in Appendix D. The Tier 1 Final EIS has incorporated additional discussion of the findings of the rail simulations in Chapter 3, "Alternatives."

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-34 Slowing and displacing freight traffic leads to increasingly congested highways and more pollution. That is because increased delays and uncertainty will cause businesses to ship their goods by truck rather than by rail.

Response The additional capacity of increased mainline track in Alternatives 90B and 110 along with professional dispatching will result in positive benefits to freight traffic by decreasing delays and uncertainty. Service is demonstrated to improve for both passenger and freight train operations as passenger interference is minimized. Chapter 3.3 of the Tier 1 FEIS documents the rail simulation results for each alternative in the "Freight Operations" discussions. Appendix D of the Tier 1 Final EIS presents additional details of the rail simulations.

Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-35	For these reasons, the Empire Corridor project will harm the environment by slowing freight rail operations and putting more trucks on the nation's highways. HDR Engineering, Inc. analyzed the public cost of CSXT freight traffic that would be displaced to highways if proposed high-speed intercity passenger rail were implemented on the CSXT mainline between Buffalo and Albany. That analysis, attached as Appendix E, concludes that the project would impose \$9.8 billion in public costs (using a 3 percent discount rate). These costs would include increased costs to shippers to purchase equivalent truck transportation instead of rail transportation. They would also include increased pavement maintenance costs, increased highway congestion costs, increased air emissions costs, and increased accident costs—all due to the diversion of freight from rail to truck.
Response	<p>The simulation of rail operations and the analysis of the potential impact of the program on freight operations demonstrate that the Preferred Alternative will have a positive effect on freight movements (see Exhibit 6-8). Therefore, the analysis completed for the Tier 1 FEIS shows that it is incorrect to state that the program will "...harm the environment by slowing freight rail operations and putting more trucks on the nation's highways." The Rail Network Operations Simulation (Appendix D) used information provided by CSXT for both current and future train movements. The Tier 1 FEIS used a freight traffic growth rate through 2035 provided by CSXT. Because the Preferred Alternative is forecasted to reduce both freight travel and decrease freight travel times, freight diversions (from train to truck) are not anticipated.</p> <p>In 2011, the Baseline Simulation Report was advanced following receipt of review comments received from CSXT to reflect changes in train volumes and routing. The Amtrak Baseline Simulation OTP was recomputed based on CSXT model changes, giving Amtrak higher dispatching priority. Amtrak On-Time Performance was returned to CSXT for review. CSXT provided e-mail approval of the revised Baseline Simulation Model. This coordination with CSXT and their inputs is documented in Appendix D, "Rail Network Operations Simulation," Section 2.1.</p>
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-36	The DEIS contains none of this analysis. See DEIS App. D. Its treatment of the harmful impact on freight traffic—and the resulting damage to the environment—falls far short of what NEPA requires. The possibility of freight traffic being diverted to the highways is "reasonably foreseeable," and would plainly have a significant impact on road conditions, energy use and air quality. Thus, NEPA requires that it be discussed in the DEIS.
Response	The Tier 1 EIS documents impacts to freight traffic, and the Preferred Alternative will not cause degradation of rail service even with the CSXT-provided growth in freight traffic through 2035, but will reduce freight delays and travel times, as documented in Section 6.3.2 and Exhibit 6-8 of the Tier 1 Final EIS and Appendix D. Therefore, it is reasonably anticipated that the program will not cause diversion of freight from rail to trucks. Consequently, adverse effects on air quality, energy usage, road traffic conditions, etc. due to freight diversion from train to truck are not expected.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-37	The DEIS's analysis of the impact on freight is far less detailed than the analysis conducted for other passenger-rail projects.
Response	The Tier 1 EIS documents the impacts to freight traffic from the Build Alternatives, and does not cause any degradation of freight rail service. Each passenger-rail program is unique, and the level of detail provided is sufficient for a Tier 1 EIS. The Preferred Alternative will provide the greatest reduction in freight delays of all of the Build Alternatives considered

and will also reduce freight travel times. With Alternative 90B, freight train delay-minutes would decrease the most among all alternatives, improving 10 percent over the Base Alternative and 6 percent over Alternative 110, the second best Build Alternative.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment
RR-3-38 The DEIS makes no attempt to model the enormous impact of twenty years of intensive construction on the freight corridor that would be necessary to implement the 90 or 110 alternatives. The effects of such a massive construction project are simply ignored—even though such an analysis is required by the FRA’s NEPA regulations. See 64 Fed. Reg. 28550. Large-scale construction on passenger tracks and associated infrastructure like signals would occur just a few feet away from the existing freight lines, requiring trains to slow as they pass through work zones. See generally 49 C.F.R. pt. 214. In fact, for Alternatives 90B and 110, the DEIS proposes shifting existing freight tracks, necessitating that traffic stops completely. See DEIS 3-39, 3-47 (discussing “large[] track shifts”). Yet it does not even acknowledge that disruption.

Response Section 4.25 of the Tier 1 EIS discusses construction means and methods and potential impacts and mitigation measures that would be employed under each of the alternatives. More design and construction details will be known as the program progresses and will be analyzed in the Tier 2 analysis.
The commenter inaccurately implies that page 3-39 and page 3-47 discuss the shifting of tracks during construction. Permanent, post construction track shifts would be constructed in segments to allow for the increase in operating speeds. Pages 3-39 and 3-47 of the Tier 1 DEIS discuss Alternative 90B and Alternative 110 alignments where several areas between Schenectady and Syracuse would require larger track shifts to obtain an increase in operating speeds due to the existing geometry of the track.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment
RR-3-39 With regard to Alternative 90A, which would run more passenger service on the existing freight lines, the DEIS fails to account for the fact that federal law would require almost all the tracks on the Western Corridor to be upgraded to support the proposed speed. As the DEIS correctly notes, most of the existing mainline track is currently maintained to FRA Class 4 standards, which limits freight traffic to 60 m.p.h. and passenger traffic to 80 m.p.h. See 2-20, -21; 49 C.F.R. § 213.9(a). Yet Alternative 90A contemplates service going as fast as 90 m.p.h. The DEIS does not acknowledge the disruption involved in upgrading the entire line to Class 5, much less the high cost of doing so. Nor does it address the direct cost of maintaining the track to that higher standard, which has significantly lower tolerances for deviations in track geometry, or the impact on operations on a congested corridor to accommodate that work. See generally American Railway Engineering and Maintenance Of Way Association, Practical Guide to Railway Engineering 3-47 through 3-54 (2003).

Response The Tier 1 EIS discussion of Alternative 90A recognizes the need to upgrade the existing tracks from Class 4 Standards to Class 5 Standards; Tier 1 FEIS Section 5.5 presents the understanding that improvements to existing infrastructure as part of Alternative 90A will be required. Section 5.5.1 acknowledges the potential adverse impacts to existing operations of constructing Alternatives 90A, 90B, and 110. Section 5.3.3 discusses CSXT involvement in the program development and also illustrates the FRA commitment to implementing the program so as to avoid adverse effects to CSXT freight operations. Specific and more detailed construction impacts and mitigation will be further defined in the Tier 2 analysis.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment
RR-3-40 The DEIS’s cost-benefit analysis is faulty; it substantially underestimates the project’s costs and substantially overestimates its benefits. HDR Engineering conducted a cost/benefit

analysis of the Empire Corridor project. That analysis is attached as Appendix D. HDR concluded that even under the “most favorable scenario,” the costs of the project exceed the benefits by approximately \$2.3 billion (using a 7 percent discount rate). The results for less favorable scenarios are worse.

Response The Cost-Benefit Analysis used for the High Speed Rail Empire Corridor is discussed in Section 5.2 and Appendix F (Capital, Operating and Maintenance Cost Estimating Methodology), and it is consistent with Amtrak’s accounting for, and determination of the operating and maintenance cost. In the future, and as appropriate, the Cost-Benefit Analysis for each of the individual supporting projects as part of the Tier 2 process will be consistent with the Federal Railroad Administration’s guidelines for Benefit-Cost Analysis Guidance for Rail Projects.

We have reviewed the HDR analysis, and these are our findings. Costs (capital and operating/maintenance) are presented in Exhibit 6-9 in the Tier 1 Final EIS, and means of funding the capital costs are addressed in Section 5.3. Subsidies noted are for operating cost vs. annual revenue as noted in the exhibit.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-41 First, in a section entitled “Market Qualities of Successful High-Speed Rail,” the DEIS identifies several factors necessary for a successful high-speed passenger rail system—but neglects to acknowledge that the Empire Corridor project fails to meet its own conditions for success. For example, the DEIS states that a “condition for successful [high-speed passenger rail service] is having the appropriate distance between stops,” and explains that “stops 250 miles apart” are ideal. DEIS B-7. But the DEIS then proposes a system in which the stations are only 31 miles apart on average, and only 35 miles apart on the Western Corridor portion. Likewise, the DEIS states that it is a “condition for successful” service that the cities served by a high-speed rail line have “existing transit systems,” and deems it “critical” that there be population density around a station. DEIS B-8, B-9, B-27. But the DEIS then concedes that the “populations that make up each major market on the [Western] corridor” are “heavily dispersed.” Id. At B-97. Even using the DEIS’s own density benchmark of 4,000 people per square mile, only Rochester and Buffalo have the requisite density to support high-speed passenger rail.

The DEIS repeatedly acknowledges that almost all of the proposed station stops on the Western Corridor lack the requisite population density, the requisite transit connections, or both

Response The Empire Corridor across New York State is one of the oldest continually operated passenger trains routes in the United States. The purpose of the High Speed Rail Empire Corridor Program is to reduce trip times and increase the service. The Tier 1 EIS in describing the conditions for successful high speed rail service, builds from the concepts of offering services at different levels to support the communities along the route. Stations along the Empire Corridor are part of the historical development of passenger service. On the route, there are already significant distances between stations with a span of 61 miles between Buffalo-Depew and Rochester and 80 miles between Syracuse and Rochester, these distances are consistent with some of the stations along the Northeast Corridor, which also features high-speed train service. It also needs to be recognized that along the Empire Corridor that the stations are regional resources, with many of the passengers driving to these stations to use the intercity rail service. Station spacing along the Empire Corridor are consistent with the availability for passengers to other modes of transportation.

Ridership and Revenue projections and estimates are discussed in both Volume 1 and Appendix B, and include the criteria that will help the different alternatives achieve the program goals. There are several criteria that would make a high speed corridor program viable including serving cities with existing transit systems. The Empire Corridor program

serves the most populous and densely populated cities in the state including New York, Albany, Syracuse, Rochester, and Buffalo.

Both the FRA and NYSDOT believe that there are no discrepancies in the methodology and findings of the ridership and revenue forecasting that is used in Volume 1 and Appendix B. All of the cities along the Empire Corridor are served by transit systems, and many include feeder route that extend beyond the city to their suburban communities.

Exhibit 3-1 presents the FRA levels of high-speed rail service, and the Emerging category (speeds up to 90 mph) has routes between 100 to 500 miles while the next level up, Regional (90 mph-125 mph), has routes up to 500 miles apart. The 250-mile separation would be more appropriate for very high-speed rail in a less densely populated area. The existing Empire Corridor service has existing station stops that serve the largest cities in the states along the route, and the service to these cities would contribute to the ridership potential for the service, making the service more viable. The remainder of this section in Appendix B cites conditions for successful high-speed rail service: (1) locating service in metropolitan areas with transit systems and (2) locating service in metropolitan areas with strong Gross Domestic Product. The existing Empire Service servicing city centers in New York City, Buffalo, Rochester, Utica, Syracuse meets these conditions for successful high-speed rail service, but this requires station stops less than 250 miles apart. The Northeast Corridor (current Acela schedules) make stops more frequently than 250 miles and Acela is considered a successful high-speed service. Population centers in the northeast are routinely much closer than 250 miles with service to reflect the population centers.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-42 The DEIS recognizes that high-speed passenger rail works best in “regions with high congestion levels,” such as in the Northeast Corridor where I-95 is often backed up, making travel by automobile or bus difficult and unpredictable. But the DEIS then concedes that the Western Corridor is not plagued by congestion, acknowledging that the “presence of an uncongested Thruway . . . provides quick auto trips between [cities] on this sub-corridor and quickly connects auto users from the origin to their destination.” B-97

Response As discussed in ES-2.2 and Chapter 1 of the Tier 1 EIS, the purpose of the High Speed Rail Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and to improve reliability, travel times, service frequency and passenger amenities. Relieving congestion levels in the corridor would be a benefit of the program but is not the purpose or identified as one of the needs for the program. The Empire Corridor program would provide benefits throughout the corridor including providing better reliability, travel times, service frequency and passenger amenities. The corridor has been identified in three segments because each have of the unique operating characteristics of each. However, the program is anticipated to provide benefits for travelers between on the entire corridor from New York City to Niagara Falls.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-43 The DEIS also fails to acknowledge that regional planning studies do not endorse the idea of high-speed rail along the Empire Corridor. While there are many community planning studies addressing how to restore and grow the region’s economy, none identifies high-speed passenger rail as the solution. To the contrary, these studies conclude that tax dollars should be spent on attracting businesses, renovating declining neighborhoods and investing in schools (to name just a few examples). No planning study recommends prioritizing high-speed passenger rail above these and many other compelling public needs. In fact, although the DEIS notes that there have been many federal, state and local planning groups that have studied the feasibility of high-speed passenger rail—and how it might fit into overall regional planning efforts—the DEIS does not integrate or even meaningfully engage these studies and their conclusions.

Response	<p>Section 4.2 and Appendix G, Section 1 of the Tier 1 FEIS cites more than 20 state, regional, and local plans, many of which indicate support for improved access to rail service including improvements to the rail corridor, strengthened alternative modes of transportation, improved on-time performance, introduction of high- and higher-speed rail, and revitalization of station areas. The plans cited for program consistency include: New York State Rail Plan, NYSDOT Multimodal Transportation Program submission: 2009-2014 (March 20) as well as 26 county and municipal plans. The program is also consistent with the New York State Smart Growth Public Infrastructure Policy Act, as addressed in Section 4.2 and Appendix G.1. The U.S. Conference of Mayor's report addressed the substantial economic benefits that would accrue with implementation of high-speed rail service to the Albany region. This report projects that incremental speed improvements (79 to 90 mph) and more frequent service (32 roundtrips from NYC to Albany) could result in an addition of approximately 3,184 jobs in 2035 in the Capital District/Albany region alone. This report also forecasts increases in 2035 of sales output in the Capital District alone of \$357.9 million per year and increases in 2035 wages of \$158.7 million per year.</p> <p>The Build Alternatives advanced for analysis in the Tier 1 DEIS meet the program's primary needs: to reduce infrastructure constraints and accommodate existing and projected (ridership) demand.</p> <p>Contributing to "economic revitalization by accommodating forecasted growth in population and employment and corridor rail freight operations" is one of the program's transportation-related goals and supports the program's purpose and need of accommodating existing and future demand. Growing the region's economy in general and in a non-transportation manner is not a program objective and is beyond the scope of this program and review.</p>
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-44	Nor does the DEIS acknowledge that the 90 Alternatives do not even qualify as "high speed" rail as Congress defines it.
Response	The Federal Railroad Administration's High Speed Intercity Passenger (HSIPR) Program outlines a 3-Tiered Strategy for Passenger Rail, that would include the 4 Build Alternatives (90A, 90B, 110 and 125). https://www.fra.dot.gov/Page/P0134
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-45	Another disturbing omission is the DEIS's failure to reconcile its ridership projections with the dramatically different projections in the 2006 study by the state Senate Task Force. The Senate study projected that traffic between the New York City area and points on the Western Corridor would constitute only 5 percent of all new ridership for a high-speed passenger rail line similar to Alternative 110. The DEIS, however, concludes that traffic between the New York City area and points on the Western Corridor will constitute 65 percent of the new ridership for Alternative 110. See DEIS App. B. The DEIS offers no explanation for this disparity. At a minimum, New York must explain why it chose to ignore the Senate Report and why it reached such a dramatically different conclusion.
Response	<p>The Tier 1 EIS for the High Speed Rail Empire Corridor Program actually projects lower ridership for the three of the four Build Alternatives, representing a more conservative estimate. The projected ridership in 2035 is: 2.3 million for Alternative 90A, 2.6 million for the Alternative 90B; 2.8 million for the 110 Alternative; and 4.3 million riders for Alternative 125.</p> <p>Section 3 of The New York State Senate High Speed Rail Task Force Report (2006), discuss ridership growth with the various alternatives with projected ridership growth to 2025, it is discussed in greater detail in Section 3.1.6 (page 3-9) of that document with a possible ridership of 3,946,000 in 2025 for Alternative E.</p> <p>Since 2001, ridership on the Buffalo to Albany-Rensselaer portion of Empire Corridor has more than doubled. Although comprising a substantially smaller proportion of overall</p>

ridership on Empire Corridor, Empire Corridor West has the highest growth rate (as a percentage) on the corridor. It experienced a proportionally larger growth rate than the New York City to Albany segment. The New York State Senate Task Force Report echoes this conclusion with ridership increases projected along Empire Corridor West. The report states: “The most dramatic ridership increases in percentage terms occur in the west corridor, where current ridership today is low relative to the south corridor.” The report states that Empire Corridor West was found to represent 16 percent of the total ridership and 56 percent of the total projected growth (for Case D-New Operations Plan), with an increase of ridership growth along Empire Corridor West of 316%. Appendix B of the Tier 1 EIS states: “Long Trips on the Empire Corridor – or trips that connect pairs such as NYC to Buffalo, NYC to Rochester, and NYC to Syracuse – account for about 60 percent of all growth forecast in all of the build alternative speeds studied.” This is roughly consistent with the 56 percent growth projected for Case D of the NYS Senate HSR Task Force report.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-46 Second, the DEIS overestimates benefits by basing projected ridership numbers on an inflated estimate of the region’s population in the years ahead. Although the DEIS states that a goal of the project is to “[c]ontribute to economic revitalization by accommodating forecasted growth in population,” ES-6, the DEIS acknowledges that its own estimates show “a slight population decrease in many of the counties” on the Western Corridor by 2035. See DEIS 2-10, 2-11 (emphasis added).

Response The projected population and employment for the Empire Corridor’s nine MPO regions are based upon the U.S. Census 2010 data. The Ridership and Revenue Forecasting Study indicates that an improved rail service, in terms of improved travel time, frequency of service, and reliability, will offer more travel choices (a program goal) with a target to attract passengers from their automobile, contributing to improved air quality and other environmental benefits. Appendix B of the Tier 1 FEIS explains that most of the new ridership along the Empire Corridor will be based on traveling to New York City, due in part to the ease of train travel to NYC vs. other modes. Train travel often brings a passenger closer to their final destination, often within walking distance, and avoids logistical issues such as parking constraints, which are particularly challenging in NYC. It is also anticipated that improved service on the western portion of the Empire Corridor will create new travel opportunities, supporting a program goal to increase travel choices.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-47 Moreover, the DEIS’s population estimates are unreliable. They are overoptimistic and deviate substantially from the population estimates prepared by the state-funded (and Census Bureau-affiliated) Cornell Program on Applied Demographics. For example, the Cornell Program estimates that by 2035 the Western Corridor will lose more than three times the population that the DEIS projects. Similarly, when the Western Corridor and Southern Corridors are taken together, the DEIS projects approximately six times the population growth that Cornell projects.

Response The reference cited by the commenter does not forecast population estimates; it uses only historic data and continues the rate of change in population for the future. Section 4.3 of the Tier 1 EIS discusses the methodology used to identify future population in the nine MPO areas, eight Metropolitan Statistical Areas and population statistics for 25 counties in the Empire Corridor obtained from the 2010 U.S. Census Decennial Census.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-48 The DEIS does not identify how much it will cost to purchase or lease the land, and does not explain how New York expects to pay for it, even though the Framework Agreement expressly recognized New York’s obligation to pay CSXT the cost of land acquisition or use. Third, the DEIS massively underestimates the project’s costs. Although the DEIS specifically

notes the immense cost of land acquisition for the 125 option, it largely sidesteps this issue with regard to the other build options (Alternatives 90A, 90B and 110). CSXT owns hundreds of miles of the right-of-way on which the proposed passenger service will operate. That property is a key segment of CSXT's line from Chicago to the New York-area ports, a right-of-way stretching across six states with a value in the billions.

Response The Tier 1 DEIS addresses broad corridor-level issues. Subsequent phases, or tiers, will analyze in greater detail site-specific proposals based on the decisions made in Tier 1. As stated on Pages 5-3 and 5-4, the Tier 1 DEIS recognizes the principle that "CSXT is entitled to compensation for the use, acquisition, or diminishment in value of its property..." The cost of compensation for use of CSXT right-of-way cannot be determined at this time and will be subject to future negotiations.

Program costs are presented in Chapters 3 and 6 for all of the Build Alternatives. The Tier 1 Final EIS cost estimates did not include the cost for compensating CSXT for the use of the right-of-way. However, the 90 and 110 Alternatives accounted for significant property acquisition within the cost estimates. In estimating the cost of land acquisition, five distinct categories of land acquisition types were developed – prime city, town, suburban, farmland, and marsh. Each land category was assigned a unique per acre dollar value. With regards to building acquisitions, three distinct categories were developed – business, residence, and outbuilding. The values were assigned using square foot (SF) of building size.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-49 "Presenting accurate market demand information [is] necessary to ensure a well informed and reasoned decision, both of which are procedural requirements under NEPA." By relying on population and employment numbers that are not accurate—and by neglecting to acknowledge that the Empire Corridor project does not meet its own requirements for a successful high-speed rail program—the DEIS's assessment of market demand is deficient.

Response The population and employment statistics presented in the Tier 1 EIS were obtained from the U.S. Census Bureau and the U.S. Bureau of Economic Analysis. According to the 2019 U.S. Census, New York's six largest metropolitan areas (New York City, Buffalo, Rochester, Yonkers, Syracuse, Albany) lie along this corridor. New York City is the nation's largest economic center, and is one of the three largest economic centers in the world, along with London and Tokyo.

Appendix B presents the results of the "Ridership and Revenue Forecasting," that formed the basis for estimating market demand for the Empire Corridor Program. Within this report, Appendix A presents a review of the modeling methodology. This effort included a comprehensive literature review, including review of other statewide transportation models, to devise an intercity multimodal travel demand forecasting model. Modeling also considered methods used for the California statewide High-Speed Rail forecasting, as well as that used for the Northeast Corridor Model.

The program's model included examining market pairs for cities, including nearby cities outside the state, such as Boston and Washington. The modeling effort included examination of other modes (highway, air travel, bus), in addition to intercity passenger rail. The forecasted populations and employment were the basis for the growth factored into forecasted travel demand. The model included an origin-destination analysis that also used a statewide average daily demand matrix and corridor annual vehicle traffic (based on toll data for the New York State Thruway). The Empire Corridor Intercity Travel Demand Model was successfully calibrated to match the observed travel data.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-50 The FRA has deemed the compensation question sufficiently critical that it will not provide federal funding for high-speed rail projects on a freight railroad's right-of-way until this question has been resolved.

Response	Applicable federal laws require that, as a condition of receiving a grant for projects that use a railroad owner's right of way, the grant recipient shall have in place an agreement addressing its shared use by the parties. As program elements of the Empire Corridor Program advances to the grant agreement stage, the Department will fully comply with this provision of the Federal Register/Vol. 74, No. 119 Appendix 3.4.3.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-51	A decisionmaker cannot compare the true costs of the build options absent an analysis of the cost of land acquisition or other compensation that must be paid to the property owner for the use of its land. The selection of a Preferred Alternative in the absence of such critical information would be arbitrary and capricious.
Response	Program costs are presented in Chapters 3 and 6 for all of the Build Alternatives. The Tier 1 Final EIS cost estimates did not include the cost for compensating CSXT for the use of the right-of-way. The cost of compensating use of CSXT right-of-way will need to account for factors that include current operations and OTP performance/operational delays. However, property acquisition costs have been accounted for in the cost estimates of the Build Alternatives. In estimating the cost of land acquisition, five distinct categories of land acquisition types were developed – prime city, town, suburban, farmland, and marsh. Each land category was assigned a unique per acre dollar value. With regards to building acquisitions, three distinct categories were developed – business, residence, and outbuilding. The values were assigned using square foot (SF) of building size.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-52	The DEIS ignores many other costs, including the cost of compensating the owners of industrial parcels on the far side of the passenger tracks, and on the northward- connecting branches and regional lines, for the diminishment in their property value caused by the loss of rail access. And for Alternatives 90A, 90B and 110, the DEIS fails to adequately account for operational costs, including the significant costs of upgrading the circuitry that controls warning systems at sidings and grade crossings.
Response	All customer access is maintained in the current conceptual track layouts, so no loss was estimated for diminishment of property value. The operational costs are included in the cost estimates. It is noted in Sections 3.3.3 and 3.3.4 that a new signal system and grade crossing modifications are major elements in the additional infrastructure required for Alternatives 90B and 110, respectively. Costs for the signal system, warning systems, public and private grade crossings, and PTC upgrades are included.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-53	The DEIS fails to take a hard look at noise and vibration impacts. In fact, the DEIS fails to follow the steps set forth in the FRA's noise manual, despite claiming to follow that methodology. DEIS 4-238. Curiously, the DEIS relies on the 1998 version of the FRA's manual, see DEIS 4-238 n.170, even though the manual was updated in 2005 and again in 2012. The current version of the FRA noise manual states: "[I]n view of the sensitivity of the noise criteria to the existing noise exposure, careful characterization of the existing noise is important." FRA Manual for High-Speed Ground Transportation Noise and Vibration Impact Assessment 3-9 (2012). And when the project "is to be shared with an existing rail transit corridor . . . Noise measurements at representative locations along the corridor are essential to estimate existing noise accurately." Id. At 4-13 (emphasis added). The DEIS does not do any of this. It also omits any discussion of noise impact during construction, as required by federal regulations. See 64 Fed. Reg. 28556.
Response	Thank you for pointing out this apparent oversight. The reference to the 1998 version of FRA Manual is corrected to reflect the use of the 2012 version. The reference does not affect

the analysis or change the conclusions of the Tier 1 FEIS. For the General Noise Assessment used in the Tier 1 FEIS, noise measurements are not required to estimate existing levels. According to the FTA/FRA guidance, existing noise levels were estimated based on the noise exposure values in Table 5-7 of the FTA Manual. This method of assessment is appropriate for a 400-plus-mile corridor in a Tier 1 FEIS. As appropriate for this point in the program development, the Tier 1 FEIS states that there is the potential for severe noise impacts throughout the program area. NYSDOT will conduct a detailed noise analysis, including a comprehensive noise measurement program, for the Tier 2 analysis. This analysis would require further engineering and operational analysis along with site-specific land use data throughout the corridor. Similarly, without detailed engineering design to develop detailed construction phasing, staging and equipment usage by location, a construction noise impact analysis cannot be conducted at this time.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-54 The DEIS fails to tabulate impacted buildings, another required step. Part of the General Noise Assessment is a “Noise Impact Inventory,” which requires the assessor to “tabulate buildings and sites that lie within” previously mapped “impact contours,” and to “[p]repare summary tables showing the number of buildings and dwelling units within each impact zone for each alternative.” FRA Noise Manual at 4-17. The DEIS notes simply that “there were noise sensitive receptors within” the area that might be affected, providing no detail as to their location, type, or quantity. DEIS 4-240. It then states that “a detailed noise assessment is necessary to determine whether noise levels would exceed the applicable impact criteria.” Id. At 4-248. This approach contradicts the FRA and New York’s promise that the DEIS would “[a]ssess locations where the change in noise levels would result in severe, moderate, or no impact.” Tier 1 EIS Environmental Impact Assessment Methodologies 28 (2011).

Response Section 4.21 (Noise and Vibration) of the Tier 1 EIS correctly follows the steps described in FRA’s high-Speed Ground Transportation Noise and Vibration Impact Assessment and the program’s Environmental Impact Assessment Methodologies (2011). Chapter 4 of the FRA Manual contains procedures of an initial evaluation of potential noise impacts from a high-speed rail project. “The goals of an initial noise evaluation are to identify the potential for impacts and to determine their order of magnitude so that a more detailed analysis can be done in areas where significant impacts are found during later phases of the design process. [Emphasis added.] The Manual further states that a General Assessment be conducted in the early planning stage to help establish most promising corridor locations. Any estimate of the number of buildings impacted would require detailed information that is not available at this conceptual level of design. Tier 2 analyses would include a more detailed analysis including the number of receptors that would experience impacts from the Build Alternatives. Exhibit 4-32 of the Tier 1 FEIS summarizes the potential impacts to each of the ten segments of the Empire Corridor. As shown in Exhibit 4-32 and Section 4.21.4 of the Tier 1 FEIS, five segments of the corridor are anticipated to experience severe impacts and a sixth segment would experience moderate impacts. Four segments would experience reductions in noise levels.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-55 Nor does the DEIS include the required preliminary assessment of what noise mitigation would be effective. “The final step of the General Assessment is to estimate the noise mitigation measures required to minimize the number of impacts.” FRA Noise Manual at 4-18. The Manual provides procedures for making “order-of-magnitude” estimates of the height of barriers that would be sufficient to mitigate noise, and to estimate the cost involved. Id. At 4-19. The FRA and New York had previously said that they would “[e]xamine the feasibility of potential mitigation measures” during Tier 1. See Tier 1 EIS Environmental Impact Assessment Methodologies 28. However, the DEIS simply offers a

laundry list of possible mitigation approaches and then defers the feasibility analysis to Tier 2. DEIS 4-249.

Response Section 4.21.5 of the Tier 1 FEIS discusses three different types of mitigation options: noise source mitigation measures; path control mitigation measures; and receptor control measures. Several measures in each of the categories are also provided as potential measures that would be investigated in Tier 2 analysis, as needed and appropriate.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-56 There must be adequate separation—at least 30 feet, measured from track center to track center—between the track used for freight service and the track used for passenger service exceeding 90 m.p.h. This will account for the risk posed by the wind forces generated by passing high-speed trains, as well as by the dust, debris and ice that may be dislodged by a passing train. It also accounts for potential encroachment by maintenance crews. The FRA has emphasized the need for adequate separation, deeming it a “critical” issue requiring careful consideration. FRA, High-Speed Passenger Rail Safety Strategy 13 (2009). And a recent FRA Technical Report stated that “while having track centers less than 25 feet [apart] may have been acceptable for past transit lines” running at lower speeds on shared right-of-ways, “operating high-speed trains on adjacent tracks may be unacceptable” today. FRA, Investigating Technical Challenges and Research Needs Related to Shared Corridors for High-Speed Passenger and Railroad Freight Operations 13 (2013).

Response There is no industry standard or design criterion that declares 30 feet of separation between 110 mph passenger and lower-speed freight tracks as either adequate or inadequate. Moreover, passenger and freight trains traveling in opposite directions at speeds approaching 160 mph for passenger trains are comingled on the Northeast Corridor (NEC) with track centers nearing 15 feet in many locations. The FRA document acknowledges examples of existing light rail transit vehicles and freight trains comingled or at closer than 30 feet track centers without commenting on the 30’ separation as a requirement. Since a distance of 30 feet was recommended by CSXT for passenger trains traveling in speeds in excess of 90 mph, the conceptual alignment of Alternative 110 strives to meet this recommendation.

FRA, Vision for High-Speed Passenger Rail in America (2009), Page 8, states that “the advent of Positive Train Control (PTC), crash energy management, and other advances provides the United States with an opportunity to revise its safety approach in a manner that accelerates the development of high-speed rail...” There is no suggestion in the commenter’s cited reference that 25 or 30 feet is or is not acceptable; the reference only refers the matter for future study.

In addition, page 26 of the report, “Investigating Technical Challenges and Research Needs Related to Shared Corridors for High-Speed Passenger and Railroad Freight Operations (2013)” states that “CSX meanwhile has only agreed to 90 mph passenger trains on the Empire Corridor from New York to Buffalo,” with no track center mentioned.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-57 There must be adequate grade separation and warning mechanisms at all public and private grade crossings. There are almost 200 such crossings on the Western Corridor. See DEIS 2-346. The grade separation must satisfy the standards established by the FRA. See Office of Railroad Safety, Highway- Rail Grade Crossing Guidelines for High-Speed Rail (Nov. 2009). Alternatives 90A, 90B and 110 present complex technical challenges to ensure properly functioning warning systems. The DEIS does not discuss those challenges, or the legal issues surrounding private, at-grade crossings.

Response Section 3.4.4 of Appendix E of the Tier 1 FEIS discusses the both the public and private grade crossings in the different sections of the Empire Corridor and recognizes that that current private crossings are equipped with “passive warning systems.” The importance of

safe railroad operation is recognized and discussed in Section 2.6 of the Tier 1 FEIS. FRA/NYS DOT recognizes that more detailed study and design, as necessary, is required in the Tier 1 FEIS for each at-grade crossing that remains in each of the Build Alternatives. The analysis is anticipated to include whether these at-grade crossings would be either enhanced or eliminated, depending on the final design speed and be consistent with the FRA's regulations and guidance.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-58 Fences with detection circuits may need to be installed to provide early warnings of derailments. In addition, access control fencing must be installed in areas where there could be pedestrians or trespassers.

Response All feasible safety measure including those cited by the commenter will be considered, if appropriate as the design stages progress and will be analyzed in the Tier 2 analysis. The Tier 1 FEIS addresses fencing and other safety features for the Preferred Alternative in Section 3.3.3, under the "Safety" section. The Tier 1 FEIS accounts for several types of fencing and warning systems:

- 1) Perimeter fencing has been accounted for in the cost estimate on both sides of the ROW.
- 2) Private crossings will be protected by fence gates and signs, not active warning systems.
- 3) Existing grade crossing warning/protection will be upgraded as needed with crossing gates, signs, crossbucks, flashers, etc.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-59 Ensuring that customers have access to freight service must be accomplished in a way that does not require freight trains to operate on dedicated passenger tracks.

Response As stated in Sections ES-6, 1.5 and 1.6, one of the High Speed Empire Corridor Program's performance objectives is to "Minimize interference with freight rail operations" and one of its goals includes "Contribute to economic revitalization by accommodating forecasted growth in population and employment and corridor rail freight operations." NYSDOT is committed to reaching the objectives and goals including ensuring working with CSXT to develop a program that accommodates all users, including freight customers. Localized controlled sidings, passenger bypasses and dedicated freight/passenger track segments can be used to minimize congestion and reduced speeds resulting from operations of freight and passenger trains on each alternative. The proposed flyovers are a capital intensive, but effective infrastructure improvement that could be designed to reduce passenger/freight interference. The concepts for the three flyovers presented in this Tier 1 FEIS would be developed further in Tier 2 design. Other alternatives could be explored by developing a series of joint improvements both for station access and layouts and track/signal systems and alignment.

Commenter Renjel, Jr., Louis E., Vice President, CSX Transportation

Comment RR-3-60 The DEIS fails to answer the question of who will own the proposed passenger railroad and its infrastructure, and who will operate and maintain the railroad. Consequently, it fails to consider whether that entity—or entities—will have the legal and financial capacity to undertake the mitigation and compensation measures the DEIS contemplates. As noted above, CSXT will not own, maintain, dispatch or operate on passenger-exclusive tracks. The DEIS must be revised to address this glaring omission. It must identify the entity, or at least the possible entities, that will own and that will operate the passenger rail service on the Empire Corridor. It must explain how these entities can be expected to pay the substantial expenses the DEIS relies upon. And it must confirm that they will have the legal capacity to carry out their responsibilities. An EIS that evaluates alternatives based on "unexplained assumptions" violates NEPA

Response	Section 2.1 reviews the ownership, operating and maintenance responsibilities for the Empire Corridor, and changes to the current situation have not been negotiated. At this stage of the program, ownership, operation and maintenance of the railroad has not been formally identified. NYSDOT will provide further information as the program progresses and further details are developed and will be discussed and provided in the Tier 2 analysis.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-61	An Environmental Impact Statement must discuss “whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.” 40 C.F.R. § 1508.27. Here, the DEIS fails to properly analyze the project’s negative impact on air quality, an issue at the heart of NEPA. As discussed above, the DEIS does not adequately examine the environmental impact of moving freight traffic off the rails and onto the highways, and the attendant obligations under the Clean Air Act.
Response	Section 4.19 of the Tier 1 EIS analyzes potential impacts to air quality and Section 4.20.4 includes an analysis and discussion of greenhouse gas emissions, which are both anticipated to result in net reductions of air pollutants. Further analyses will be conducted in Tier 2 analysis as the program progresses. The Tier 1 FEIS determined that the none of the Build Alternatives would negatively affect freight train travel times, and therefore no substantial shift of freight traffic from rails to highways would be expected to occur in the future with this program.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-62	The DEIS largely avoids questions of cumulative impact. Regulations issued by the Council on Environmental Quality, the Department of Transportation and the FRA all require evaluation of a project’s cumulative impact. The DEIS does not address the impact on upstate New York air service if those passengers do in fact divert to rail.
Response	Section 4.24 of the Tier 1 FEIS analyzes potential indirect and cumulative impacts under the Build Alternatives. As discussed in Appendix B, Ridership and Revenue Forecasting, it is projected that the mode share for air travel, which was 1.113% in 2012, will decrease to a range of 0.881% to 0.951% under the Build Alternatives in 2035. Impacts from ridership under each of the Build Alternatives, including passengers shifting from air travel and other modes to rail, have been incorporated into pertinent sections of Appendix E and Chapter 4 of the Tier 1 FEIS.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-63	The DEIS lacks any analysis of high-speed passenger rail as a nascent technology that has yet to be implemented anywhere in the United States.
Response	Section 3.1 discusses the improvements to station stops, equipment and other physical improvements required under each of the Build Alternatives. Such improvements utilize established technologies for infrastructure and rolling stock such as employing existing rail coach and locomotive equipment and standard track geometries and signal systems. Even Alternative 125 will use currently available locomotive and coach configurations already standard on Amtrak's Acela express service.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-64	The DEIS does not adequately address the difficulties that will arise from building the project section-by-section. There is no analysis of how the work along the Empire Corridor will be staged, which segments will be constructed first, and how a segmented build process will impact operations. In light of the DEIS’s assumption that the entire project will take decades to complete, the failure to analyze this critical issue deprives decisionmakers of information they need to reach a reasoned judgment.

Response	<p>As the program progresses, the Tier 2 process will include more details on the means and methods of program construction and potential impacts in each segment. Section 3.3 describes construction staging for Alternatives 90B and 110: “For the 90 mph and 110 mph Alternatives, the new higher speed tracks for passenger trains would be installed on the north side of the existing railroad alignment. This would avoid conflicts with the existing train movements on the route while the new tracks for the higher speed were being installed and would minimize construction impacts on rail traffic.”</p> <p>To account for complex track construction phasing, additional costs were added in the program cost estimate for certain sections. Various areas along the corridor will require complex phasing plans to maintain existing freight and passenger service during construction of the proposed alternatives. A value ranging from 20% to 150% of the trackwork costs was assigned based on expected complexity.</p> <p>Staging and phasing will be coordinated so that new track and crossovers are installed off-peak and cutover prior to removals/realignment of existing track. Outages will be coordinated with CSXT to limit impact to daily operations. Preferences will be made to piggyback on adjacent outages required for annual maintenance/SOGR work.</p>
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-65	The DEIS does not address the project’s impact on elderly and handicapped individuals.
Response	As discussed in Section 4.3.4, each of the Build Alternatives are anticipated to provide positive benefits to the general traveling public including those at least 65 years of age and disabled individuals, primarily by improving mobility and travel choices within the corridor. The Environmental Justice and Title VI analysis has been modified to include persons at least 65 years of age and those with disabilities. In addition, Limited English Proficiency (LEP) populations have also been identified as part of this impact assessment. The results of this analysis are presented in Section 4.4 of the Tier 1 FEIS and in Appendix G.4.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-66	The DEIS fails to include any discussion of what steps will be taken to ensure that CSXT has sufficient protection from potential liability arising from passenger operations on its right-of-way.
Response	Freight and passenger operations are comingled on the right-of-way today. Any potential changes to current agreements addressing liability will be addressed in the future.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-67	I am writing on behalf of CSX Transportation (“CSXT”) to request a 30-day extension to the deadline for comments on the Tier One Draft Environmental Impact Statement (“DEIS”) for the High Speed Rail Empire Corridor Program. We ask that the deadline be extended from March 24, 2014 to April 23, 2014.
Response	The Public Comment Period was extended to April 30, 2014.
Commenter	Renjel, Jr., Louis E., Vice President, CSX Transportation
Comment RR-3-68	Because the 125 alternative would create a largely separate passenger-rail corridor that would minimize interference with freight traffic, it is the most promising of the build alternatives.
Response	Because Alternative 125 would maintain regional service on the existing Empire Corridor, it would offer no benefits or improvements to existing freight service compared to the Base

Alternative. Therefore, it would not perform as well as Alternatives 90B or 110, which provide additional trackage to better segregate passenger and freight rail.

Commenter **Smith, Michael V., President, Finger Lakes Railway Corp.**

Comment
RR-4-1 FGLK believes that the primary focus should be on the 90 mph option with emphasis on infrastructure improvements that will improve the speed, consistencies, and efficiencies of operations for both freight and passenger services.

Response Thank you for taking the time to review the alternatives outlined in the Tier 1 EIS for the High Speed Rail Empire Corridor Program. Your comment supporting the 90A and 90B Alternatives has been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative.

Commenter **Smith, Michael V., President, Finger Lakes Railway Corp.**

Comment
RR-4-2 Since freight service is primary on the Empire Corridor, connecting and growing freight operations, such as FGLK's and the Susquehanna's at Solvay, NY (as two examples), should be unimpeded and physically enhanced as part of the improvement program(s).

Response Your participation and comments from New York State railroads comprise an important part of the Tier 1 EIS process. The importance of preserving and improving freight rail traffic has been an important factor in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B would result in the best on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains (of all of the alternatives considered, as shown on Exhibit 6-8 of the Tier 1 FEIS. The installation of additional third and fourth tracks under Alternative 90B would add capacity and provide the ability to route passenger trains around freight trains even while passenger trains operate at higher speeds. In 2035, Alternative 90B would also result in one of the lowest trip times for freight between Selkirk Yard, outside Albany, and Buffalo.

Commenter **Mowery, Chad, Genesee & Wyoming, Inc.**

Comment
RR-5-1 I am concerned that the proposed high speed rail corridor would negatively affect business operations.

Response Thank you for reviewing the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. The goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The importance of preserving and improving freight rail traffic has been an important factor in the selection of Alternative 90B as the Preferred Alternative. Please refer to the detailed response to comment RR-4-2 summarizing Alternative 90B's favorable performance with respect to freight operations compared to the Base and most of the other alternatives.

Commenter **Mowery, Chad, Genesee & Wyoming, Inc.**

Comment
RR-5-2 I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.

Response We appreciate your review and comments discussing the alternatives for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the

selection of the Preferred Alternative, Alternative 90B. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. As noted above, in 2035, Alternative 90B would involve the least delay-minutes per 100 train miles operated for freight trains (of all of the alternatives considered), and would result in one of the lowest trip times for freight between Selkirk Yard, outside Albany, and Buffalo. As described in Chapter 6 of the Tier 1 FEIS, Alternative 90B would improve freight operations compared to the Base Alternative.

Commenter	Cheshier, Gregory A., Vice President of Operations, Genesee Valley Transportation Company, Inc.
Comment RR-6-1	Genesee Valley Transportation encourages the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90mph A, 90mph B, 110mph and 125mph alternatives, put forth in the High Speed Rail Empire Corridor Tier 1 Draft Environmental Impact Statement (DEIS), commingle freight and high speed passenger rail, significantly constraining freight rail operations.
Response	Participation by New York State railroads is a valued part of the process for the Tier 1 EIS for the High Speed Rail Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of Alternative 90B as the Preferred Alternative. Please refer to the detailed response to comment RR-4-2 summarizing Alternative 90B's favorable performance with respect to freight operations compared to the Base and most of the other alternatives.
Commenter	Blabey II, Eugene H., President/CEO, Avon & Lakeville Railroad Corporation, Livonia
Comment RR-7-1	I'm concerned that, if implemented, proposals for high speed passenger trains on the rail corridor linking Buffalo and Schenectady will negatively impact service from CSX at Genesee Junction (Henrietta, NY).
Response	Participation by New York State railroads is a valued part of the process for the Tier 1 EIS for the High Speed Rail Empire Corridor Program. The importance of preserving and improving freight rail traffic to the economy of New York State was an important factor in the selection of Alternative 90B as the Preferred Alternative. As indicated on Exhibit 6-8 of the Tier 1 FEIS, Alternative 90B would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered in 2035, and would result in one of the lowest trip times for freight between Selkirk Yard, outside Albany, and Buffalo.
Commenter	Blabey II, Eugene H., President/CEO, Avon & Lakeville Railroad Corporation, Livonia
Comment RR-7-2	I urge NYSDOT to do everything it can to help the economy in upstate New York by protecting CSX freight service on the Empire Corridor. Please select the base alternative in the DEIS.
Response	Thank you for your review and comment on the alternatives in the Tier 1 DEIS. The importance of preserving and improving freight rail traffic to the economy of New York State was an important factor in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B would result in better segregation of passenger trains from freight trains than the Base Alternative. The installation of approximately 370 miles of trackage under Alternative 90B would add capacity and would provide the ability to route passenger trains around freight trains even while passenger trains operate at higher speeds.

Commenter	Goss, Raymond A., President, Massena Terminal Railroad
Comment RR-8-1	The Massena Terminal Railroad wishes to express its support for the "Base Alternative"... We therefore respectfully request your support of the "Base Alternative"...
Response	Thank you for your review and comment on the alternatives in the Tier 1 DEIS. As noted above, the Preferred Alternative (Alternative 90B) will add approximately 370 miles of tracks, resulting in better segregation of passenger trains from freight trains than the Base Alternative.
Commenter	Fogel, David, Deputy Director, Metro-North Railroad
Comment RR-9-1	Metro-North generally supports increased intercity traffic as long as no detrimental impact, including financial, results on the predominant commuter rail service. A corridor-wide operating and capital (normalized replacement) cost allocation cost sharing mechanism based on the federal Passenger Rail Investment and Improvement Act (PRIIA) Section 212 Northeast Corridor cost allocation formula would be an appropriate model for an Empire Corridor South shared use mechanism.
Response	Thank you for taking time to review the Tier 1 DEIS for the High Speed Rail Empire Corridor Program and sharing your comments on use of a cost-allocation and cost-sharing mechanism based on Section 212 of PRIIA for commuter and intercity passenger rail. Chapter 5 of the Tier 1 FEIS indicates that future cost-sharing arrangements will be governed by Section 209 of PRIIA. The Service Development Plan cites PRIIA NEC requirements and indicates that, for the Empire Corridor, NYSDOT will share both the capital and operating and maintenance costs of the program according to formulas based on shared benefits and intensity of use of the infrastructure by the parties. Tier 2 assessments for the program, as the design is advanced, will include further evaluation and refinement of funding and cost-sharing and cost allocation mechanisms and models.
Commenter	Fogel, David, Deputy Director, Metro-North Railroad
Comment RR-9-2	Please note that Metro-North is planning a future phase of the Penn Station Access project that would add a new Manhattan West Side link via Amtrak's Empire Connection for Hudson Line trains to serve Penn Station with a potential for new intermediate stations in Manhattan.
Response	The future Penn Station Access for Metro North via the West Side Connection has been included in Exhibit G-43 in Appendix G.21, Indirect and Cumulative Impacts. The interrelationship with this project will be further considered when the design is advanced in the Tier 2 assessments.
Commenter	Fogel, David, Deputy Director, Metro-North Railroad
Comment RR-9-3	Please note that based on preliminary engineering, the Poughkeepsie Main Line Track and interlockings locations shown for the Build Alternative Engineered Track Schematics are subject to change.
Response	Thank you for sharing a reminder that the Poughkeepsie Main Line and interlockings locations for the Build Alternative Engineered Track Schematics may change. As the Empire Corridor High Speed Rail program progresses to the Tier 2 assessments, detailed evaluation of potential designs and further coordination with MetroNorth regarding Hudson Line improvements will be performed.

Commenter	Dingman, Robert, President, New York & Lake Erie Railroad
Comment RR-10-1	We are concerned that the proposed high speed rail corridor would negatively affect business operations.
Response	Participation by New York State railroads is a valued part of the process for the Tier 1 EIS for the High Speed Rail Empire Corridor Program. As indicated on Exhibit 6-8 of the Tier 1 FEIS, Alternative 90B would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered in 2035, and would result in one of the lowest trip times for freight between Selkirk Yard, outside Albany, and Buffalo.
Commenter	Dingman, Robert, President, New York & Lake Erie Railroad
Comment RR-10-2	I, Robert O. Dingman, Jr., President of the New York & Lake Erie Railroad, encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.
Response	Thank you for your review and comment on the alternatives in the Tier 1 DEIS. The importance of preserving and improving freight rail traffic to the economy of New York State was an important factor in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B would result in better segregation of passenger trains from freight trains than the Base Alternative. The installation of approximately 370 miles of tracks under Alternative 90B would add capacity and provide the ability to route passenger trains around freight trains even while passenger trains operate at higher speeds.
Commenter	Fenno, Nathan R., President, The New York Susquehanna and Western Railway Corporation
Comment RR-11-1	we encourage the selection of the base alternative to maintain our ability to continue to provide safe, reliable and efficient service. The proposed 90A, 90B and 110 alternatives put forth in the DEIS comingle freight and high speed rail significantly constrain freight rail operations.
Response	Thank you for your review and comment on the alternatives in the Tier 1 DEIS. As noted above, the Preferred Alternative (Alternative 90B) will add approximately 370 additional miles of additional tracks, resulting in better segregation of passenger trains from freight trains than the Base Alternative.
Commenter	Saracen, Sandra, Ontario Midland Railroad Corp.
Comment RR-12-1	I am concerned that the proposed high speed rail corridor would negatively affect business operations.
Response	Participation by New York State railroads is a valued part of the process for the Tier 1 EIS for the High Speed Rail Empire Corridor Program. The goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of Alternative 90B as the Preferred Alternative. Please refer to the detailed response to comment RR-4-2 summarizing Alternative 90B's favorable performance with respect to freight operations compared to the Base and most of the other

alternatives.

Commenter	Saracen, Sandra, Ontario Midland Railroad Corp.
Comment RR-12-2	I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.
Response	Thank you for reviewing the alternatives in the Tier 1 DEIS. As noted above, the Preferred Alternative (Alternative 90B) will add trackage with approximately 370 additional miles, resulting in better segregation of passenger trains from freight trains than the Base Alternative.
Commenter	Fink, David A., President, Pan Am Southern LLC
Comment RR-13-1	PAS is also concerned with the potential impact of the Project on the ability of PAS to efficiently interchange traffic with CSXT in New York and elsewhere.
Response	Participation by New York State railroads is a valued part of the process for the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. The importance of preserving and improving freight rail traffic was an important factor in the selection of Alternative 90B as the Preferred Alternative. As indicated on Exhibit 6-8 of the Tier 1 FEIS, Alternative 90B would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered in 2035, and would result in one of the lowest trip times for freight between Selkirk Yard, outside Albany, and Buffalo. Alternative 90B would result in better segregation of passenger trains from freight trains than the Base Alternative. The installation of approximately 370 miles of additional tracks under Alternative 90B would add capacity and would provide the ability to route passenger trains around freight trains even while passenger trains operate at higher speeds.
Commenter	Fink, David A., President, Pan Am Southern LLC
Comment RR-13-2	Since alternatives 90A, 90B and 110 will each cause commingling of freight and passenger service, there is a real concern that these options will substantially limit the ability of railroads to grow to meet heightened customer demand. For that reason, PAS opposes these proposals.
Response	Thank you for reviewing the alternatives in the Tier 1 DEIS. As noted above, the Preferred Alternative (Alternative 90B) will add approximately 370 miles of tracks, resulting in better segregation of passenger trains from freight trains than the Base Alternative.
Commenter	Goss, Raymond A., President, Rochester & Southern Railroad, Inc.
Comment RR-14-1	The Rochester & Southern Railroad wishes to express its support for the "Base Alternative" We therefore respectfully request your support of the "Base Alternative"...
Response	Thank you for reviewing the alternatives in the Tier 1 DEIS. The importance of preserving and improving freight rail traffic to the economy of New York State was an important factor in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B would result in better segregation of passenger trains from freight trains than the Base Alternative. The installation of approximately 370 miles of additional tracks under Alternative 90B would add capacity and would provide the ability to route passenger trains around freight trains even while passenger trains operate at higher speeds.

Commenter	Galloway, Drew, Chief of Planning, Amtrak
Comment RR-15-1	Chief of planning for Amtrak for the Northeast Corridor. What I am happy to endorse is the process. In that respect, I think the alternatives that have been discussed and evaluated are pragmatic, spanning in range in terms of investment potential and in ridership and in revenue, and from an Amtrak perspective, we are very pleased to support the process.
Response	Thank you for offering your comments on the process for the Tier 1 DEIS for the High Speed Rail Empire Corridor Program.

Commenter	Blinkoff, Jason, Executive Vice President, A&R Bulk-Pak, Inc., A&R Bulk-Pak, Inc.
Comment O-1-1	<p>Our company, A&R Bulk-Pak, receives plastics and grains by railcar which are transloaded into containers for overseas export and domestic distribution. In 2013, we handled 935 freight railcars and based on 1st quarter results for 2014 to date, we expect a 20-25% increase in rail freight traffic for this year. In addition, we are in the midst of infrastructure development which will push our yearly rail volume higher while continuing to reduce inbound truck traffic in and around the busy Port of New York/New Jersey.</p> <p>I appreciate the state's continued focus on economic development and pro-business efforts, but I am concerned the proposed high speed rail corridor will negatively affect our business operations. Our company especially relies on the existing freight rail network for efficient, reliable, and economical transportation of goods. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail and will significantly constrain freight rail operations into our Elizabeth and Avenel facilities. Compromised or limited service on the current freight network will force my company to alter our business operations and shift our cargo receipt pattern from rail to truck thereby increasing cost, increasing our environmental footprint, and increasing truck traffic on New Jersey and New York roadways as 50% of our inbound rail freight originates in Northwestern New York State.</p>
Response	<p>Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a preferred Alternative.</p>
Commenter	Blinkoff, Jason, Executive Vice President, A&R Bulk-Pak, Inc., A&R Bulk-Pak, Inc.
Comment O-1-2	I strongly urge the state to maintain current freight service and the capacity for growth by selecting the base alternative.
Response	<p>Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. As outlined above, this alternative would improve both passenger and freight rail capacity and operations. Improvement of passenger rail service, while maintaining freight operations along the Empire Corridor, is one of the goals for the HSR Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. The importance of preservation and the improvement of freight rail traffic to the economy of New York State has been a critical factor in the selection of the Preferred Alternative.</p>
Commenter	Allen, Linda, Advocates for Rensselaer Trails (ART), Advocates for Rensselaer Trails (ART)
Comment O-2-1	I strongly support improvements to the High Speed Rail Empire Corridor. I am supportive of alternatives 90B and 110.
Response	Your comment in support of the 90B and 110 Alternatives has been considered by the FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. For reasons of

safety, CSXT, the owner of the right-of-way, requires a 30-foot track separation between freight and passenger tracks when passenger trains operate at 110 mph. In many places on the route, this is only possible by acquiring significant additional property. Because of the required property acquisition, Alternative 110 would have significantly higher costs and greater potential for environmental impacts than Alternative 90B, while only achieving a modest improvement in overall performance.

Commenter Allen, Linda, Advocates for Rensselaer Trails (ART), Advocates for Rensselaer Trails (ART)

Comment 0-2-2 I would like to express one concern with respect to the alternatives outlined in the draft EIS, and that is the lack of a pedestrian walkway on the replacement Livingston Avenue Bridge, which is part of all alternatives except the base alternative. I realize that the draft EIS is only a high level Tier 1 review and a more detailed review will be conducted in the future of the selected alternative, but I strongly encourage the NYS DOT to include a pedestrian walkway in the project at this early stage of development.

In particular, the walkway would:

- Increase the travel choices and improve air quality by providing additional commuting and travel options for residents and workers,

- Contribute to the economic revitalization by linking the planned riverfront developments in both Rensselaer and Albany,

- Improve environmental quality by reducing reliance on automobile travel.

The project has the potential to not only improve one mode of transportation but also enhance the intermodal opportunities more generally. Moreover, bicycle transportation and pedestrian walkways are supported and encouraged under major transportation legislation, including the Intermodal Surface Transportation Efficiency Act and Transportation Equity Act for the 21st Century, so the NYS DOT clearly has a mandate to include a walkway on the Livingston Avenue Bridge

Response Thank you for your comment regarding pedestrian access on the Livingston Avenue Bridge between Albany and Rensselaer, New York. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. The Livingston Avenue Bridge Project has independent utility due to its physical condition. For more information on the Livingston Avenue Bridge, please visit the LAB project website <https://www.dot.ny.gov/livingstonavebridge>.

Commenter Allen, Linda

Comment 0-2-3 I support the improvements to the High Speed Rail Empire Corridor, which provides an alternative mode of transportation for New Yorkers, as well as others who travel through the state.

Overall, I think the draft EIS provides a good assessment of alternatives for improving inner-city passenger rail service in the State, and personally I'm supportive of Alternatives 90B and 110. I think those two alternatives provide notable improvements in rail service at a reasonable cost.

Response Thank you for your interest in the High Speed Rail Empire Corridor Program. The Tier 1 EIS evaluates a range of corridor-level service improvements for the purpose of making decisions on corridor-level service, including service reliability, service frequency, and train speeds. Individual projects, or groups of projects, will undergo a second evaluation (Tier 2) to determine the best alternative for that program, or group of projects including looking at options for pedestrian/bicycle accommodations. Comments from the public, relating to the High Speed Rail Empire Corridor Program, have been considered by FRA and NYSDOT in the selection process for a Preferred Alternative.

Commenter	Allen, Linda
Comment O-2-4	<p>However, I would like to voice one concern with respect to the alternatives outlined in the draft EIS, and that is the lack of a pedestrian walkway on the replacement Livingston Avenue Bridge, which is part of all of the build alternatives.</p> <p>...but I strongly encourage the DOT to include a pedestrian walkway in the project in this early stage of development, given that it is included in all the build alternatives.</p>
Response	<p>Thank you for your comment regarding pedestrian access on the Livingston Avenue Bridge between Albany and Rensselaer, New York. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. The Livingston Avenue Bridge Project has independent utility due to its physical condition. For more information on the Livingston Avenue Bridge, please visit the LAB project website https://www.dot.ny.gov/livingstonavebridge.</p>
Commenter	Worden, Lorenz M., President, Albany Bicycle Coalition, Albany Bicycle Coalition
Comment O-3-1	<p>The planned rebuilding of Albany's Livingston Avenue Railroad Bridge presents a one-time, unique opportunity to provide a pedestrian and bicycle link between both sides of the Hudson River.</p> <p>One can easily envision both recreational and commuter bicyclists using the link to decrease traffic congestion, promote tourism, reduce pollution, and increase health. The cost of this minor augmentation to the bridge will be minimal with the project's scope. By contrast, its impact on economic development, recreation, and environmental quality, will be great and lasting. Local governing bodies and planning commissions have fully endorsed this project, as has Senator Schumer.</p>
Response	<p>Thank you for your comment regarding pedestrian access on the Livingston Avenue Bridge between Albany and Rensselaer, New York. The Livingston Avenue Bridge Project (and associated EA) is along the same corridor and is considered a component of the program for Tier 1 assessments, but is being designed and implemented as a separate project. Commenter	Worden, Lorenz M., President, Albany Bicycle Coalition, Albany Bicycle Coalition
Comment O-3-2	<p>We in the Albany Bicycle Coalition, on behalf of pedestrians and cyclists in the Capital Region, are asking your support for one small but key provision: restoration of a walkway/bikeway on the new bridge.</p>
Response	<p>Thank you for your comments on the Livingston Avenue Bridge. The Tier 1 FEIS document notes the support for the pedestrian walkway and bicycle path on the bridge.</p>
Commenter	Worden, Lorenz M., President, Albany Bicycle Coalition, Albany Bicycle Coalition
Comment O-3-3	<p>What rail travel needs in NYS is the following:</p> <ul style="list-style-type: none"> • On time departure and on time arrival • No wrecks • Reasonable cost <p>After Amtrak has achieved the above real needs, then will be the time to concern yourselves with speed.</p>
Response	<p>Thank you for your comments on the needs for improving intercity rail passenger service on the Empire Corridor. The High Speed Rail Empire Corridor Tier 1 EIS evaluates a range of corridor-level service improvements for the purpose of making decisions on corridor-</p>

	level service, including service reliability, service frequency, and train speeds, which will meet the goals that outlined in your comment.
Commenter	Healy, Edward B., Alliance Shippers, Inc., Alliance Shippers, Inc.
Comment O-4-1	I am concerned that the proposed high speed rail corridor would negatively affect business operations.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.
Commenter	Healy, Edward B., Alliance Shippers, Inc., Alliance Shippers, Inc.
Comment O-4-2	I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations. Compromised or limited service on the current freight network may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways. I urge the state to maintain current freight service and the capacity for growth by selecting the base alternative. An optimized freight rail network will foster economic development, sustain jobs and help job growth as well as position existing and future New York businesses for success.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. As outlined above, this alternative would improve both passenger and freight rail capacity and operations. Improvement of passenger rail service, while maintaining freight operations along the Empire Corridor, is one of the goals for the HSR Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. The importance of preservation and the improvement of freight rail traffic to the economy of New York State has been a critical factor in the selection of the Preferred Alternative.
Commenter	Lefcourt, Ronald, Alliance Shippers, Inc., Alliance Shippers, Inc.
Comment O-4-3	Alliance Shippers Inc., a universal transportation company, has many services. In the year 2013 one major division of our company moved in excess of 50,000 trailer loads requiring temperature control throughout the United States of America. The majority of those truckload shipments are fresh produce from the states of Washington, Oregon, California and Arizona. We probably handle about 100 trailer loads of produce per week into the New York City area. We use CSX Transportation for the majority of those trailer loads. CSX receives our trailers at a Chicago Interchange point and then transports these trailer loads of fresh produce into their North Bergen NJ intermodal terminal. From there our delivery agents complete the process by delivering to customers in the Bronx Terminal Market, Queens and Brooklyn, NY.

Any slowdown in CSX service for fresh produce could change the customer's mode of transportation from railroad intermodal to highway trucks. The result of this would be emitting considerably more hydrocarbons into our atmosphere. Our company also ships thousands of loads of various commodities in and out of the New York Metropolitan area. The impact on this business could also be affected to some degree.

Response Thank you for your comment discussing the importance of shipping by rail, which has been considered by the FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. The High Speed Rail Empire Corridor Program is committed to improving rail service in New York State for both freight and passenger trains, and this will also benefit the many shippers and users of rail service along this important corridor.

Commenter Norton, Scott, AMERICAN Cast Iron Pipe Company, AMERICAN Cast Iron Pipe Company

Comment O-5-1 I am concerned that the proposed high speed rail corridor would negatively affect business operations.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.

Commenter Norton, Scott, AMERICAN Cast Iron Pipe Company, AMERICAN Cast Iron Pipe Company

Comment O-5-2 I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations. Compromised or limited service on the current freight network could force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B will provide approximately 370 miles of additional trackage to better segregate passenger and freight traffic and will reduce travel times between New York City and Niagara Falls by 1½ hours in 2035, compared to the Base Alternative. Alternative 90B would also involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.

Commenter Goldrick, Joseph, AMG Resources, AMG Resources

Comment O-6-1 I am concerned that the proposed high speed rail corridor would negatively affect business operations. Compromised or limited service on the current freight network may force my company to alter our business operations at increase cost for the alternatives.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.

Commenter Goldrick, Joseph, AMG Resources, AMG Resources

Comment I urge the state to maintain current freight service and the capacity for growth.
O-6-2

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.

Commenter Fredericksen, Scott, President Transportation, Archer Daniels Midland, Archer Daniels Midland

Comment I urge the state to consider the impact on freight rail operations when selecting a high speed passenger rail alternative.
O-7-1
In recent years we have shipped many thousands of railcars annually to the state. These shipments are accompanied by multi-million dollar freight bills each year. Fast, predictable and consistent transit times are critical to our business. If these criteria deteriorate our shipments to the state will decrease significantly. Our customers would find non-rail transportation solutions or even shift volume to alternative markets to meet their demand

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.

Commenter Fredericksen, Scott, President Transportation, Archer Daniels Midland, Archer Daniels Midland

Comment In selecting an option, I encourage the state to maintain freight connectivity and the capacity to expand such service in the future. Advancing high speed passenger rail at the detriment of freight rail would limit opportunities for business and job growth and would be detrimental to the state economy.
O-7-2

Response Thank you for your comments discussing the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B will provide approximately 370 miles of additional trackage to better segregate passenger and freight traffic and will reduce travel times between New York City and Niagara Falls by 1½ hours in 2035, compared to the Base Alternative. Alternative 90B would also involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.

Commenter	Sage, Samuel H., President, Atlantic States Legal Foundation, Inc., Atlantic States Legal Foundation, Inc.
Comment O-8-1	Further, ASLF would suggest that DOT further generate and support for this project.
Response	Thank you for your comment, and support of the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of the Preferred Alternative.
Commenter	Sage, Samuel H., President, Atlantic States Legal Foundation, Inc., Atlantic States Legal Foundation, Inc.
Comment O-8-2	The 110mph option stands out from the others as the most desirable due to its feasibility and environmental outcomes.
Response	Your comment in support of the 110 Alternative has been considered by the FRA and NYSDOT in the selection process for a Preferred Alternative. Because of the required property acquisition, Alternative 110 would have significantly higher costs and greater potential for environmental impacts than Alternative 90B, while only achieving a modest improvement in overall performance. For these reasons, this alternative was dismissed from further consideration. Thank you for participating in the public review of the Tier 1 EIS for the High Speed Rail Empire Corridor Program.
Commenter	Sage, Samuel H., President, Atlantic States Legal Foundation, Inc., Atlantic States Legal Foundation, Inc.
Comment O-8-3	Passenger usage should be recalculated after considering connecting buses and potentially local train service to provide connecting trains at major station stops. California is doing this and coordinating other modes of travel with train service
Response	Thank you for your comments on improving connectivity between different modes of transportation with rail passenger service, which has been considered in the development of the Service Development Plan. Individual projects, or groups of projects, will be advanced according to the Service Development Plan in Tier 2 environmental evaluations and design development. For station projects, opportunities for multimodal connectivity will be pursued with the local municipality and transit provider.
Commenter	Sage, Samuel H., President, Atlantic States Legal Foundation, Inc., Atlantic States Legal Foundation, Inc.
Comment O-8-4	Major increase in the timetable would result from eliminating the need for switching engines in Albany. The cost of this would be modest in relation to gain in time.
Response	Thank you for your comments on the timetable. The Tier 1 EIS and the Service Development Plan have considered the operations at the Albany-Rensselaer Rail Station as part of the identification of the Preferred Alternative. More detailed evaluation of timetables and station operations would be performed as part of Tier 2 assessments.
Commenter	Sage, Samuel H., President, Atlantic States Legal Foundation, Inc., Atlantic States Legal Foundation, Inc.
Comment O-8-5	Deficiencies in EIS: The analysis must be integrated with discussion options for new rolling stock. Higher performance rolling stock is needed. New Siemens 125mph locomotives modified for third rail pickup would be one alternative. Adopting them for third rail is not technologically difficult or too costly. Higher performance engines and cars will save money on fuel, maintenance, etc. Tilt body trains such as those tested in the late 80's on the Northeast corridor would allow increased travel speeds

Response	Thank you for your comments discussing different types of locomotives that could be utilized on the route. Identification and selection of the locomotives to be used on the route will be developed further as the FRA and NYSDOT refine the Preferred Alternative in Tier 2 assessments.
Commenter	Sage, Samuel H., President, Atlantic States Legal Foundation, Inc., Atlantic States Legal Foundation, Inc.
Comment O-8-6	There is a need for better distribution and dissemination of the draft EIA. Paper copies should be put into more document depositories – our office library is one such that could be used. You should also supply copies on CD's for interested parties
Response	<p>Thank you for your suggestions on the distribution and availability of the High Speed Rail Empire Corridor Program documents and materials. All the information for the public hearings was (is) available at: https://www.dot.ny.gov/empire-corridor</p> <p>The four volumes of the of the Tier 1 DEIS were and still are available online at: https://www.dot.ny.gov/empire-corridor/deis</p> <p>Copies of all the materials for the High Speed Rail Empire Corridor Program were available by contacting the program staff for both printed or compact disc materials or directly from the program website. Moving forward with the program, the website and other supporting materials will be updated, as appropriate, and available to the public.</p>
Commenter	Price, George, Berg Steel Pipe, Berg Steel Pipe
Comment O-9-1	I am concerned that the proposed high speed rail corridor would negatively affect business operations.
Response	<p>Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.</p>
Commenter	Price, George, Berg Steel Pipe, Berg Steel Pipe
Comment O-9-2	<p>I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.</p> <p>I urge the state to maintain current freight service and the capacity for growth by selecting the base alternative. An optimized freight rail network will foster economic development, sustain jobs and help job growth as well as position existing and future New York businesses for success.</p>
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight

	rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.
Commenter	Price, George, Berg Steel Pipe, Berg Steel Pipe
Comment O-9-3	Comprised or limited service on the current freight network will have a negative effect on my business, increasing the cost of doing business in New York.
Response	Thank you for your comments discussing the High Speed Rail Empire Corridor Program. As outlined above, the Preferred Alternative would improve both passenger and freight rail capacity and operations along the Empire Corridor, which would benefit both freight shippers and passengers.
Commenter	Locke, Steve, BSPS Trustee President, Bergen Swamp Preservation Society, Bergen Swamp Preservation Society
Comment O-10-1	On behalf of the trustees of the Bergen Swamp Preservation Society (BSPS) I am asking that the BSPS be included as a party of interest for the High Speed Rail Corridor Program. We ask that you forward all present and future notifications regarding this program. The BSPS is the first and oldest private ecological preservation land trust in the United States. We are chartered by the New York State Department of Education as a "Living Museum". We have a membership of 400 persons / corporations and we oversee five separate properties located throughout upstate New York, The Bergen Swamp was this nations first designated National Natural Landmark.
Response	Thank you for your comments and your interest in High Speed Rail Empire Corridor Program. The Bergen Swamp Preservation Society (BSPS) will be included as a party of interest for the New York State High Speed Rail program, and NYSDOT and the FRA recognize the importance of protecting the preserve as a National Natural Landmark.
Commenter	Locke, Steve, BSPS Trustee President, Bergen Swamp Preservation Society, Bergen Swamp Preservation Society
Comment O-10-2	Our Society and our membership strongly oppose any alternative plan that would deviate the rail lines from the present rail corridor through Genesee County. This corridor is owned by New York Central Lines LLC. We specifically ask that all rail lines stay within current New York Central Lines LLC properties identified by Town of Bergen SWIS code & Tax map parcel numbers 18268913.-1-53, 1826012.-1-42, 1826011.-1-59, 1826011.-1-56, 18268915.-1-26 and Town of Byron SWIS code & Tax map parcel numbers 18300010.-1-28 and 18300009.-1-59. Some of your proposals describe the construction of a new rail corridor that deviates several miles north of the present rail corridor. This new "northern" rail line would be constructed along Warboys Rd. through the Town of Bergen & Byron. This would be along our Bergen Swamp northern border. Any proposed new construction that would direct a high speed rail corridor along the borders of the Bergen Swamp, this nations first and most prestigious ecological sanctuary, is a train off the tracks.
Response	Thank you for your comments discussing the proposed alignment of the 125 alternative, and the importance of protecting the Bergen Swamp Preserve is recognized by the FRA and NYSDOT. The 125 Alternative was the conceptual alignment for the purposes of the Tier 1 assessment, and this alternative has been dismissed from further consideration.
Commenter	Bhandari, Amit, BioUrja Trading, LLC, BioUrja Trading, LLC
Comment O-11-1	I am concerned that the proposed high speed rail corridor would negatively affect business operations. Compromised or limited service on the current freight network may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.

Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Alternative 90B would also involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.
Commenter	Bhandari, Amit, BioUrja Trading, LLC, BioUrja Trading, LLC
Comment O-11-2	I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.
Response	Thanks for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. As outlined above, this alternative would improve both passenger and freight rail capacity and operations.
Commenter	Batchelor, Gary, BlueLinx Corporation, BlueLinx Corporation
Comment O-12-1	I am concerned that the proposed high speed rail corridor would negatively affect business operations. BlueLinx Corporation, a leading distributor of building products, has many warehouses which will be negatively impacted by the high speed rail corridor. We rely on constant rail service everyday to meet customer commitments and remain cost competitive in this market. The lack of reliable rail freight service will result in increased costs, lost sales, negative growth opportunities. Compromised or limited service on the current freight network may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.
Commenter	Batchelor, Gary, BlueLinx Corporation, BlueLinx Corporation
Comment O-12-2	I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.

Commenter	Lund, Gregory W., Secretary/Treasurer Conrail/SAA/Alternate Legislative Representative, Brotherhood of Locomotive Engineers and Trainmen, CSX North General Committee of Adjustment, Brotherhood of Locomotive Engineers and Trainmen, CSX North General Committee of Adjustment
Comment O-13-1	I am a rep for the Brotherhood of Locomotive Engineers and Trainmen. I am currently a locomotive engineer in the Buffalo-Albany corridor, any plan such as 90A or 90B is really going to have to increase the overall capacity not only as far as the passenger side but also on the freight side. I say this because freight business within New York State and the lines that we travel over currently has probably increased in the last five years by 50 trains per week which would amount to seven trains per day and that does not leave you a lot of slots, a lot of slotting for passenger and/or freight. Freight is only going to increase as we go along. With that, separation is what we need because it does little good to a 90 or 110 mile an hour passenger train to get stuck behind a 50 or 60 mile an hour freight train.
Response	Thank you for your comments on of freight and passenger train operations on the Empire Corridor. Your assessment of the freight and passenger trains points to the need for improvements along the route. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. The FRA and NYSDOT are committed to improving both freight and passenger service, and the operation of passenger and freight trains along the Empire Corridor was a major factor in the selection of the Preferred Alternative.
Commenter	Kearnsing, David, Brotherhood of Locomotive Engineers and Trainmen, Brotherhood of Locomotive Engineers and Trainmen
Comment O-13-2	My name is David Kearnsing. I am with the Brotherhood of Local Engineers and Trainmen. I work for CSX. I heard some concerns about oil trains, safety on the rails and everything else. In 2013, railroads across the United States have had their safest year ever in personal on the job, as well as crossings and incidents on the rails themselves. Regarding the oil trains, the number of carloads that we have, have increased to over 400,000 carloads over the past five years...
Response	Thank you for your comments on the operation of trains along the Empire Corridor. The Preferred Alternative (Alternative 90B) identified by FRA and NYSDOT will improve safety by better segregating passenger and freight traffic and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. The Tier 1 EIS examined the operation of passenger and freight trains along the Empire Corridor, with critical focus on promoting both safe operations and allowing for expanded capacity to promote growth of rail traffic.
Commenter	Kearnsing, David, Brotherhood of Locomotive Engineers and Trainmen, Brotherhood of Locomotive Engineers and Trainmen
Comment O-13-3	High speed rail as we want it, the environmental impact would be tremendous. The visual would be ugly. It involves catenary lines that would interfere with the views of the rivers along the Mohawk, along the Hudson River. Higher speed rail and me running the trains, I propose and support the 110 or the 90B.
Response	Thank you for your comments on the different alternatives, which were considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative.
Commenter	McDermott, Terrence, Bunge North America, Bunge North America
Comment O-14-1	Bunge North America urges the state to consider the impact on freight rail operations when selecting an alternative.

Bunge North America ships grain products across the Empire Corridor rail line in New York from our processing and milling plants in the United States and Canada. This rail line provides the most cost-effective route over the long distances required to our customers in New York. It is critical for our businesses to maintain an efficient and consistent flow of our product and private rail cars to and from New York.

If service on the current freight network were compromised by the operation of high speed passenger rail, we could be forced to alter our business operations and possibly reduce shipping rail to customers in New York.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of the Preferred Alternative.

Commenter **McDermott, Terrence, Bunge North America, Bunge North America**

Comment O-14-2 In selecting an option, we encourage the state to maintain freight connectivity and the capacity to expand such service in the future.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.

Commenter **Klein, Mark, Cargill, Cargill**

Comment O-15-1 We are writing to express our opposition to the mixing of passenger and freight traffic on the CSX line between Albany and Buffalo.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.

Commenter **Klein, Mark, Cargill, Cargill**

Comment O-15-2 Albany is an important destination for agricultural products to move from the interior of the United States to markets in the east and for export through the Port of Albany. Our experience elsewhere shows that when we have passenger trains running past our facilities, we have seen a reduction in service. The passenger trains take precedence and switching trains into our facilities is curtailed. If the Buffalo-Albany corridor was high speed, we think the challenges would be even greater than what we have seen elsewhere.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor

Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Improvement of passenger rail service, while maintaining freight operations along the Empire Corridor, is one of the goals for the HSR Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. The importance of preservation and the improvement of freight rail traffic to the economy of New York State has been a critical factor in the selection of a Preferred Alternative.

Commenter **Drown, Matthew, Caterpillar, Caterpillar**

Comment O-16-1 I am concerned that the proposed high speed rail corridor would negatively affect business operations.
Compromised or limited service on the current freight network may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of the Preferred Alternative.

Commenter **Drown, Matthew, Caterpillar, Caterpillar**

Comment O-16-2 I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Improvement of passenger rail service, while maintaining freight operations along the Empire Corridor, is one of the goals for the HSR Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. The importance of preservation and the improvement of freight rail traffic to the economy of New York State has been a critical factor in the selection of the Preferred Alternative.

Commenter **Warner, Deborah S., Vice President for Public Policy and Government Relations, Center State Corporation for Economic Opportunity (CEG), Center State Corporation for Economic Opportunity (CEG)**

Comment O-17-1 In reviewing the study of the five alternatives, we note that there are positive results from any increased investment. However, we also are keenly aware that significant federal

resources would be needed for any but the Base Alternative to move forward. This is the major hurdle in the short term. One can hope that future funding would become available to enable New York State to move ahead with incremental, prioritized improvements in keeping with the DEIS findings.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by the FRA and NYSDOT in selecting Alternative 90B as the Preferred Alternative. Alternative 90B would involve substantially fewer right-of-way and environmental impacts than Alternatives 110 and 125 and would also be substantially less costly. Thank you for your support for the program and comments on prioritizing the improvements.

Commenter **Warner, Deborah S., Vice President for Public Policy and Government Relations, Center State Corporation for Economic Opportunity (CEG), Center State Corporation for Economic Opportunity (CEG)**

Comment O-17-2 It would be logical to reject the Base (No Action) Alternative because it brings no improvements beyond what is already approved and funded by the FRA.

Response Thank you for your comments on the alternatives in the Tier 1 DEIS. Your comment on rejecting the Base Alternative is noted and has been considered by the FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. Alternative 90B will provide approximately 370 miles of additional trackage to better segregate passenger and freight traffic and will reduce travel times between New York City and Niagara Falls by 1 ½ hours in 2035, compared to the Base Alternative.

Commenter **Warner, Deborah S., Vice President for Public Policy and Government Relations, Center State Corporation for Economic Opportunity (CEG), Center State Corporation for Economic Opportunity (CEG)**

Comment O-17-3 Alternative 125 is less preferable due to its high cost at nearly \$15 billion to build which generates the highest per rider cost of any of the alternatives.

Response Thank you for your comments on the cost of Alternative 125. Alternative 125 has been dismissed from further consideration in part based on its costs, it is the costliest alternative.

Commenter **Warner, Deborah S., Vice President for Public Policy and Government Relations, Center State Corporation for Economic Opportunity (CEG), Center State Corporation for Economic Opportunity (CEG)**

Comment O-17-4 Our interests are strongest for investments that improve the east-west corridor from Niagara Falls to Albany, as it has not benefitted as much from previous improvements as the Empire Corridor South between Albany and New York City. The Southern Corridor already runs a better schedule, more on time trips, having already been the beneficiary of more improvements than the Empire Corridor West. The current on time passenger train performance west of Albany of only 56 to 57 percent clearly must be addressed.

Response Thank you for your comments on the Tier 1 DEIS comparing the Empire Corridor south and west of Albany. In the Preferred Alternative, Alternative 90B, the number of trains serving the western portion of the Empire Corridor will increase, and there will be a reduction in trip time. In addition, the Preferred Alternative would have the best overall on-time performance of the alternatives considered. Unlike the 125 express service, which would bypass existing stations at Schenectady, Amsterdam, Rome, Utica, and Buffalo-Depew, it will improve service to these existing stations. Your comments have been considered by the FRA and NYSDOT in the selection process for the Preferred Alternative.

Commenter	Warner, Deborah S., Vice President for Public Policy and Government Relations, Center State Corporation for Economic Opportunity (CEG), Center State Corporation for Economic Opportunity (CEG)
Comment O-17-5	<p>It is clear from the DEIS that Alternative 110, costing \$6.25 billion and including new third and fourth main tracks, provides several distinct advantages. The one drawback of this alternative is that, while it would increase daily round trips, it would not offer express service.</p> <p>Improved rail infrastructure also increase the speed and capacity of our freight rail system, which benefits Upstate businesses and the entire northeast U.S. In the Buffalo-Niagara area alone, over 200 businesses depend heavily on rail for delivery and shipment of goods and products. These companies employ over 27,000 worker and have annual sales of over \$7.2 billion.</p> <p>The Impact Assessment states that around 3,500 worker are employed by 30 companies that manufacture railroad equipment in New York State. While these companies, with sales in excess of \$750 million, provide goods and services directly to the rail industry, an additional 11,000 Upstate workers are employed by businesses that produce and distribute goods to sectors that are heavily relied upon by the railroad rolling stock industry. New order of these businesses "represent a bright spot in the future of manufacturing and distribution in Upstate New York".</p> <p>The cities and regions along the Empire and Montreal Corridors each have world-class academic institutions, which would benefit from improvements, but could also provide invaluable assistance in the development and implementation of higher speed rail in New York State.</p> <p>With in just the 12-county Central Upstate region, 35 colleges and universities educate more than 130,000 students, the third highest concentration of college students in the entire country.</p> <p>New York's tourism economy will grow by fostering international trade and travel at border crossings with Canada, provide a reasonably priced, accessible and efficient alternative to air transportation, and speed up municipality-sponsored Amtrak station investments. Upstate New York's tourism industry, over \$12 billion of our economy, will be directly impacted by increased connectivity and ease of travel. All of Upstate's regions will be able to directly tap into the tourism markets of New York City, one of the most visited tourist destinations in the world.</p>
Response	<p>Thank you for your comments on the Tier 1 DEIS. The purpose of the High Speed Rail Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and to improve reliability, travel times, levels of train service and passenger amenities.</p> <p>Section ES-2.3 of the Tier 1 FEIS addresses program goals and objectives: "Improvements in service include tangible and measurable gains in operational reliability and travel time reductions of scheduled train trips; an increase in the frequency of train trips; and support of economic development, mobility and environmental sustainability goals." The Preferred Alternative, Alternative 90B, was selected based on its ability to provide these transportation and economic benefits, and improved access to businesses and institutions and other destinations should support continued economic development and tourism for the region.</p> <p>Thank you for your comments on Alternative 110 and the benefits of "Express Service." However, the "Express Service" option may not provide equal benefits to all of the riders on the route, and may leave some stations with less attractive service. The transportation operations, costs, and environmental impacts were considered as part of the the criteria used by the FRA and NYSDOT to select the Preferred Alternative. Because of the required property acquisition, Alternative 110 would have significantly higher costs and greater potential for environmental impacts than Alternative 90B, while only achieving a modest</p>

	improvement in overall performance. For these reasons, this alternative was dismissed from further consideration.
Commenter	Rodgers, Marilyn, Executive Director/CEO, Center for Restoration Arts & Sciences, Central Terminal Restoration Corporation, Center for Restoration Arts & Sciences, Central Terminal Restoration Corporation
Comment O-18-1	The Central Terminal Restoration Corp. (CTRC), as steward of the National Landmark known as the Buffalo Central Terminal wishes to acknowledge and endorse the Buffalo Common Council's adopted resolution on March 11, 2014 (attached for your review) regarding the Terminal's use for future High Speed Rail aka Empire Corridor Project – Tier I EIS.
Response	Thank you for your comments on the High Speed Rail Empire Corridor Program and the use of the former Central Terminal in Buffalo, New York. Buffalo Central Terminal was not included in the analysis of the Build Alternatives in the Tier 1 EIS, since the focus was on utilizing existing stations along the Empire Corridor, including the stations at Buffalo-Depew and Buffalo-Exchange Street. The building is on the north side of the main tracks at the west end of CSX Transportation's Frontier Yard and is not easily accessible for passenger trains. In the spring of 2017, the Governor and Mayor formed and participated in a Train Station Site Selection Committee, that also included elected, state, county, city officials, Amtrak, and other public and private transportation officials. The committee voted to approve a downtown station site closer to the existing Buffalo-Exchange Street Station over the Central Terminal location. Some of the primary reasons for the selection of the downtown site included economic benefits to the downtown business district, as well as population densities that support the transit use. Construction of a new terminal at the Buffalo-Exchange Street Station site finished in November 2020.
Commenter	Rodgers, Marilyn, Executive Director/CEO, Center for Restoration Arts & Sciences, Central Terminal Restoration Corporation, Center for Restoration Arts & Sciences, Central Terminal Restoration Corporation
Comment O-18-2	<p>The Terminal is an integral Tourism site in New York State due to its architectural design and transportation legacy.</p> <ul style="list-style-type: none"> - The CTRC is currently working with various future tenants and funders for a major adaptive reuse project of the Terminal which will, in turn, create educational opportunities, an active Arts center, workforce and economic development and neighborhood reinvestment in the Broadway Fillmore District of Buffalo, New York - The Terminal is centrally located within a two-mile radius of city-center - The Terminal also has secure parking facilities for up to 450 vehicles - The Terminal already has a Main Concourse for travelers to dine and shop adding to the tourism and economic values for entrepreneurship and small business development - The Terminal will also house education classrooms and shared space accommodations for local, regional, state and national colleges and universities to locate essential classes for certification and degreed programs in adaptive reuse studies thereby creating a benchmark for historic rehabilitation and restoration <p>That the Common Council supports the amendment of the High Speed Rail Empire Corridor Program to include the revitalization of the New York Central Terminal on Memorial Drive as an Intermodal Train Station in the City of Buffalo</p>
Response	Thank you for your additional comment on the Buffalo Central Terminal, and it has been included in the documentation of comments from the public on the program. A notation has been added to the Tier 1 FEIS, noting the public support for this historic structure.
Commenter	Maurer, Paul D., Central Terminal Restoration Corporation, Central Terminal Restoration Corporation

Comment 0-18-3 I am a volunteer board member of the Buffalo Central Terminal Restoration Corporation. Our historic and beautiful train station nears it's 85th birthday this June It lies along current live tracks in an area that would make a natural link to Downtown Buffalo. The resurgent area, now dubbed "Larkinville", is just a scant mile away from our soaring building. We would be a perfect location for a high speed rail station, with 500,000 square feet of space that would make for a breathtaking "front entrance" to Buffalo. Please consider this site as a viable replacement for the Amtrak Depew and Exchange stations.

Response Thank you for your comments on the High Speed Rail Empire Corridor Program and the use of the former Central Terminal in Buffalo, New York. The committee, tasked with evaluating prospective locations for a Buffalo Amtrak/bus station, including Central Terminal, voted to approve a downtown station site closer to the existing Buffalo-Exchange Street Station, for the reasons described in the response to Comment 0-18-1.

Commenter Cox, Tim, Certainteed Gypsum, Inc., Certainteed Gypsum, Inc.

Comment 0-19-1 we are concerned that the proposed high speed rail corridor would negatively affect business operations. Again, our ability to continue providing our customers with efficient, lower cost, reliable rail transportation is key to our success as well as the success of our customers. We urge you to consider the effects this will have on all rail shippers who greatly depend on rail service to meet demand in the NY and surrounding markets.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.

Commenter Cox, Tim, Certainteed Gypsum, Inc., Certainteed Gypsum, Inc.

Comment 0-19-2 We encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations. They also would impede the ability of the freight rail network to keep pace with and serve the needs of a growing upstate economy.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Improvement of passenger rail service, while maintaining freight operations along the Empire Corridor, is one of the goals for the HSR Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. The importance of preservation and the improvement of freight rail traffic to the economy of New York State has been a critical factor in the selection of a Preferred Alternative.

Commenter	Funke, Douglas J., President, Citizens for Regional Transit, Citizens for Regional Transit
Comment O-20-1	Citizens for Regional Transit (CRT) strongly supports high-speed passenger rail in NYS
Response	Thank you for your comments in support of the High Speed Rail Empire Corridor Program, which have been considered by the FRA and NYSDOT in the selection of the Preferred Alternative.
Commenter	Funke, Douglas J., President, Citizens for Regional Transit, Citizens for Regional Transit
Comment O-20-2	CRT urges that the alternatives should include significant improvements to the two Amtrak stations in Buffalo The current Depew Station does not adequately serve city residents and the current Exchange Street Station cannot handle westbound trains. A new train station within the city of Buffalo is needed. The future downtown Buffalo station serving HSR should offer seamless integration with local public transit, especially the light rail system. The Depew station is inadequate for current passenger access and for future HSR. A better location is the historic Central Terminal.
Response	Thank you for your comments on the High Speed Rail Empire Corridor Program and the use of the former Central Terminal in Buffalo, New York. Improvement to the passenger rail facilities in the City of Buffalo area is an important goal of the High Speed Rail Empire Corridor Program. NYSDOT has implemented upgrades at the existing rail station at Buffalo-Depew to improve/rehabilitate the parking lot and enhance passenger access to comply with Americans with Disabilities Act requirements. The focus was on utilizing existing stations along the Empire Corridor, including the stations at Buffalo-Depew and Buffalo-Exchange Street. Buffalo Central Terminal was not included in the Build Alternatives in the Tier 1 EIS. The building is on the north side of the main tracks at the west end of CSX Transportation's Frontier Yard and is not easily accessible for passenger trains. In the spring of 2017, the Governor and Mayor formed and participated in a Train Station Site Selection Committee, that also included elected, state, county, city officials, Amtrak, and other public and private transportation officials. The committee voted to approve a downtown station site closer to the existing Buffalo-Exchange Street Station over the Central Terminal location. Some of the primary reasons for the selection of the downtown site included economic benefits to the downtown business district, as well as population densities that support the transit use. Construction of a new terminal at the Buffalo-Exchange Street Station site finished in November 2020.
Commenter	Funke, Douglas J., President, Citizens for Regional Transit, Citizens for Regional Transit
Comment O-20-3	Second, along with providing a reliable connection between Buffalo and Niagara Falls, high-speed rail should offer continuing service to Toronto.
Response	Thank you for your comment that points out the opportunities on the western end of the Empire Corridor with connections in Canada. The program will improve service that operates along Empire Corridor, including Maple Leaf service that continues into Toronto.
Commenter	Funke, Douglas J., President, Citizens for Regional Transit, Citizens for Regional Transit
Comment O-20-4	My name is Doug Funke. I am the president of Citizens for Regional Transit. It looked like there wasn't a lot of resources being applied to a new train station for the options that were not the 125-mile an hour option, and we feel that the train stations here

in Buffalo are pretty dysfunctional and need some significant improvement. We need new stations no matter what option, so we would support that.

Response Thank you for your comments on the High Speed Rail Empire Corridor Program and the need for a new station in Buffalo, New York. Recent station upgrades include state-of-good-repair and accessibility improvements at the Buffalo-Depew Station in 2013 and completion of a new Buffalo-Exchange Street Station in 2020.

Commenter **Funke, Douglas J., President, Citizens for Regional Transit, Citizens for Regional Transit**

Comment O-20-5 As far as which option, I would agree with Mayor Dyster that the 125 would be the best but we recognize that we have the same budget and schedule and we want to get something done. We want to see something get done as quickly as possible.

Response Thank you for your comment supporting the 125 Alternative. The Preferred Alternative, Alternative 90B, was selected over Alternative 125, based on its substantially lower costs, impacts, and its performance. Alternative 90B would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Because it is situated largely within the existing right-of-way, it can be constructed in substantially less time than Alternative 125 and will begin to confer benefits within 2 to 5 years after start of construction. Unlike the 125 express service, which would bypass existing stations at Schenectady, Amsterdam, Rome, Utica, and Buffalo-Depew, it will improve service to these existing stations.

Commenter **Funke, Douglas J., President, Citizens for Regional Transit, Citizens for Regional Transit**

Comment O-20-6 Finally, the most important point is whatever is developed in terms of high speed rail, it needs to get with local transportation, local transit, preferably with a light-rail system so a new station needs to be able to also integrate and accommodate our light-rail system preferably.

Response Thank you for your comments on the Tier 1 DEIS and your support. The purpose of the High Speed Rail Empire Corridor Program is to introduce higher passenger train speeds on the Empire Corridor and to improve reliability, travel times, levels of train service and passenger amenities, along the Empire Corridor between New York City and Niagara Falls. Opportunities for connecting to other transit systems will need to be part of future efforts of the communities and stakeholders along the route.

Commenter **Wilson, Don, CMC Commercial Metals, CMC Commercial Metals**

Comment O-21-1 As a company in Columbia, SC that manufactures steel products and ships approximately 150 railcars annually into New York (primarily Brooklyn), we rely on the existing freight rail network for the efficient, reliable and economical transportation of goods. Compromised or limited service on the current freight network may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier

1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.

Commenter **Wilson, Don, CMC Commercial Metals, CMC Commercial Metals**

Comment
O-21-2 I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Improvement of passenger rail service, while maintaining freight operations along the Empire Corridor, is one of the goals for the HSR Empire Corridor Program. Minimizing interference with freight rail operations is one of the six performance objectives of the High Speed Rail Empire Corridor Program. Commenter **Piazza, David, Community Suffolk Inc., Community Suffolk Inc.**

Comment
O-22-1 Community-Suffolk, inc. is a family owned wholesale produce company that has been in business for three generations. Our business deals with perishable items that rely on freight rail to deliver products fresh to our customers. If this goes into affect the CSX freight rail network would be significantly delayed resulting in delinquent, compromised product to our facility. Fresh produce is prone to acteria and breakdown if not delivered in a timely fashion. This practice would cause an increase to our costs of having to find other ways of transport which would result in higher costs passed along to our customers. In today's economy, people just can not afford higher prices.
Compromised service on the current freight network, resulting from the operation of high speed passenger rail, may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.
I urge the state to consider the impact on freight rail operations when selecting an alternative.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.

Commenter **Piazza, David, Community Suffolk Inc., Community Suffolk Inc.**

Comment
O-22-2 In selecting an option, I encourage the state to maintain freight connectivity and the capacity to expand such service in the future by not commingling freight and high speed rail operations.

Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. As outlined above, this alternative would provide additional trackage and would improve both passenger and freight rail capacity and operations.
Commenter	Ali, Syd, Cornerstone Chemical Co., Cornerstone Chemical Co.
Comment O-23-1	I am concerned that the proposed high speed rail corridor would negatively affect business operations. Compromised or limited service on the current freight network may force my company to alter our business operations and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The long-term impact of the Preferred Alternative on energy and greenhouse gas emissions will be positive, by reducing automotive trips. .
Commenter	Ali, Syd, Cornerstone Chemical Co., Cornerstone Chemical Co.
Comment O-23-2	I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.
Commenter	Clay, Timothy, Cornerstone Systems, Cornerstone Systems
Comment O-24-1	I do have concerns that the proposed high speed rail corridor would negatively affect business operations. Cornerstone Systems, Inc. moves over 8,000 intermodal and boxcar shipments annually into the New York area. Our volumes are growing approximately six percent per year because of the consistent and reliable service provided by the railroads. The potential for slower service would negatively impact our business resulting in more trucks on the highway and more carbon in the environment.
Response	Thank you for your comment on the HSR Empire Corridor Program. The Preferred Alternative will provide additional trackage (approximately 370 miles) to improve freight and passenger railroad operations on the Empire Corridor, and your comment has been considered in the selection process for the Preferred Alternative.
Commenter	Clay, Timothy, Cornerstone Systems, Cornerstone Systems

Comment O-24-2 I support the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, which I believe would significantly constrain current freight rail operations.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.

Commenter Dorlon, Daniel, Covanta, Covanta

Comment O-25-1 As a company with significant Energy-from-Waste (EfW) operations in New York and a long-term contract with the City of New York to transport and dispose of residential waste generated in Manhattan and Queens, I appreciate the state's continued focus on economic development and pro-business efforts, but I am concerned that the proposed high speed rail corridor would negatively affect our business operations and the City of New York's plan for reducing the impact of waste transportation on the communities that it's waste travels through by truck

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of a Preferred Alternative.

Commenter Dorlon, Daniel, Covanta, Covanta

Comment O-25-2 I strongly encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.

Commenter Nixon, Robert F., President, Diversity Matters 2 US, Diversity Matters 2 US

Comment O-26-1 In order to maximize opportunities for small minority- and woman-owned disadvantaged businesses, separate DBE/MBE/WBE goals should be assigned to the construction of the track, stations, wayside equipment and railcars. Stakeholders in determining the number of "ready, willing and able" DBEs should include prime contractors, major system suppliers, and Bes/MBEs/WBEs.

Since minorities and women represent a majority of the ridership, they must represent a significant proportion of the supplier base.

Response Thank you for your comments on the program. The High Speed Rail Empire Corridor Program has been meeting the goals, and is committed to the participation by Woman Business Enterprises (WBE) and Disadvantaged Business Enterprises (DBE), as required by New York State government. The program is compliant with New York State Department of Transportation goals for Disadvantaged Business Enterprises.

Commenter Nixon, Robert F., President, Diversity Matters 2 US, Diversity Matters 2 US

Comment 0-26-2 I think if you want to sell this to the voters on the western corridor, it's 125 or bust, because I think the incentive really has to be High Speed Rail. Some of the other alternatives just increases the speed a little bit.

Response Thank you for your support of the 125 Alternative. The Preferred Alternative, Alternative 90B, was selected over Alternative 125, based on its substantially lower costs, impacts, and its performance. Alternative 90B would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Because it is situated largely within the existing right-of-way, it can be constructed in substantially less time than Alternative 125 and will begin to confer benefits within 2 to 5 years after start of construction. Unlike the 125 express service, which would bypass existing stations at Schenectady, Amsterdam, Rome, Utica, and Buffalo-Depew, it will improve service to these existing stations.

Commenter Nixon, Robert F., President, Diversity Matters 2 US, Diversity Matters 2 US

Comment 0-26-3 After this first phase is approved -- and it will be approved in my opinion -- and the RFPs are developed, I hope we look at the opportunities for small women and minority owned businesses on the track work, train stations, the locomotives and the wayside equipment.

Response Your comment highlights an important part of the High Speed Rail Empire Corridor Program in creating economic opportunities as part of the process. The New York State Department of Transportation is committed to supporting the opportunities for "Disadvantaged Business Enterprises" and has a program that supports these goals. Further information is available at: <https://www.dot.ny.gov/main/business-center/civil-rights/dbe>

Commenter Gualtieri, Joseph, DSA, DSA

Comment 0-27-1 As a distribution company with significant rail customers shipping via rail thru NY, I appreciate the state's continued focus on economic development and pro-business efforts, but I am concerned that the proposed high speed rail corridor would negatively affect business operations.
Compromised or limited service on the current freight network may force our customers to alter their business distribution methods and begin shipping more products by truck – increasing cost, increasing our environmental footprint and increasing traffic on New York roadways.

Response Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail.

Commenter Gualtieri, Joseph, DSA, DSA

Comment O-27-2	I encourage the selection of the base alternative to maintain our ability to easily use and rely on the freight rail network for safe, reliable and efficient service. The proposed 90A, 90B, and 110 alternatives put forth in the DEIS commingle freight and high speed rail, significantly constraining freight rail operations.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program, which have been considered by FRA and NYSDOT in the selection of Alternative 90B as the Preferred Alternative. This alternative will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail and will involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered.
Commenter	Gomez, Richard, East Coast Warehouse & Distribution Corporation, East Coast Warehouse & Distribution Corporation
Comment O-28-1	As a company that relies on Freight Rail service to my distribution center, I am concerned that there may be some changes that will affect the timely manner in which I receive my shipments from Canada. The commodity only has a short life and my customer believes in just in time product flows. Adding any time needed to ship to me will adversely affect our ability to turn the product as low cost as possible. any delays will mean lost sales. I am against any sharing of the freight system rail lines without adding additional safeguards to maintain or reduce lead times in the freight rail network.
Response	Thank you for your comments on the Tier 1 DEIS for the High Speed Rail Empire Corridor Program. Important goals for the program include improving travel times on the Empire Corridor, increasing the frequency of service and enhancing passenger amenities. Other goals of the program include using the improved intercity rail passenger service to promote economic activity along the route and increasing the attractiveness of the region for business. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional trackage to better segregate passenger and freight rail. Specifically in the Tier 1 EIS, Chapters 3 and 4 discuss the positive impacts of the program, with Section 4.3 Regional Population and Employment, and Business Districts, discussing how the program will create employment opportunities and support the labor markets in the regions served by the improved rail service. The importance of preserving and improving freight rail traffic to the economy of New York State has been an important factor in the selection of the Preferred Alternative.
Commenter	Becker, Bruce, President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-1	On behalf of the Empire State Passengers Association (ESPA), I am submitting the following information in support of the 110MPH alternative ESPA is pleased to provide its unqualified support for the 110mph alternative. We believe that this option provides the best opportunity to significantly increase ridership and fundamentally shift travel patterns in the years to come.
Response	Thank you for your comment supporting Alternative 110 and the benefits from high speed rail. Alternative 90B, the Preferred Alternative, would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered (see Exhibit 6-8 in the Tier 1 FEIS). Moreover, Alternative 90B would incur lower costs and fewer environmental impacts than Alternatives 110. For these reasons, this alternative was dismissed from further consideration.
Commenter	Becker, Bruce, President, Empire State Passenger Association, Empire State Passenger Association

Comment O-29-2	When financing resources are being considered, we strongly encourage the investigation of innovative funding solutions, including public-private partnerships and station-area development interest participation.
Response	Suggestions from the public have been considered, and opportunities for innovative funding solutions could be explored in the future during Tier 2 assessments. .
Commenter	Becker, Bruce, President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-3	I am the president of Empire State Passenger Association. After careful consideration of the presented information and options, ESPA is pleased to announce it's unqualified [sic] to work with the 110 mile per hour alternative. We believe that this option provides the best opportunities to significantly increase ridership and fundamentally shift travel time. A fully built 110 alternative will reduce travels time between Buffalo and Albany by an hour and provide for trips of just over six and a half hours from Buffalo to midtown Manhattan.
Response	Thank you for your comments in support of the 110 Alternative. For reasons of safety, CSXT, the owner of the right-of-way, requires a 30-foot track separation between freight and passenger tracks when passenger trains operate at 110 mph. In many places on the route, this is only possible by acquiring significant additional property. Alternative 90B would provide substantial travel time savings, but would constrain more of the additional trackage within the existing right-of-way than Alternative 110. Based on this, and resulting lower costs and impacts, Alternative 90B has been selected as the Preferred Alternative.
Commenter	Becker, Bruce, President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-4	It could be a substantial economic driver for the entire upstate region.
Response	We agree with your comment that the High Speed Rail Empire Corridor Program will be an important economic driver to the region. Key goals of the program are to improve service reliability, frequency of service, and train speeds.
Commenter	Becker, Bruce, President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-5	It would be a catalyst for economic development near the stations. We are here in Buffalo have a particularly good position to take full advantage of such development with the new downtown station located in close proximity to the medical center, the harbor center, and our emerging walkway.
Response	Thank you for your comments on the High Speed Rail Empire Corridor Program. The Buffalo-Exchange Station has recently been reconstructed and a new station building constructed, which should provide improved access and benefits economic development.
Commenter	Becker, Bruce, President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-6	While funding sources for this ambitious alternative have not yet been determined, it must be kept in mind that required projects would be completed in phases over multiple years. The alternative overall cost would be paid for in management projects. Financial resources are being considered to be strongly encourage the investigation of innovative funding solutions will be public/private partnerships and stationary developmental participation.

Response	Thank you for your comments on funding and program staging. Comments from the public on the financing and construction were considered in the development of the phased implementation presented in the Service Development Plan.
Commenter	Cabal, Andrew, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-7	I am Andrew Cabal and I am a councilman of the National Association of Railroad Passengers out of Washington as well as the Empire State Passengers Association, which is New York's local rail advocacy group First of all, ESPA supports the DEIS 110 mile per hour alternative option because this option allows for future improvement projects across the Empire Corridor necessary to increase the maximum operating speed to 110 miles an hour in locations where such speeds are possible, cost effective and beneficial.
Response	Thank you for your comment supporting the 110 Alternative and the benefits from high speed rail. Because of the required property acquisition, Alternative 110 would have significantly higher costs and greater potential for environmental impacts than Alternative 90B, while only achieving a modest improvement in overall performance. For these reasons, this alternative was dismissed from further consideration.
Commenter	Cabal, Andrew, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-8	The hundred the -- high speed does not -- does not include either Utica or Schenectady or other stations such as Rome or Amsterdam. That should be understood because a lot of trips -- a lot of trips are made from Syracuse especially to Utica and to Schenectady.
Response	Your comments about preserving and offering intercity rail passenger service for the City of Utica have been considered by the FRA and NYSDOT in the selection of the Preferred Alternative. Alternative 125 was designed to help cut the distance between Albany and Syracuse by 14 miles, but one of the major drawbacks of this route is that it passes to the south of the stations on the current Empire Corridor in the Mohawk Valley between Syracuse and Albany. Therefore, express service would not serve Rome, Utica, Amsterdam and Schenectady. The Preferred Alternative, Alternative 90B, was selected over Alternative 125, based on its substantially lower costs, impacts, and its performance. As discussed in Chapter 3 of the Tier 1 FEIS, the Preferred Alternative would increase service to Utica.
Commenter	Cabal, Andrew, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-9	And a little extemporaneous here, the high speed systems throughout the world, especially in France and in Germany and in Spain, they came about by incremental improvement, utilizing existing tracks in every locations, especially in the major cities, with high speed lines built in the interlands, if you will. It's the same way the thruway system was built in this country.
Response	Thank you for your comments on how to incrementally develop the high speed rail service on the Empire Corridor. The selection of the Preferred Alternative included consideration of constructability, and one of the advantages of Alternative 90B is that more of the additional trackage is constrained to the existing right-of-way (than Alternatives 110 or 125) and benefits can accrue within 2 to 5 years of the start of construction. The program schedule is outlined in the Service Development Plan, and building individual segments and supporting infrastructure, based on identification of funding and other factors, may follow an incremental approach to bringing the program into revenue service.
Commenter	Cabal, Andrew, Empire State Passenger Association, Empire State Passenger Association

Comment 0-29-10	Just a couple of things that I think Upstate should know about their rail heritage: Between Syracuse and Utica, the running time -- up until the late 1960s, the running time was of the fastest of the top ten trains in the country, Syracuse to Utica. A little bit -- a little bit of trivia. And, also, during the administrations of Governor Malcolm Wilson, remember him, he came after Rockefeller, and Governor Hugh Carry -- Malcolm Wilson, by the way, did a lot of work for -- for passenger rail. He, through his administration, improved the trip times between New York City and Albany from what was almost three hours to today's times of about two hours and 10, 2 hours and 20 minutes. Now, back then, it was also promised in the Transportation Bond Act, I think of 1979, that they would have an hour and 55 minute times between Albany and Syracuse, an hour and 55 minutes times between Syracuse and Buffalo. That was in 1979 that was promised to the true Upstaters. And it's 2014 now and we are nowhere near those trip times. So, hopefully, with the hard work that you are doing, we'll be able to achieve those in hopefully my lifetime.
Response	Thank you for your comments discussing the importance of Utica on the route and your support for the High Speed Rail Empire Corridor Program. The Preferred Alternative, Alternative 90B, would improve service to Utica and these other western cities.
Commenter	Godfrey, Ben, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-11	Hello, my name is Ben Godfrey and I'm with the Empire State Passenger Association. We're a state-wide advocacy group for improved rail passenger services in the state, and as a group, we vote for the 110 miles per hour. From an engineering standpoint, we think the HNTB, the DOT, and the FRA have done a great job doing this engineer study. Having said that, I support the 110 as the most feasible option for an engineering standpoint.
Response	Thank you for your comment supporting the 110 Alternative and the benefits from high speed rail. Public participation in the program has been an important part of the selection process for the Preferred Alternative. Because of the required property acquisition, Alternative 110 would have significantly higher costs and greater potential for environmental impacts than Alternative 90B, while only achieving a modest improvement in overall performance. For these reasons, this alternative was dismissed from further consideration.
Commenter	Godfrey, Ben, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-12	With regard to the study here, it seems to me that ridership estimates seem quite low.
Response	Thank you for your evaluation of the ridership levels in the Tier 1 DEIS. Estimates for the ridership in the Tier 1 EIS were forecast for primarily trips that began and ended along the Empire Corridor between New York City and Niagara Falls. Additional ridership may be present on the line for those riders on trains that serve areas outside the Empire Corridor that are not part of the High Speed Rail Empire Corridor Program.
Commenter	Godfrey, Ben, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-13	I also think the study is not fully taking into account CSX's expanding operations out of there. I think CSX itself is going to need additional track capacity just to handle their freight business which is growing pretty dramatically at this point.
Response	Thank you for your comments on CSX operations on the Empire Corridor. In developing the operating plans and train performance simulations for the High Speed Rail Empire Corridor Program, CSX Transportation had the opportunity to provide input in formulating the

	criteria and rail operations forecasting. CSX Transportation provided information supporting the expansion of their operations in the future.
Commenter	Greenhagle, Karl, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-14	I represent the Empire State Passengers Association, Our committee has analyzed all the various plans proposed and our organization supports the 110-mile-per-hour plan. And that's the reason why, because we feel that was the most feasible at the least amount of cost and you get the greatest benefit.
Response	Thank you for your comment supporting the 110 Alternative and the benefits from high speed rail. Alternative 90B, the Preferred Alternative, would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered (see Exhibit 6-8 in the Tier 1 FEIS). Moreover, Alternative 90B would incur lower costs and fewer environmental impacts than Alternatives 110. For these reasons, this alternative was dismissed from further consideration.
Commenter	Greenhagle, Karl, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-15	it should be a dedicated set of rails for passenger service
Response	Thank you for your comments on providing a dedicated tracks for passenger trains, which have been considered as part of the review of the Tier 1 DEIS. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional tracks to better segregate passenger and freight rail.
Commenter	Greenhagle, Karl, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-16	our organization is really promoting the 110. But I must give you a footnote: Personally, I like the 120 (sic). And I think when you look at these type of long-range capital investments, you need to look further out. And I think we need to go for the higher technology.
Response	Thank you for your comments on the 125 Alternative, which have been considered by the FRA and NYSDOT in the selection process for the Preferred Alternative. The Preferred Alternative, Alternative 90B, was selected over Alternative 125, based on its substantially lower costs, impacts, and its performance. Alternative 90B would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered. Because it is situated largely within the existing right-of-way, it can be constructed in substantially less time than Alternative 125 and will begin to confer benefits within 2 to 5 years after start of construction. Unlike the 125 express service, which would bypass existing stations at Schenectady, Amsterdam, Rome, Utica, and Buffalo-Depew, it will improve service to these existing stations.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-17	I'm vice president of the Empire State Passenger's Association. We are a statewide organization looking at improving both rail and public transit throughout the State of New York and the major cities of New York State. I would like to give our organization endorsement of the 110 option

Response	Thank you for your comments supporting the 110 Alternative and the benefits from high speed rail, which have been considered in the selection process for the Preferred Alternative. Alternative 90B, the Preferred Alternative, would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered (see Exhibit 6-8 in the Tier 1 FEIS). Moreover, Alternative 90B would incur lower costs and fewer environmental impacts than Alternatives 110. For these reasons, this alternative was dismissed from further consideration.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-18	One of the issues with the 90-A and 90-B options is they just do not have enough track capacity in order to have the service provided, especially when you figure it is one of the busiest freight lines, which is the freight line owned by CSX. Also, reducing the travel time from Albany to New York down to two hours we believe is very key
Response	Thank you for your comments on the 90A and 90B Alternatives in the Tier 1 DEIS. Specific track diagrams and operating programs were developed for each of the alternatives discussed in the Tier 1 EIS for the High Speed Rail Empire Corridor. This information was then used to support the modeling and simulation of operation over the track layouts in each of the alternatives. The Preferred Alternative, Alternative 90B, will provide approximately 370 miles of additional tracks to better segregate passenger and freight rail.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-19	One of the issues with the 125 mile-per-hour option is not only does it bypass several cities in upstate New York, but we believe taking existing land that is not part of our corridor right now for freight travel or passenger travel is just not a good option at the cost of 15 billion.
Response	Thank you for your comment on the 125 Alternative. This alternative has been dismissed from further consideration, and the factors outlined in your comment were among the reasons it was deemed inferior to the Preferred Alternative (Alternative 90B).
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-20	The better transit connections are also key, along with increased parking, cities such stations as Rhinecliff and Buffalo need additional parking.
Response	Thank you for your comments on improving the connections along the Empire Corridor. Improving the intermodal connections along the Empire Corridor is one of the focuses of the High Speed Rail Empire Corridor and NYSDOT. Improvements, including parking, have been made at a number of new stations. These improvements include accessibility improvements at the Buffalo-Depew Station and new stations constructed at Buffalo-Exchange Street Station, Albany-Rensselaer, and Rochester. The needs can be reviewed for additional parking at stations, as station projects are studied and continue to advance, along the route.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment 0-29-21	The Alternative 110 is clearly the best option, with significant improvements for passengers and limited environmental concerns.

Response	Thank you for your comment supporting the 110 Alternative. Public participation in the program has been an important part of the selection process for the Preferred Alternative. Alternative 90B, the Preferred Alternative, would result in the best overall on-time performance for Amtrak service in 2035 and, at the same time, would involve the least delay-minutes per 100 train miles operated for freight trains of all of the alternatives considered (see Exhibit 6-8 in the Tier 1 FEIS). Moreover, Alternative 90B would incur lower costs and fewer environmental impacts than Alternatives 110. For these reasons, this alternative was dismissed from further consideration.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-22	I do question the travel time of several of the alternatives, especially the Alternative 110. The Alternative 110 should have a lower travel time New York City to Niagara Falls, as 7 hours 22 minutes would seem to include significant pad time. The goal of Alternative 110 should be 2 hours NYC to Albany, 4 hours Albany to Buffalo-Depew, and 45 minutes Buffalo-Depew to Niagara Falls. I think presenting the actual travel time without pad time of actual schedules would show the travel time in a clearer way.
Response	Thank you for your comments on the travel time estimates for the various alternatives considered in the Tier 1 DEIS. The travel times for the different segments of the route for each of the alternatives are discussed in Chapters 3 and 6 of the Tier 1 EIS. These were developed by using simulations of the Empire Corridor under different scenarios and equipment assignments.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-23	The repeated assertion that Alternative 125 would be 100% on-time is not realistic.
Response	Thank you for your comment regarding on time performance of the Alternative 125. Targets for the on time performance for each of the alternatives were determined utilizing simulations of the Empire Corridor with different operating factors and interfaces with other traffic on the routes. Details of the analysis can be found in Appendix D of the Tier 1 FEIS.
Commenter	Prophet, Gary, Vice President, Empire State Passenger Association, Empire State Passenger Association
Comment O-29-24	Specific service items should be included, as they are imperative to any improvement in the passenger rail in New York State and include the following passenger rail service items: train from Syracuse that arrives NYC before 11 am, train from Saratoga/Schenectady that arrives NYP before 10 am, train from NYC to Niagara Falls that departs NYC after 3 pm
